ory Flynn (Michigan division) and August von Munchhausen (Saltus club) finished first, second and third in the order named. Norman Armitage (Fencers' club) again won the national sabre title with Tibor Nyilas and George Worth both of the Salle Santelli finishing second and third. In the National Women's championship Miss Helena Mroczkowska (Fencers' club) placed first, Miss Ruth Maxwell (Fencers' club) second and Miss Maria Cerra (Salle Santelli) third.

The Big Ten conference operating on a very reduced schedule held the annual conference meet at the University of Chicago. The team championship was won by the University of Illinois. In the individual championships Arthur Cohen (University of Chicago) placed first in foil, Robert O'Donnell (University of Chicago) first in épée and Ray Siever (University of Chicago) first in sabre.

The Michigan, California and New York divisions of the Amateur Fencers League of America were the most active of all the 29 divisions. In the New York division in the Metropolitan championships John R. Huffman won the foil, Tibor Nyilas the sabre and Al Schrobisch the épée. Ambitious schedules were successfully followed and new names appeared among the older and familiar ones in the championships. The Texas, Philadelphia, St. Louis, Illinois and Northern Ohio divisions suffered due to the loss of men to the armed forces. Competitions were held, however, in schools and colleges and fencing in these areas was far from extinct. The remaining 20 divisions scattered about the United States were largely inactive as far as formal competition was concerned. (H. J. Z.)

Fertilizers. The international fertilizer situation was materially changed in 1943 by the shifting of control in the Mediterranean and by the reduction of the submarine menace. North African countries normally produced annually about 4,000,000 tons of phosphate rock, most of which was exported to Europe including the British Isles. In 1941 and 1942 the axis powers controlled and absorbed whatever tonnage was produced, and Great Britain was completely cut off. In 1939 Palestine produced 635,000 tons of potassium chloride which went largely to Great Britain. These sources of supply were again open for shipment to the Allied Nations.

The loss of phosphate raw material seriously affected axis food production, as well as their munitions program. Their domestic resources were small and difficult to operate. Nauru and Ocean island in the South Pacific produced in 1941 approximately 1,000,000 tons of phosphate rock, most of which went to Australia and New Zealand. After Dec. 1941, these islands were under Japanese control and no doubt were utilized to the utmost to furnish Japan with much needed phosphates. Bombing attacks by Allied Nations late in 1943 were reported to have damaged operating facilities severely.

Movement of Russian potash and phosphates and Spanish potash to Allied Nations became possible in late 1943, whereas practically no shipments had so moved after 1940. As shipments were resumed from these sources, the call for shipments from the United States would be lessened and adequate supplies for American agriculture would be available.

The demand for increased food, feed and fibre production in the United States to supply the armed forces, to fulfil lend-lease commitments, to help feed the peoples of reoccupied countries, and to meet domestic civilian needs greatly increased the demand for fertilizers. Requirements for nitrogen for the manufacture of explosives and other munitions caused a definite shortage of that material in 1943 for use by agriculture. The construction of new synthetic nitrogen plants and changes in the munitions program greatly relieved the nitrogen shortage. Approximately 625,000 tons of nitrogen were expected to be available to American agriculture for the crop-planting year ending June 30, 1944, as compared to 460,000 tons the previous year. Demand for increased supplies of phosphates were met by speeding up production in all operating plants and constructing a few new ones. Production for the year ending June 30, 1944, was expected to approach 7,000,000 tons as compared to 5,144,000 tons produced in the 1942 calendar year. American production of potash in the year ending June 30, 1944, was expected to be about 700,000 tons expressed in terms of K_2O. Requirements for war chemicals and lend-lease left about 540,000 tons for agriculture, not enough to meet all demands but as much as was used any year except in 1942. Total fertilizer consumption in the United States in the 1943–44 year was expected to exceed 11,000,000 tons. (C. J. Br.)

Finland. An independent republic of northern Europe. Area, 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940. The boundary in 1943 was somewhat expanded. Pop. (census of 1940) 3,887,217. Capital, Helsinki; pop. (est. Jan. 1, 1939), 304,965. Other principal cities: Turku (74,315); Tampere (76,730); Viipuri (74,247). Language and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian. President in 1943: Risto Ryti (re-elected in Feb. 1943, and re-inaugurated on March 1); Prime Minister, Edwin Linkomies.

History.—Finland's position grew more desperate as 1943 progressed. The fiction of a separate war in the north could no longer be argued seriously. Finland was caught in the German vise.

Rumours of Finnish devices for peace and of the issuance of "feelers" were rife almost throughout the year. Russia was reported (probably falsely) to have made a peace offer to Finland in Jan. 1943. U.S. Under-Secretary of State Sumner Welles in February appealed to the Finnish people to pull out of the war.

Also in February Björn Prytz, Swedish minister in London, journeyed hastily to Stockholm, and rumours flew that he was to be intermediary in a Finnish-Russian peace move. Through March and April the rumours gradually died out, and in May a group of U.S. leaders signed a petition for a U.S. declaration of war on Finland. In April all but one U.S. diplomatic officer were removed from Helsinki, and only this token representation was maintained as chargé d'affaires (Robert McClintock until mid-November, succeeded by George L. West, Jr.). In Aug. 1943 some 33 Finnish politicians sent to the government a request for peace. At approximately the same time Eero Vuori, chief of the Finnish Trade Union congress, met in Stockholm with Arthur Deakin, official of the British Transport and General Workers union; peace was the issue, but no results showed. Through September and October suggestions of peace proposals continued. Premier Linkomies in September expressed regret at being at war with Great Britain and hoped that Finland could withdraw from the war with the U.S.S.R. Vaino Tanner, finance minister and ardently anti-soviet, made a radio address urging that Finland be realistic and make a "reasonable" peace with Russia. But 1943 passed with no agreement, and all that was really sure was that Russia and Finland had not agreed on what was reasonable. Russian propaganda continued to be as harsh toward the Finns as toward the Germans and pointed out that the Finns, while winning, had seemed quite eager to participate in the results of a Hitler New Order.

From a purely military standpoint the war in the north remained a stalemate, with only minor border forays and slight movement. Perhaps Col.-General Eduard Dietl and the German forces were concerned largely with their relations with the Finns; and certainly the Finns were not eager to risk increased casualties for futile conquests.

The food situation was bad, but good harvests and 30,000 tons of grain from Germany gave Finland about a six-month supply. Nevertheless, dependence on Germany for supplies may have been the chief factor holding the country to an allegiance of which it had completely sickened. Industrial production dropped, according to Moscow reports, to 35% of normal. Some trade was still carried on with Sweden, and in Dec. 1943 an agreement was signed for the first 6 months of 1944, providing a Swedish credit of 5,000,000 kronor to Finland for purchases in Sweden. Trade agreements were also negotiated with Germany, Denmark and Spain.

Payment of the much-discussed debt to the U.S. was resumed in June 1943, and in October Finland agreed to a plan to repay the instalments missed in 1941 and 1942 over a period of ten years.

At least 11,000 Ingermans, descendants of Finns who moved some 250 years ago to the region southeast of Leningrad, were sent to Finland in 1943 by the Germans, and about 25,000 more were expected. Starvation and hardship had played havoc with these people, but the Finns were glad to welcome their distant kinsfolk.

A presidential election was held on Feb. 15, 1943, resulting in the re-election of Risto Ryti by 269 votes out of 300. On his re-inauguration on March 1, the first time any Finnish president had succeeded himself, the cabinet resigned according to custom. The reshuffling, after some delay, brought in as prime minister Edwin Linkomies, Conservative leader, chairman of the editorial board of the *Uusi Suomi,* and professor at the university. Sir Henrik Ramsay, Finn of Scotch descent, became foreign minister. The former holders of these key posts, J. W. Rangell and Rolf Witting, were probably the strongest pro-nazis in the cabinet. Marshal Mannerheim remained, at 75 years of age, head of the armies.

Few statistics of agriculture, finance, manufacturing, etc., reached the outside world after the first Finnish-Soviet "winter war" of 1939–40, and figures available at the end of 1943 still pertained mostly to 1938 and 1939.

Education.—In 1939 there were some 11,200 elementary schools, with 411,000 students and 13,500 teachers; 383 professional schools in 1937 with 20,583 students, 68 middle schools with 8,546 students, and 150 lyceums with 42,034 students. There were five universities, of which that at Helsinki was the largest (enrolment, 6,461 in 1938).

Finance.—The monetary unit is the Finnish markka (=2 U.S. cents approximately; at the last free quotation in 1939, 49 FM= $1). Foreign debt (Sept. 1939), 1,040,000,000 FM; internal debt (Sept. 1939), 2,810,000,000 FM; note circulation (April 1, 1941), 5,720,000,000 FM.

Trade.—Exports (1938) totalled 8,431,111,000 FM; (1940) 2,870,000,000 FM; imports (1938) 8,612,283,000 FM; (1940) 5,180,000,000 FM. Major export commodities, with their values in 1940 were as follows: pulp, paper, etc. 950,000,000 FM; timber and wood 1,200,000,000 FM; foods of animal origin 70,000,000 FM; metals and metal goods 200,000,000 FM; hides, skins, etc. 90,000,000 FM; minerals 80,000,000 FM. Major import commodities with values in 1938: metals and metal goods 1,420,500,000 FM; machinery and apparatus 1,120,300,000 FM; minerals 661,100,000 FM; colonial products 585,500,000 FM; oils, fats, waxes 503,300,000 FM; transportation equipment 482,900,000 FM. Great Britain, Germany and the United States were the leading importers of Finnish products, while the same three countries plus Sweden supplied most of Finland's imports.

Communication.—Railways (1938) totalled 3,530 mi. and carried 21,200,000 passengers and 15,710,000 tons of freight in 1937. Buses in operation numbered 2,500 in 1937; 20,300 mi. of main highways were maintained by the state. In 1938 there were 185,456 telephones in operation, 1,593 mi. of telegraph lines, 18 broadcasting stations and 293,790 radio sets.

Agriculture.—The chief crops in 1939, with their yields in short tons, were as follows: oats 879,635; wheat 250,222; barley 211,642; rye 364,861; potatoes 1,715,179. Livestock in 1937: 380,038 horses; 1,925,078 cattle; 1,072,307 sheep; 10,372 goats; 504,164 pigs; 100,356 reindeer; 2,814,960 poultry; 18,374 beehives.

Manufacturing.—In 1937 there were 4,264 establishments which employed 207,506 workers and produced goods valued at 21,076,045,000 FM. The chief products and their values were as follows: wood and paper 9,428,919,000 FM; food and luxuries 3,453,956,000 FM; textiles 2,264,267,000 FM; machinery 2,113,012,000 FM; metal 1,767,424,000 FM; leather and rubber 946,071,000 FM.

In 1940, after the winter war, there remained to Finland 3,896 industrial establishments and 175,622 workers. Total industrial production was valued at 19,915,000,000 FM.

Mineral Production.—Following are the chief mineral products of Finland and their output in 1938: pyrite ores 113,514 tons; pyrites (sulphur content) 48,811 tons; copper ore 15,542 tons; copper 13,483 tons; gold 3,858 oz.; and silver 57,900 oz.

(F. D. S.)

Fire Insurance: *see* INSURANCE.

Fires and Fire Losses.

The losses by fire, including lightning, in the United States as compiled by the National Board of Fire Underwriters for 1943 amounted to $380,235,000. This was an appreciable advance and probably was due to the pressure caused by war work. For approximately three years the manufacturing plants were taxed heavily, because they were operating not 8 hours per day as in

peacetime but 16 and in most instances 24 hours. This continual strain on machinery had its effect not only in starting fires but in spreading the damage once the fire started. Again, the changing personnel to be trained had to be taken into consideration, together with the changes in materials used in making the same form of product. Finally, another consideration was the change in the form of the product itself. The business is one in which inspection service, to see that all properties are kept in good order, plays a fundamental part. It suffered as much, if not more than most businesses, because skilled inspectors had been drawn from it into government work. (*See* also DISASTERS.) (E. R. H.)

Fires and Fire Prevention: *see* WARFARE, INCENDIARY.

Fish, Bert (1875–1943), U.S. foreign service official, was born Oct. 8 at Bedford, Ind. He studied law at the John B. Stetson university in Florida, was admitted to the bar in 1902 and practised in De Land, Fla., until 1926, when he became judge of the criminal court of Volusia county. He was appointed minister to Egypt, 1933, to Saudi Arabia, 1939, and to Portugal, 1941. Fish was chairman of the American delegation to the Capitulations conference held in Montreux, Switzerland, in 1937. He died at his post in Lisbon, July 21.

Fish and Wildlife Service: *see* WILD LIFE CONSERVATION.

Fisheries. The fisheries of the world, in normal times, annually yield about 17,500,000 tons of 2,000 lb. each, of food and industrial products, with a value of about $762,000,000. The fisheries conducted in the North Atlantic area by bordering countries produce 7,550,000 tons, valued at $374,000,000; with the production by eastern North Atlantic countries amounting to 6,100,000 tons, valued at $310,000,000, and by western North Atlantic countries to 1,450,000 tons, valued at $64,000,000. In 1943 as in 1942 the catch was below normal because of the difficulty of operating under war conditions. Prices, however, continued to advance sharply and fishermen received a high return for their catches. The species of importance in the North Atlantic area include herring, cod, haddock, mackerel, halibut, rosefish, swordfish, crabs, shrimp and oysters. In some of the warring countries conservation regulations continued to be relaxed in an effort to increase fish production, without regard to the effect of unrestricted operations on the maintenance of fish supplies in the sea.

As a result of the war, generally, operations by warring nations were considerably curtailed due largely to the loss of fishing craft to military forces. The remainder of the fleet found it difficult to conduct fishing on the usual banks. In order to make up for the deficiency of its domestic fisheries, Great Britain placed considerable dependence on supplies of salted, frozen and canned fish from Newfoundland and Canada; salted, fresh and frozen fish from Iceland; and canned salmon, sardines, mackerel and sea herring from Alaska, California and Maine. Because of difficulties in securing refrigerated cargo space on transports and of holding chilled fish in cold storage in England, the importation of frozen fish was retarded. Price orders and zoning systems of distribution continued in effect in England for most items of fresh and frozen fish.

While the situation in many sections of the world was not conducive to normal fishing operations during 1943, many countries took renewed interest in exploiting the fishery resources. For instance, New Zealand fish canners expanded the canning of mullet, kingfish and trevally. The Australian government continued its research program to increase the production of marine foodstuffs which were urgently needed to replace the former imports of these items, and a comptroller of fisheries was appointed to promote the more orderly marketing of fish.

The shrimp and shark fisheries on the west coast of Mexico continued to expand. Livers from the sharks were exported to the United States where they were used in the manufacture of vitamin A fish-liver oils. The fisheries of Peru expanded at a greatly accelerated rate, especially in the production of canned fish and fish livers. Quantities of salted fish were exported. Chile conducted a sizable fishery, a considerable portion of the catch being canned and marketed in other South American countries. A number of fishing boats were under construction in Chile and Peru. In Uruguay the fisheries continued at a lively rate. The government of Venezuela furthered its broad program to develop the food industries of the republic and the production of canned fishery products increased during the year. As in many countries of the world, the fish canning industry of Venezuela was seriously hampered by a scarcity of tin-plate from which to make cans; therefore steps were taken to provide methods of preserving the catch by salting.

Limited fishing activities were conducted in Germany and Italy, and in the axis-dominated countries of Norway, Denmark, Finland, the Netherlands, Belgium and France. Except in Italy, and possibly France, any exportable surpluses in the various countries were shipped to Germany. Even then consumption of fish in Germany was only about one-half of prewar levels.

The fisheries of North America, which normally yield over 3,000,000 tons on both coasts and in the interior waters, were prosecuted a little more extensively in 1943 than in the previous year, but still under 1941. The catch of fishery products in the United States and Alaska was estimated to have totalled about 1,875,000 tons compared with the record yield of about 2,400,000 tons in 1941. Declines in the catch were attributed to the requisitioning of fishing vessels by the armed forces, restrictions on the operation of fishing craft, and a shortage of fishermen and shore workers. In Newfoundland the catch of codfish was retarded because of adverse weather conditions early in the summer. In Canada the 1943 pack of salmon in British Columbia amounted to about 1,250,000 cases, a decrease of about 550,000 cases, compared with the previous year. Most of the pack was sent to the British Isles. Large shipments of canned herring were also sent to Great Britain from Canada.

In Newfoundland the export market for salt cod, which is the main outlet for this product, continued good and no difficulty was experienced in finding buyers for the production. The exports of salted cod from Newfoundland, as well as Canada, were made in conformity with international action taken through the Combined Food board. A large portion of the 1943 production of salted cod from Newfoundland was marketed to Spanish, Portuguese and Puerto Rican buyers.

The position of the fishing industry in the United States improved materially during 1943, brought about by a higher price structure. During the year the United States government continued the purchasing or chartering of fishing vessels for conversion into naval craft, some of which were replaced or returned.

Sealing operations on the Pribilof Islands in Alaska were greatly expanded, the take amounting to 117,000 seal skins, which was the largest for many years.

The production of canned salmon in Alaska was larger in 1943 than in the previous year, amounting to about 5,405,000 cases. A large portion of the pack was purchased by the government for military and lend-lease purposes. The total pack of canned salmon in North America (Alaska, British Columbia, Pacific coast states) amounted to 7,025,000 cases in 1943, compared with 7,644,000 cases in 1942. The total pack of canned fishery products in the United States and Alaska in 1943 totalled about 636,000,000 lb.,

FISHERMEN'S CRAFT at a cannery wharf in Vancouver, B.C. Wartime food demands spurred salmon fishermen to record hauls in 1943

compared with 660,646,000 lb. in the previous year. Supplies of canned fish available to United States civilians were far below normal because of heavy government purchases of salmon, sardines and mackerel for the armed forces and for shipment to the United Nations.

In order to conserve critical material and manpower, the Alaska salmon industry and the California sardine industry operated under a concentration plan of the co-ordinator of fisheries of the department of the interior.

In various countries of South and Central America further interest was shown in exploiting local fishery resources. Attention was directed mainly toward producing marine products for domestic consumption to replace foods from abroad. Under the U.S. government's program for co-operation with other American republics several were assisted in fishery matters.

Vitamins.—During 1943 interest was continued by various countries in securing an adequate supply of fish oils potent in vitamins A and D. In the United States the production of vitamin A from fish oils for the 12-month period ending Oct. 31, 1943 was estimated at 86.6 trillion units. The holdings in the U.S. as of Oct. 31 amounted to 54.7 trillion. Manufacturers of vitamin fish oils in the United States continued to exert efforts to augment supplies from domestic and foreign sources. The fishery on the Pacific coast for soupfin sharks, the liver of which is potent in vitamin A, was prosecuted intensively and large quantities of the meat were marketed commercially. Efforts were continued during the year to locate sources of vitamin-bearing fish oils in other American republics, in India, in the South Pacific and in West and South Africa.

Whaling.—During the two decades from 1920 to 1940 the whale fisheries of the world were prosecuted with renewed vigour. Operations were centred almost entirely in the Antarctic. Previously, little whale fishing was done in this area because of dangerous weather and ice conditions. In recent years, however, such adverse conditions were no obstacle to the staunchly-built factory ships and killer boats. The take was enormous. During the period from the season 1919–20 (the inception of the fishery on a large scale in the Antarctic) to the 1938–39 season, inclusive, 421,708 whales were captured in this region, from which 32,741,897 bbl. of oil were produced.

Because of war conditions complete data were not available on the whole production during the seasons 1939–43. (*See* also MARINE BIOLOGY.) (R. H. F.)

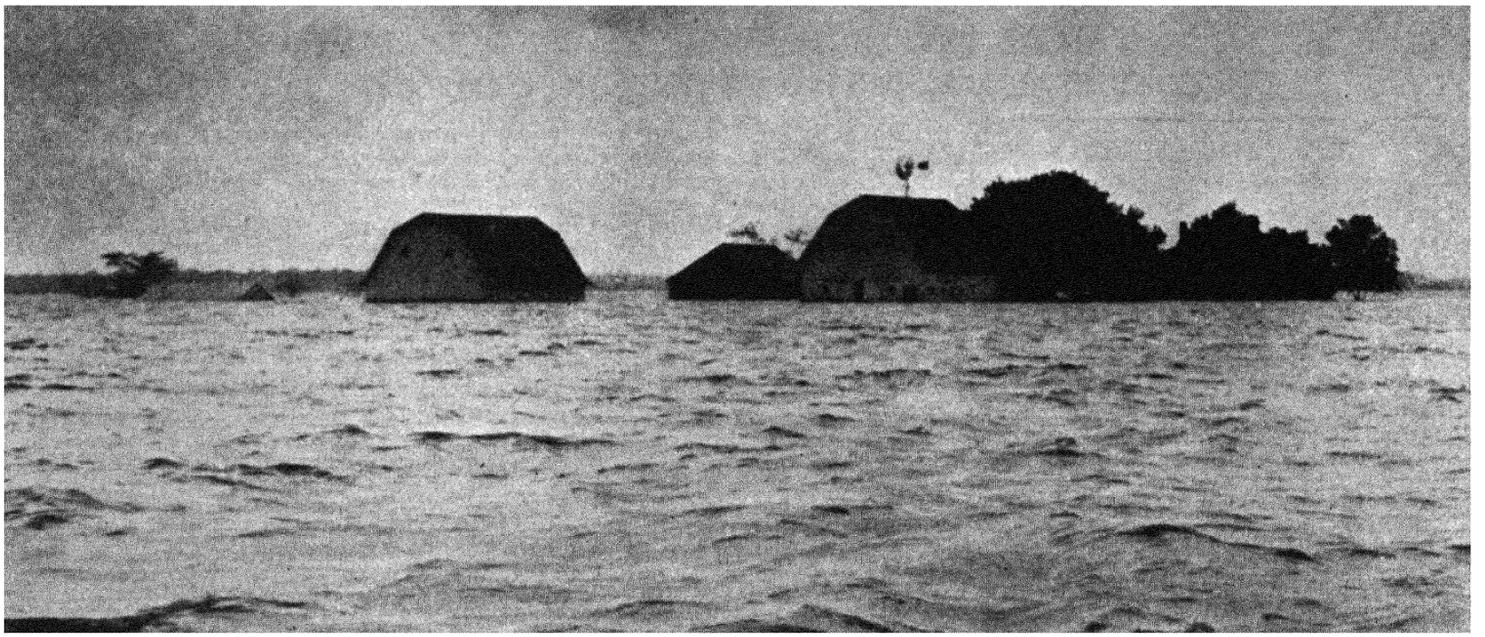
Fitzroy, Edward Algernon (1869–1943), British politician, was born July 24. He attended Eton and Sandhurst military academy and served in World War I with the First Life Guards. He was Conservative member of Parliament from south Northamptonshire (now Daventry division) almost continuously from 1900 to 1943 and was deputy chairman of committees in the commons, 1922–28. As speaker of the house from 1928 until his death, he directed the house sessions through some of the most troubled years in the empire's history.

A London dispatch of March 3 carried the report of his death.

Flax: *see* LINEN AND FLAX.
Flint: *see* ABRASIVES.

Floods and Flood Control. General flood control legislation provided, up to December 1943, authorizations totalling $930,400,000 for the construction of nearly 500 reservoirs and local protection projects widely dispersed throughout the United States, exclusive of the large project authorized separately for the alluvial valley of the Mississippi river.

The projects were integral parts of comprehensive and co-ordinated plans for the beneficial development of the water resources of the United States, and they provided economic flood protection for a large number of centres of population and for many thousands of acres of rich agricultural lands. Many of the reservoirs are suitable for advantageous development of multiple-purpose projects for flood control in combination with hydro-electric power and other water uses.



Work under the federal program for national flood control was started in 1937, when the first funds for that purpose were appropriated by congress.

By the end of 1943, 44 reservoirs and 101 local protection projects were placed in operation.

The program was thoroughly co-ordinated with the war effort of the United States. Although all flood control projects, being directly beneficial to the national economy, were directly or indirectly related to the war effort, the only new work initiated in 1943 was three projects determined to have direct value to the prosecution of the war. One of these was a multiple-purpose dam and reservoir project to provide flood protection and increased water supply for an important steel producing region, and the other two were local protection projects to give direct flood protection to industries supplying material to the army and navy. In 1943, work was continued on two multiple-purpose dam and reservoir projects, which were determined necessary to supply additional power for war industries.

Complying with existing federal policy, which required curtailment of public works not essential to the war, all projects under way prior to the announcement of this policy were or were being brought to completion or to a safe point of suspension. In many instances, completed portions of suspended projects afforded substantial amounts of flood protection.

An act of congress approved July 12, 1943, authorized the expenditure of $10,000,000 for emergency flood control work made necessary by floods which occurred in the spring of 1943. Work accomplished under the authority of the emergency act included repair, restoration and strengthening of existing levees and other flood control structures which were threatened or destroyed by floods in numerous localities of the country.

SUBMERGED FARMLAND on the Illinois side of the Wabash river west of Vincennes, Ind., in May 1943. Of the midwestern states, Illinois suffered the heaviest damages from the record spring floods

Work was being carried on as rapidly as practicable to complete plans and designs for the remaining portions of the suspended projects and for many additional authorized project. in order that a large-scale program of actual construction operations might be ready for initiation without delay at the end of the war. This backlog of economically justified projects was to be available to assist in the transition from war activities to a normal peacetime economy. (*See* also DAMS; FORESTS; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.) (E. RD.)

Florida. An extreme southeastern state of the United States, called the "Peninsula state" because of its peculiar outline. Its coast line is greater than that of any other state, extending 472 mi. along the Atlantic and 674 mi. along the Gulf of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are water surface; pop. (1940) 1,897,414, of which 1,045,791 were urban and 851,623 were rural; 1,384,365 white and 513,049 Negroes. Only about 60,000 were foreign born. Capital, Tallahassee (16,240). The larger cities are Jacksonville (173,065), Miami (172,172) and Tampa (108,391).

Florida in the census of 1940 gained an additional representative, who was chosen from the state at large in 1942, the state at that time not having been redistricted.

The state elective administrative officers, whose terms expire in Jan. 1945 are as follows: Spessard L. Holland, governor; R. A. Gray, secretary of state; J. Thomas Watson, attorney-general; J. M. Lee, comptroller; J. Ed. Larson, state treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

Education.—The biennial report of the state superintendent of public instruction, 1941–42, showed enrolment in the public schools through grade 12 as follows: white 282,629; Negro 104,260; total 386,889. There were 1,864 elementary and 708 secondary public schools in the state, with instructional staffs totalling 13,721 teachers, of whom 10,320 taught in the schools for whites and 3,401 in the schools for Negroes.

Public Welfare, Charities, Correction.—Florida disbursed for pensions, benefits and public welfare $13,470,878.91 in 1942–43. From grants by the federal government, the state received in 1942–43, for old-age pensions $3,875,922.36; for dependent children $726,954.79, and for pensions for the blind $277,322.81. The unemployment compensation benefit receipts were $2,210,000.00, with benefit disbursements of $2,365,747.69. Disbursements for old-age assistance were $7,319,077.17.

Florida has no state penitentiary, but in 1943 maintained a prison farm at Raiford, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The appropriation for these institutions for 1942–43 carried the sums of $665,394.82, $240,943.17 and $87,587.68 respectively. The state also supported a state hospital for the insane, the Florida Farm colony for the feeble minded and the Florida School for the Deaf and Blind. The total disbursements for charities, correction and hospitals for 1942–43 were $2,761,028.56.

Communication.—The total highway mileage in the state in 1942, exclusive of roads built for military purposes for which no figures are obtainable for publication, was 13,400 mi. approximately, of which about 8,000 mi. were paved or hard-surfaced. In 1942–43 disbursements by the state road department, including federal aid, were $10,711,185.28. Florida in 1943 had about 6,000 mi. of railroads.

Banking and Finance.—On June 30, 1943, there was a total balance in the treasury of $16,534,595.31. The state is constitutionally forbidden to incur a debt by borrowing except to put down rebellion or repel invasion. The constitution also inhibits the legislature from levying an income tax, and a constitutional amendment forbids any state *ad valorem* tax on real estate. Homesteads are constitutionally exempted from taxation by local taxing units up to the value of $5,000.

On June 30, 1943, there were within the state 54 national banks with deposits amounting to $722,423,000 and 113 state banks and trust companies with deposits of $250,251,000, representing total deposits of $972,674,000, a gain in deposits of $388,442,000 in the fiscal year.

Agriculture.—In 1940 the U.S. census showed that there were 62,248 farms with a total acreage of 8,337,708 ac., of which 1,751,275 were in crops, 462,248 were idle (fallow), 2,643,065 were in pasture, 1,649,960 were in farm woodland and the rest mainly in fruit.

Principal Agricultural Products of Florida, 1943 and 1942

Crop	1943	1942
Corn, bu.	8,151,000	7,413,000
Tobacco, lb.	14,810,000	14,778,000
Potatoes, bu.	3,703,000	4,116,000
Sugar cane, short tons	990,000	663,000

The citrus production for the season 1942–43 and the estimates for 1943–44 were as follows: oranges (including tangerines) 41,400,000 boxes and 42,700,000 boxes; grapefruit 27,300,000 boxes and 25,000,000 boxes.

On Jan. 1, 1943, the livestock resources of the state were as follows: 1,042,000 beef cattle, 123,000 milch cows, 608,000 swine, 23,000 sheep, 20,000 horses, 35,000 mules.

Manufacturing.—The more important manufactures of the state in 1943 were lumber, naval stores (turpentine and rosin) and cigars. Shipbuilding developed greatly after 1940.

The cigars manufactured in Florida are valued at around $21,000,000 annually. Tampa and Jacksonville are the leading cities in this industry. Tung oil and the production of paper pulp and the manufacture of paper and paper board are also important industries. Most of the wood pulp and of the wood pulp products now being produced in Florida are being used in the war effort.

In 1939, according to the U.S. census figures (1940), the state had 2,083 manufacturing establishments, paying $37,823,204 to 52,728 workers and producing $241,238,534 worth of goods.

Mineral Production.—Florida has only limited resources in minerals, but has large and rich deposits of phosphates, lime and limestone and less extensive, though highly valuable, deposits of kaolin and fuller's earth. The mineral products of the state in 1943 were worth about $14,000,000. (J. M. L.)

Flour and Flour Milling.

The food parley held at Hot Springs, Va. during May 1943 discussed and approved the maximum use of flour in feeding civilian populations during the war and for relief programs after the war.

The civilian consumption of wheat for 1943 by the United States was placed at 240.8 lb. per capita as compared with 224.4 lb. in 1942; 220.1 lb. in 1941; 219.1 lb. in 1940 and the 1935–39 average of 222.4 lb. The consumption of rye, oats and barley was also increased for 1943.

The increase in flour produced in 1943 was 16,834,350 bbl. and this was produced in mills having a reduced capacity as compared with the census capacity reporting in 1928, 15 years before. While the production of flour in 1942 in the United States was 108,631,604 bbl. the output for 1943 was expected to exceed 125,000,000 bbl.

Outstanding developments in the technology of the processing of wheat occurred in the industrial utilization of grains and the by-products of milling. A number of millers were grinding wheat used in the manufacture of industrial alcohol and there were good technological grounds for believing that after the war these alcohols would be derived competitively from petroleum and the grains.

Although the diversion of essential bread grains to other uses such as the production of alcohol and the diversion of wheat to animal feeding trespassed on bread reserves the supply of wheat for bread production was adequate for 1943.

The milling industry was concerned with the cost of blending in the flour as milled, thiamin, niacin, riboflavin and iron and pointed out that the cost of these materials would be 15.19 cents for 100 lb. of flour. New bread enrichment levels became effective on Oct. 1, 1943.

The new basis made numerous changes from the old enrichment levels and increased enrichment costs considerably. Beginning Oct. 1 all bread conformed to the following enrichment standard in milligrams per pound of bread:

	Minimum	Maximum
Vitamin B_1	1.1	1.6
Riboflavin	0.7	1.6
Niacin	10.0	15.0
Iron	8.0	12.5

Optional ingredients were calcium and vitamin D. The minimum standard for calcium was 300 milligrams and the maximum 800 milligrams. The minimum standard for vitamin D was 150 U.S.P. units and the maximum 750 U.S.P. units.

A major revolution in the conduct of the milling business took place when the time-honoured 196-lb. barrel was put aside as the common unit of transactions in flour. In its stead a new 100-lb. unit brought about by the War Production board's order became effective on May 1, 1943. The usual practice of packaging flour was modified by compressing it under approximately 2,000 lb. pressure. Progress was made in milling technique so that nothing but the flinty bran was removed and practically all of the vitamins present in the grain were retained in the milled flour.

Sealock and Livermore (*J. Nutrition,* 25:265 [1943]) investigated the merits of a new type of whole wheat bread. The wheat from which this bread was made was produced by the new "flotation process of Earle" and was known as "peeled wheat." It contained 98% of the original weight of the wheat kernel since only the thin epidermis or "beewing" was removed. The peeled wheat bread furnished thiamin, riboflavin and nicotinic acid in amounts equal to the upper level recommended by the Food and Nutrition board of the National Research council.

All bread and flour sold in the states of South Carolina, Louisiana and Texas had to be made from enriched flour.

Direct evidence of the value of the enrichment of flour was provided by Williams, Mason and Wilder (*J.A.M.A.,* 121:943 [1943]) Their results showed that the ingestion of a diet which provided only 0.22 mg. of thiamin for each 1,000 calories results after some months in mild thiamin deficiency, whereas the substitution of enriched white flour or whole wheat flour provided 0.45 mg. of thiamin for each 1,000 calories and in large measure prevents the development of deficiency signs and symptoms. (*See* also BREAD AND BAKERY PRODUCTS; VITAMINS.)

(H. E. Ba.)

Fluorspar.

Shipments of fluorspar in the U.S. increased from 320,669 short tons in 1941 to 360,316 tons in 1942, while consumption increased from 303,600 tons to 360,800 tons. Labour shortage cut production of metallurgical grade fluorspar toward the end of 1942, but at least five new producers were scheduled to start operation during 1943.

The normal world production is about 500,000 metric tons, of which the United States supplies one-third, Germany slightly less, with most of the remainder from U.S.S.R., France and Great Britain, but no current data were available from any of these except the United States. The normally small output of Canada was enlarged after 1939, mostly in the Madoc district of Ontario.

Food Research.

Food research in 1943 was motivated by the needs imposed by war; many findings were used immediately to serve mankind. For the first time in the United States, the food research needed by the quartermaster corps of the army and by the bureau of supplies and accounts of the navy was correlated with civilian research in one unit, the Agricultural Research administration. Unprecedented advances were made in food preservation, particularly in dehydration. Special emphasis was placed on improving the culinary and nutritive quality of dehydrated products.

Dehydrated Foods.—Methods of assessing quality in spray-dried whole eggs, now the principal dried-egg product, were evaluated by M. W. Thistle *et al.*, primarily because of the need for eggs in Britain. Moisture content, bacterial count and either fluorescence measurements or potassium chloride values seemed necessary for control purposes; the two latter tests closely checked palatability ratings. Because W. H. White and Thistle found that dried eggs deteriorated at 95° F. but changed little at 80° F., it was required that all

HOMEMADE FOOD DEHYDRATOR with electric-light bulbs for heating and electric fan at rear to circulate air. Thousands of U.S. housewives used this method of preservation for the first time in 1943

Canadian egg powders exported to England be cooled to 80° F. or lower within one hour from the time of preparation. The investigators later showed that for high quality, dried eggs should be stored at 60° F.; moisture content should be less than 2%, a limit not practical commercially in 1943. Packing in carbon dioxide had a preservative effect; compression had no effect. With moisture levels of from 0.5 to 1% and pH adjusted to 6.5, G. F. Stewart *et al.* obtained dried eggs of superior keeping qualities; storage temperatures above 68° F. were detrimental. Good-quality dehydrated eggs were obtained by H. E. Gorseline *et al.* only from good-quality fresh eggs, hygienically handled throughout dehydration. That the British organoleptic method of scoring the palatability of eggs numerically is reliable, was established statistically by G. Levin. A. H. Steffen *et al.* developed a chemical method of scoring by using the colour density of silver sulphide spots. Correlation with subjective scores was high. In home cooking, R. Jordan and M. S. Sisson made muffins with spray-dried whole egg equal in quality to those made with fresh eggs. Custards, though good, did not equal in flavour and texture those made with fresh eggs.

A dried-milk powder that had keeping qualities superior to those of whole dried milk was produced by C. D. Dahle and D. V. Josephson. Fresh milk was separated into skim milk and cream; the skim milk and the butter fat from the cream were treated to reduce lecithin content, then combined, pasteurized, homogenized and dried. Nitrogen storage improved the keeping quality. In December 1943 C. C. Van Leer gave what he believed to be the first American report on the "Niro" method of milk drying, developed in 1937 in Denmark and adopted commercially on the continent. In this method, milk is separated into cream and skim milk which are treated separately, remixed and spray-dried.

The experimental dehydration of precooked meats and unblanched vegetables was accomplished by F. M. Tiller *et al.* with infra-red radiation in the relatively short times of from 5 to 30 minutes. Dehydrated beef and pork, packed tightly in hermetically sealed, air- and moisture-resistant packages by H. R. Kraybill, did not become rancid or bacteriologically contaminated for long periods. Dried, slightly precooked meat, when cooked, was found by E. C. Bate-Smith *et al.* to be practically indistinguishable from cooked, fresh minced meat. The dried raw product on cooking had a slight "twice-cooked" flavour but was satisfactory. Compression decreased the development of rancidity during storage. Antioxidants of recognized value in delaying rancidity in fats and fatty foods were reviewed by H. S. Mitchell and H. C. Black, who found gum guaiac to be an effective antioxidant for lard, food fats, dehydrated pork and, probably, dehydrated beef.

On the basis of microscopical studies on many samples of dehydrated vegetables, R. M. Reeve reported the presence of two protective mechanisms: the solution of carotene in oils liberated by heat and the sealing of the tissues against oxidation by the drying of starch which has undergone gelation. For vegetables that contained little starch, a pectin dip was suggested; blanching was recommended for all. M. E. Davis and L. B. Howard measured some rehydration changes in vegetables quantitatively, and evaluated texture organoleptically. Rehydration was affected by size and shape of pieces, variations in drying process, conditions and time of storage, and soaking previous to cooking. The palatability of several cooked dehydrated vegetables decreased as the time of soaking previous to cooking was increased, according to F. Fenton and H. Gifft. Storage temperature had little effect on the flavour of cooked beets and rutabagas, but the flavour of cabbage, commercially dehydrated without blanching and stored for five months at 57° F. or above, was weak and unacceptable. Many varieties of cabbage scalded (blanched) in sodium sulphite solution, then dehydrated by R. J. L. Allen *et al.*, gave cooked products with good flavour and texture, and with a colour closely resembling the fresh product. Cabbage dried without scalding was unsatisfactory. Similar results with dehydrated carrots and cabbage were reported by G. Mackinney *et al.*; the sulphite dip was used after blanching. About half of 62 varieties of peaches dehydrated by J. S. Caldwell *et al.* gave excellent to good products when cooked.

Frozen Foods.—Frozen beefsteaks and pork roasts, thawed at oven temperature and then cooked, were observed by G. E. Vail *et al.* to be only slightly less tender than paired cuts thawed at room or refrigerator temperature. C. W. Du Bois and D. K. Tressler reported that the development of rancidity in frozen ground pork and beef was retarded by sage, mace and ginger, but was hastened by table salt and by holding meat unfrozen after slaughter. The development of off-odours and flavours in undrawn poultry was prevented by prompt freezing by G. F. Stewart *et al.* Prompt quick freezing of dressed birds, to be eviscerated and refrozen at a later date, offered the possibility of running an evisceration plant the year round. The skins of some peas toughened when they were held after vining and before freezing, were bruised, or were held in freezing storage for six months; thawing previous to cooking caused no toughening, according to objective tests by M. M. Boggs *et al.*

Brined Vegetables.—Unshelled and uncut green beans, lima beans and peas, brined by merely covering them with a suitable salt solution, kept nine months without spoilage when stored in open containers in unsheltered places according to J. L. Etchells and I. D. Jones. Beans of superior flavour that occupied half the space were obtained by dry-salting, compressing and storing in closed containers. Peas and green lima beans (presumably removed from the pods) could not be satisfactorily brined by F. W. Fabian and H. B. Blum because of rapid spoilage, but green beans, corn and okra brined well. The addition of some of the sugars and of vegetable acids lost during brining improved the flavour.

Canned Vegetables.—Canning peas by a specified alkalizing treatment and processing at 260° F., gave a normal canned-pea texture while elevating the pH enough to protect the green colouring considerably, according to J. S. Blair and T. B. Ayres. They believed that the lowering in pH that accompanies the conventional canning of most vegetables might be a causative factor in producing unfavourable flavour changes.

Sulphited Fruits.—Unable, because of war, to import from Holland strawberries preserved in sulphur dioxide solution, English jam manufacturers sought the fruit in Canada and the U.S. Five of 12 U.S. varieties of strawberries made into jam from sulphited fruit according to English methods were considered by C. W. Culpepper and Caldwell to be excellent or very good. Suitable concentrations of calcium carbonate insured satisfactory firmness. Frequently the long cooking needed to reduce the sulphur dioxide content to the level permitted by British food regulations caused an undesirable loss of volatile constituents. J. G. Woodroof and S. R. Cecil, studying the preservation of peaches with sulphur dioxide and the subsequent use of the fruit, obtained peach jams and preserves superior to those made from dehydrated fruit, and at least equal in palatability and colour to those made from frozen peaches.

Foods, Not Preserved.—A detailed study by F. W. Fabian and H. B. Blum as to the influence of saltiness, sourness and sweetness on one another contributed much to an understanding of food tastes. The quality of coffee was not impaired when the vapours were continuously removed for 55 days, according to a method used by A. C. Shuman and L. W. Elder. Staling appeared to be due to oxidation products that were volatile or were formed in the vapour phase. Wheat-germ oil fortified with citric acid, according to Lips and McFarlane, was an effective and practical anti-oxidant for a blend of meat-food fats and vegetable oils and for lard. The shortening value of fat used in pastry was closely related to the "worked consistency" of the fat as determined by L. R. Hornstein *et al.* The "worked consistency" was obtained by repeatedly cutting fats with fine wires; it is probably a measure of plasticity and can be measured by a penetrometer. Fats that became softest (were most plastic) during incorporation into a dough usually made the most tender pastries. The theory that unsaturation, as such, plays a deciding factor in determining shortening power might be invalidated; more research was necessary. Within limits, enrichment with steeped wheat germ or its extract improved the bread-making properties of dough, according to E. Grewe and J. A. Le Clerc. Beef roasts oven-cooked at 176° F. by S. Cover were more tender than paired roasts cooked at 257° F.; the flesh was mealy. Desirable qualities in shell eggs were stabilized by E. M. Funk who immersed whole eggs in agitated liquids at about 140° F. Treated eggs were superior to untreated ones for cooking. Pasteurization of the shell eggs reduced bacterial spoilage. Application of the process could be a means of reducing bacterial content in frozen and dried eggs. L. S. Stuart and E. H. McNally found that bacteria penetrated to the shell membrane of eggs almost instantaneously but that the membrane itself possessed limited bactericidal activity.

Objective Tests.—A specially adapted hydraulic laboratory press was developed by B. Tannor *et al.* to determine juiciness in cooked meat. A simple and inexpensive line-spread device, used by E. A. Grawemeyer and M. C. Pfund, to measure consistency in applesauces and cream fillings, gave values fully as significant as penetration and viscosity measurements. The amount of substances insoluble in 80% alcohol was found by F. A. Lee to be a measure of toughness in frozen asparagus.

Some Reviews and Books.—The recent literature on bacterial food poisoning was reviewed by C. E. Dolman. The customary annual review of the literature on fats was prepared by Piskur for 1942. Up-to-date discussions and excellent research bibliographies on experimental cookery, food preparation, freezing and dough were given in books by B. Lowe, M. D. Sweetman, D. K. Tressler and C. O. Swanson, respectively. (*See* also DIETETICS.)

Football. The navy department granted permission to its cadets in training in the colleges and universities of the U.S. to participate in varsity sports. With few exceptions, the teams were composed predominantly of such trainees in the V-12 and V-5 programs. Intercollegiate football enjoyed a full season of play that was highly prosperous for many, although there was a general falling off in attendance of 18%.

The army declined to grant such permission to its college trainees, holding that their work program was too heavy to permit them time for varsity competition. As a consequence, the great majority of the colleges with army training units abandoned intercollegiate football for the duration of the war.

Among these were Alabama, Tennessee, Florida, Mississippi, Mississippi State, Fordham, Syracuse, Georgetown, Stanford, Santa Clara, Oregon, Oregon State and Washington State. A few colleges carried on informally on a minor scale, cancelling their regular schedules.

These included Boston college, Vanderbilt and Harvard. Harvard had a navy unit but elected to play informally against service and small college elevens.

A number of colleges continued to carry on as in peacetime with civilian players under the draft age or classified as IV-F. In almost every instance they suffered defeat after defeat. They included Ohio State, ranked the top team of 1942, Pittsburgh, Nebraska, Georgia, Louisiana State and Indiana. Minnesota, annually one of the best teams in the country, and Wisconsin, one of the strongest in 1942, both had weak elevens, because their best players performed for other teams or on the fighting fronts.

It was the colleges with veteran players in the navy and marine training units that had the strong teams. Adding to the interest in the season was the fact that many of these players were transferred to other colleges and in numerous instances competed against their former alma maters. In the middle of the season some of them were shipped to other training centres, and there were instances where a player competed against the same opponent a second time after being ordered to another college. As a consequence some teams were considerably weaker in November than they were in October and others were strengthened by new-

STEVE FILIPOWICZ, fullback for the college All Stars, tackled by George Smith of the Washington Redskins in the annual collegiate-professional night game Aug. 25, 1943, at Evanston, Ill. The college team won, 27 to 7

comers in the latter half of the season.

The most celebrated player to be transferred in midseason was Angelo Bertelli. He was the master mind and hand in running the Notre Dame T formation and one of the finest passers football has known. Bertelli was sent by the marines to the boot camp at Parris Island, S.C., before Notre Dame met Army in New York. He was voted the Heisman trophy as the outstanding player of the year.

Notre Dame was rated as one of the great teams of all time since it routed some of the strongest elevens in the country. Michigan, Georgia Tech, Navy, Army and Northwestern, all powerful clubs, were numbered among its victims.

In its next to last game it barely managed to win by a point, 14–13, from the Iowa Naval Pre-Flight Seahawks. Composed of former professional and Western Conference stars, the Seahawks clearly outplayed Notre Dame in the first half but the latter showed its mettle by pulling out the victory in the second half.

In the final game, with the Great Lakes Naval Training station eleven, Notre Dame was defeated in the last 30 sec. of play by an opponent that had been beaten twice. A 46-yard touchdown pass finally defeated Frank Leahy's eleven and ruined its hopes of being the first Notre Dame team since 1930 to win every game. Great Lakes tied Notre Dame in 1942 and also during World War I in 1918.

Despite its sensational defeat, Notre Dame was still ranked No. 1 in the final country-wide poll of the Associated Press. Next in order were rated Iowa Pre-Flight, Michigan, Navy, Purdue, Great Lakes, Duke, Del Monte Pre-Flight, Northwestern and March Field. Army, which had been ranked high all season, dropped to eleventh position in the final vote after losing to Navy by 13–0, for the fifth successive year, in their first meeting at West Point since 1892.

Navy was voted the No. 1 team of the east. Duke was champion of the Southern conference, Georgia Tech of the Southeastern conference, Texas of the Southwestern conference, Tulsa of the Missouri Valley, Oklahoma of the Big Six and Colorado college of the Rocky Mountain conference.

The Pacific Coast conference title was decided by the meeting in the Rose Bowl between Southern California and Washington, representing the southern and northern divisions of the group. Southern California won by the score of 29–0 from its heavily favoured opponent.

In the Sugar Bowl, Georgia Tech played Tulsa, the former winning by 20–18. Louisiana State and Texas A. & M. met in the Orange Bowl, victory going to State, 19–14. In the Cotton Bowl, Texas and Randolph Field were matched and a 7–7 tie resulted. The East-West Shrine game also resulted in a 13–13 draw.

In addition to Bertelli, the most famous players of the year were Bob Odell of Penn, Otto Graham of Northwestern, Eddie Prokop of Georgia Tech, and Creighton Miller and Jim White of Notre Dame.

Notre Dame drew close to 500,000 spectators to its ten games. All-time records were set for the Michigan game at Ann Arbor (86,000), for the Navy game at Cleveland (82,000) and for the Northwestern game at Evanston (49,000).

Southern California and College of the Pacific drew 75,000 to their meeting at Los Angeles. Pennsylvania played to 200,000 in three games with Army, Navy and Cornell, and Army and Notre Dame drew the usual 76,000 in New York. Only 15,000 saw the Army-Navy game, restricted to residents within a ten-mile radius of West Point.

Amos Alonzo Stagg, 81-year-old coach of Pacific, was voted coach of the year by his colleagues in a national poll and was also named football's "man of the year" in a football writers' poll.

Professional Football.—With many of the players in service the National Football league continued to operate, all but one club, the Cleveland Rams, putting teams on the field. It was a highly successful season, the attendance averaging 36% per game over 1942. The quality of the football was not as good, but such stars as Sid Luckman of the Chicago Bears, Sammy Baugh of the Washington Redskins and Don Hutson of the Green Bay Packers were the usual magnets in the big cities, where money was plentiful.

The results of the games were bewildering. The Chicago Bears, with a line inferior to standard, overwhelmed the New York Giants, 56–7. The following week they were soundly thrashed by the Redskins, 21–7. Then along came the Giants to beat the Redskins, 14–10, after the latter had lost their first game of the season to the Philadelphia-Pittsburgh Steagles.

A week later the Giants, in the final game of the schedule, thrashed the Redskins decisively, and a tie for first place resulted in the Eastern division. In the play-off, the Redskins turned about and administered an even more crushing defeat to the Giants, 28–0. Baugh, Washington's great passer, ruined the day for the New Yorkers with one of his finest all-round exhibitions, completing 16 of 21 passes for 199 yards.

The Bears won the championship of the Western division. In the play-off for the league championship, the Bears avenged their earlier humiliation with a smashing 41–21 victory over the Redskins. Luckman, the Chicago quarterback, turned in a brilliant farewell performance before joining the merchant marine, setting a league play-off record with five touchdown passes. Baugh was hurt almost at the start of the game when he tackled Luckman and did not return until the second half, when he launched two passes for touchdowns.

Canada.—As in 1942, football in the dominion had a decided military tinge. All branches of the service had teams and football was introduced into the maritimes, which previously had seen only English rugger. The quality of the play was not up to peacetime standards but there was a lot of activity. The East-West play-off for the Grey cup and the Canadian championship resulted in a clear-cut, 23–14 victory for the Hamilton Flying Wildcats over the Winnipeg R.C.A.F. Bombers at Toronto. In 1942 the Bombers lost to the Toronto R.C.A.F. Hurricanes. The Wildcats had nine or ten air force men in their line-up and Winnipeg had so many airmen that the team was sponsored by the R.C.A.F. Hamilton had qualified to represent the East by defeating the Lachine R.C.A.F. team, composed entirely of men in the air force, 7 to 6.

Lachine won the championship of the Quebec Rugby Football union. Hamilton played in the Ontario Rugby Football union with two Toronto service teams, the R.C.A.F. and the Navy, and Balmy Beach, a civilian team.

In the Quebec league, both Army and Navy had teams, along with the Verdun Grads and McGill. The Western Canada league included the Regina All Services Rough Riders and the Winnipeg United Services team, besides the Winnipeg R.C.A.F. Bombers.

Possibly the best team in Canada was Halifax Navy, which easily defeated teams from Ontario and Quebec in exhibition games. Hamilton turned down Halifax's challenge.

The outstanding player was Joe Krol, Hamilton's triple-threat back, who led the Flying Wildcats to victory over the Bombers. Krol, a civilian, was offered a contract by the Detroit Lions to turn professional before the season started. (A. Da.)

Great Britain.—The Rugby union game again provided some excellent football, especially in the inter-services matches and the "service" internationals. (The players were drawn from the Rugby union and the Rugby league, but the matches were played under Rugby union rules). Wales beat England twice, at Swansea and at Gloucester. England, however, made amends by beat-

ing Scotland at Edinburgh and at Leicester. The Army and the R.A.F. met at Richmond and at Leicester, each winning once. Air Commodore G. A. Walker, who captained the R.A.F. at Richmond, very shortly afterwards met with a serious accident while on active service so that spectators saw the last of this brilliant little halfback, as a player. R. E. Prescott captained the Army and the "England" sides in all the matches. The Rugby League challenge cup was won by Dewsbury. An interesting match was played at Leeds, between Rugby union and Rugby league players attached to the Northern Command. The league side won by 18–11, the game being played under the Rugby union rules.

Five international association matches were played, three between England and Wales, and two between England and Scotland. Honours were even between England and Wales, each side winning a match and one being drawn. Against Scotland, however, England did better, drawing the first (at Wembley), but beating Scotland decisively in the second (at Glasgow) by 4–0. Blackpool won the northern cup, the Arsenal the southern cup, and the Rangers the Scottish cup. In a friendly match, Blackpool then beat the Arsenal by 4–0 at Chelsea.

Midway through the season, E. Hapgood, the veteran England and Arsenal back, retired from the game after a magnificent record. The outstanding player was once more Stanley Matthews, formerly of Stoke and in 1943 with Blackpool, and he was at his elusive best in the game at Chelsea. (D. R. G.)

Ford, Edsel Bryant (1893–1943), U.S. automobile manufacturer, was born Nov. 6 in Bagley, Mich., now the heart of downtown Detroit. The only child of Henry Ford, he studied at the Detroit university school and then entered his father's plant, at the age of 19. He completed several years of training in the shops, advancing from workman to designer, and then was made an executive in the firm. He became vice-president of the Ford Motor company in 1918, and after the Ford family bought out all the minority stockholders he was made president in 1919. He was also named treasurer in 1921. Though overshadowed by the stature of his father in the automobile field, young Ford was regarded as one of the outstanding industrial leaders in the country. He carried Ford production beyond the early Model T, introduced the Model A with conventional gearshift, streamlined the ancient Ford chassis and developed the Mercury automobile. The expansion of the Ford Motor company, which paralleled the industrial progress in the U.S. following World War I, was attributed in large part to the executive skill of the younger Ford. He died at his home in Grosse Pointe Shores, Mich., a suburb of Detroit, on May 26.

Foreign Economic Administration. In a determined step to establish more orderly methods of procedure and to put an end to bickering among officials engaged in various phases of United States economic operations with relation to foreign countries, President Roosevelt on Sept. 25, 1943, effected a consolidation of the several agencies involved by creating the Foreign Economic administration, with Leo T. Crowley as administrator. Into this new wartime authority went the Office of Economic Warfare (successor to the BEW), the Office of Lend-Lease Administration, the Office of Foreign Relief and Rehabilitation Operations, and the economic operations of the Office of Foreign Economic Coordination. Soon to follow as part of the new set-up were certain functions of the War Food administration and the Commodity Credit corporation, which were transferred to FEA by executive order of Oct. 6, 1943. The functions of these two agencies placed under the Crowley administration were those having to do with the development of food and food facilities in foreign countries.

The administrative organization of FEA was rather pretentious, including two deputy administrators with staffs of assistants, advisors and consultants. Six staff offices, headed by a general counsel and five assistant administrators, reported directly to the office of the administrator. Highly important in the organization were the bureau of areas and the bureau of supplies. These two bureaus were designed to work in closest co-operation.

The bureau of areas, consisting of Pan-American, liberated, and general and special areas, was set up to decide upon and co-ordinate programs affecting operations in all areas; to analyze foreign requirements with reference to area considerations; to supervise economic intelligence and analysis work and preclusive buying; and to oversee field work in general.

The bureau of supplies was made up of the requirements and supply branch, the foreign procurement and development branch, the transportation and storage branch, engineering service, trade relations staff, statistics and reports service and related consolidated commodity divisions. Among its duties were the analysis of foreign requirements and requisitions with reference to availability of supplies; regulation of the flow of commercial exports, and planning for transportation, warehousing and redistribution of commodities and materials.

Economic Warfare Agency.—Ante-dating by less than two-and-a-half months the sweeping reorganization of foreign economic activities of the United States under the Foreign Economic administration, the Office of Economic Warfare came into being through drastic action by President Roosevelt, precipitated by a spectacular public quarrel between Vice-President Wallace as chairman of the Board of Economic Warfare, and Secretary of Commerce Jesse H. Jones as chairman of the Reconstruction Finance corporation. The president, by executive order of July 15, 1943, abolished BEW and created in its place the Office of Economic Warfare under the direction of Leo T. Crowley, then alien property custodian and chairman of the Federal Deposit Insurance corporation. At the same time the president deprived Secretary Jones of his power over foreign financial operations and restored to Secretary of State Hull complete authority in foreign affairs.

A contributing factor in the summary action of the president was an acute dispute between field representatives of several United States agencies in North Africa that brought threats of army intervention.

Functions of the Office of Economic Warfare—carried on by BEW before it was superseded by OEW in July—constituted one of the most important phases of the war. By devious means, information was obtained regarding needs of the enemy and ways were devised to deprive him of such materials and commodities so far as possible. At the same time new sources of supply were developed for many raw materials that in normal times came from areas overrun by enemy troops.

At the close of the fiscal year 1943, the volume of development and procurement operations exceeded $1,500,000,000, a large majority of which was handled through regular commercial import channels.

The economic warfare policy was administered by three offices —imports, exports and economic warfare analysis. The office of imports directed about 100 purchase programs, involving many individual items from 40 different countries. The office of exports directed necessary controls over shipments, through a licensing system, to protect U.S. supplies of strategic materials, at the same time allowing friendly nations as much as possible. Export controls were applied to 2,500 commodities, flowing from about 16,000 export concerns to more than 140 different country designations and thousands of individual consignees, all of whom were

screened against the "blacklist" of axis suspects. The office of economic warfare analysis was of great strategic value to army and navy through providing accurate information regarding economic conditions in all countries, especially those of the enemy.

Lend-Lease Program.—Two outstanding trends in 1943 in the vast operations conducted under the Lend-Lease administration were the development of formidable reverse lend-lease and the stepping-up of shipments of food and munitions of war by the United States, especially to Russia. Both of these developments were attributable to the favourable turn of events in the Atlantic and European war areas, aided by greater productive capacity of the United States and Allied nations. Reduction of the U-boat menace in the Atlantic expedited delivery of munitions and machinery to Russia and also the transport of U.S. troops and matériel to England and North Africa. British reverse lend-lease immediately began to mount with the wide variety of goods and services provided without charge to United States forces in England and the Mediterranean area.

Upon the merging of lend-lease activities with other agencies under the Foreign Economic administration, Edward R. Stettinius, Jr., who was appointed lend-lease administrator Oct. 28, 1941, was transferred to the state department as under secretary of state.

During 1943, increasing concern was manifested by congress over the uses to which lend-lease funds were put, and appropriations were reduced below amounts requested. Up to Dec. 1, 1943, more than $60,000,000,000 had been authorized by congress for lend-lease purposes since the act was passed March 11, 1941. Of this total, $24,670,000,000 had been appropriated to the president to provide goods and services to those countries whose defense he deemed vital to the defense of the United States. The remainder—$35,970,000,000—represented authorized transfer of military goods and services procured with appropriations to the army, navy and maritime commission. Lend-lease aid had accounted for about 13.5% of total U.S. war expenditures up to Oct. 31, 1943. Goods transferred and services rendered were valued at $17,533,000,000.

Of this amount, $9,280,000,000 was credited to the first ten months in 1943. War goods transferred to the Allies during June 1943 totalled $1,030,000,000, exceeding $1,000,000,000 in one month for the first time.

In addition to the British commonwealth of nations, comprising the United Kingdom, Australia, New Zealand and India, 39 other countries were declared by President Roosevelt as eligible for lend-lease aid, up to Dec. 1, 1943. They were:

Argentina	El Salvador	Netherlands
Belgium	Ethiopia	Nicaragua
Bolivia	Fighting France	Norway
Brazil	French N. & W.Africa	Panamá
Chile	Greece	Paraguay
China	Guatemala	Peru
Colombia	Haiti	Poland
Costa Rica	Honduras	Saudi Arabia
Cuba	Iceland	Turkey
Czechoslovakia	Iran	U.S.S.R.
Dominican Republic	Iraq	Uruguay
Ecuador	Liberia	Venezuela
Egypt	Mexico	Yugoslavia

To Nov. 1, 1943, about 40% of total lend-lease shipments to the United Kingdom consisted of munitions, 26% industrial material for the fabrication of military goods, 34% foodstuffs. In contrast, the shipment of munitions to Russia comprised 56% of total lend-lease exports to that country, with foodstuffs reaching only 17% and industrial items 27%. During the year several industrial plants in the United States were dismantled and the machinery transported to Russia.

Reverse lend-lease loomed larger toward the end of 1943. As of July 1, the British reverse lend-lease totalled $1,171,000,000, and the current expenditures were estimated to be at the rate of about $1,250,000,000 a year, exclusive of supplies to U.S. forces in colonial theatres of war and important raw materials provided under reverse lend-lease.

Australia and New Zealand supplied United States troops in the Southwest Pacific with 90% of their food requirements, as well as other facilities.

Reverse lend-lease aid also was provided in the middle east, Russia, China and other countries.

Foreign Relief and Rehabilitation Operations.—In its first year the work of the Office of Foreign Relief and Rehabilitation Operations, under the direction of Herbert H. Lehman, was more one of planning than of giving relief. The organization occupied itself principally with training and building its staff, with gathering data on the needs in the various occupied countries, with making general preparations for the work ahead, and stock-piling. Fortified supplemental foods, packaged medical units and economical relief clothing were developed. In attempting to determine a basic ration, OFRRO co-operated closely with the inter-Allied committee on postwar requirements (Leith-Ross committee). There was very general agreement that an attempt should be made to provide for absolute necessities for as many people as possible and that more liberal allowances should be given as soon as production and shipping facilities permit. A bare subsistence ration of 2,000 calories a day was determined. The committee on health and medical care in the OFRRO laboured to gather and analyze available information concerning disease prevalence and important health problems in areas which might be reoccupied by Allied armed forces; to appraise the epidemic and other disease conditions which were likely to be an important part of relief and rehabilitation; and to estimate the amount and kinds of essential health and medical supplies and equipment which would have to be provided.

The principal theatre of field operations in 1943 was North Africa. There a survey revealed that milk for the children was the immediate need. Distribution of milk was begun, and some 200,000 children received slightly under a pint of milk a day. Besides this and similar work of emergency and special relief, members of the OFRRO field mission engaged in the liberation of refugees from the internment camps of Algiers and French Morocco.

In Tunisia distribution of essential supplies to distressed civilians—for the most part not gratis but by sale through the normal channels of trade—was executed close on the heels of Allied military operations.

On Sept. 25, the duties and responsibilities of OFRRO were absorbed by the Foreign Economic administration. On Nov. 9, the United Nations Relief and Rehabilitation administration was created when 44 nations united and associated in the war signed an agreement at the White House in Washington. Under this agreement and in the light of the policies established by UNRRA at its conference in Atlantic City, the organization will carry on relief and rehabilitation in the areas liberated from the enemy.

Foreign Exchange: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Foreign Investments in the United States.

The value of foreign holdings of United States stocks, bonds, cash balances and other dollar assets, excluding gold, estimated at $9,019,000,000 at the end of 1941, probably increased by $1,125,000,000 during 1942 and 1943, despite the seizure by the United States of certain enemy properties. The growth in short-term assets exceeded this increase by about the value of the

seized properties.

Among the interesting developments in this field between 1941 and 1943 was the cessation of large-scale liquidations of British investments in the United States after about the middle of 1941 when the operation of the Lend-Lease act eased Great Britain's burden of payments for future purchases. During 1943 Canadian distilleries made further purchases of leading American liquor-producing companies, and Guatemala and Haiti announced purchases of United States government bonds as part of their contribution to the war effort. The actions of the treasury department and of the office of alien property custodian concerning enemy-controlled properties were of particular interest.

The administration of controls over foreign property in the United States from 1940 to 1943 was in general focused on enemy and enemy-controlled properties and the property of neutrals whose relations to the axis were suspect. Legislation and executive orders gave the treasury department and the alien property custodian the primary responsibility for the control of these properties.

The treasury's general jurisdiction covered:

1. Dollar balances, bullion and securities of governments or nationals, except those businesses under the jurisdiction of the alien property custodian.
2. All property of the occupied and neutral countries and their nationals except those particular business enterprises where the alien property custodian determined that it was in the national interest that he assume control.
3. All transactions or business dealings with countries blocked under freezing orders including the control of trade and commercial communications with the enemy and enemy-controlled countries.

The alien property custodian, in general, had jurisdiction of the following:

1. Enemy-owned or controlled business enterprises, whether controlled directly, through neutrals, or by virtue of the occupation of invaded countries. This jurisdiction extended to the dollar balances and other assets of such businesses.
2. All other types of enemy property, except dollar balances, bullion and securities. These included estates, trusts, properties in receivership proceedings, real estate, mortgages, personal property, etc.
3. All foreign-owned patents, copyrights, trade marks and ships.
4. The interests in other business enterprises of all foreign nationals when the custodian certified to the secretary of the treasury that it was in the national interest for him to assume control.

Executive orders in 1940 and 1941 immobilized the assets in the United States of the axis and invaded countries. This served as formal notice that any attempt to secure control of the dollar assets of invaded countries or of their nationals by duress would be blocked, while the requirement that all foreign assets in the United States be registered laid the basis for effective control. Even prior to Dec. 7, 1941, control had definitely shifted from a passive measure to a valuable weapon of economic warfare.

The office of alien property custodian and the treasury strove toward the following objectives:

1. The complete severance of all financial and commercial intercourse, trade and communication, direct and indirect, between the United States and the other American republics on the one hand, and axis or axis-dominated countries on the other.
2. Control over the following potentially dangerous use of enemy property:
   a. The use of assets to finance propaganda, espionage, and sabotage in the United States, or in other United Nations countries.
   b. The acquisition of stocks of strategic materials in United Nations countries even though such materials were of no direct use to the enemy, but were diverted from the war effort of the United States.
   c. The mismanagement of plant and equipment either through failure to convert to wartime production or through less than full utilization with the specific objective of retarding maximum wartime production.
   d. The mismanagement of properties and goods by permitting them to deteriorate.
   e. Limitations on the use of important techniques and processes through the control of patents, patent applications and copyrights.
3. To promote the war effort of the United States by making available enemy-controlled productive enterprises.

The first of these objectives was aided by the treasury's procedure of licensing foreign transactions in the United States, a system of export control, and the publication of a list of persons and enterprises in Latin America and in the eastern hemisphere who were friendly to the enemy. This list, known as "The Proclaimed List of Certain Blocked Nationals," contained over 11,000 names at the end of 1942, and served the other American republics in controlling anti-United Nations activities.

Estimated Foreign Investments in the United States by Principal Countries and Areas, End of 1941
(in millions of dollars)

Country	Long term*	Short term	Total
Canada	992	375	1,367
Belgium	140	119	259
France	292	455	747
Germany	86	7	93
Italy	37	15	52
Netherlands	815	187	1,002

Rest of World	142	890	1,032
Grand Total	5,301†	3,718	9,019†

*Stocks, bonds, business enterprises, estates, trusts, real estate and mortgages.
†Includes estimated holdings of $100,000,000 of government securities not allocated geographically.
Sources: Long-term data from International Economics and Statistics Unit, Bureau of Foreign and Domestic Commerce, United States Department of Commerce; Short-term data from Bulletin of the United States Treasury Department for March 1942, as adjusted by the United States Department of Commerce.

To obtain their objectives the treasury and the alien property custodian also took control of a number of enemy properties in the United States. Both agencies were reported to have liquidated more than 500 enterprises by May 1943, and were in the process of liquidating others. It had previously been determined that these were nonessential to the war effort and that the national interest would be best served by making their productive assets and labour available to other producers. The shares of a number of concerns important to the war production were vested (the outright transfer of title to property from the foreign owner to the custodian). The custodian, where necessary, replaced the management and other personnel by loyal, competent persons. In 1943, he announced his intention to offer enemy properties at public sale. Significant proportions of vested German and Japanese assets were in chemical and insurance companies, respectively. Italian interests, except for ships, were relatively small and scattered. Rumanian, Hungarian and Bulgarian nationals had little property in the U.S.

Almost 1,800 vesting orders were issued between March 1942, and July 1943. About half of the 318 vested business enterprises were German-owned and 40% were Japanese. Of the 72,000 copyrights vested in 63 orders, 70,000 were almost equally divided between French and Italian music publishers. German-owned copyrights, although concentrated in scientific and technical works, were a relatively small part of the total. More than 41,000 patents and patent applications were vested; over 25,000 of these were German-owned. About three-fourths of the 861 orders vesting estates and trusts pertained to German interests. The proceeds of properties sold and liquidated by the custodian and royalties collected on patents and copyrights were being held by him pending ultimate congressional disposition of enemy property in the United States. Foreign Trade: *see* INTERNATIONAL TRADE.

Forests. Early in 1943 Lyle F. Watts was appointed chief of the forest service, United States department of agriculture, succeeding Earle H. Clapp, who had been acting chief after the death of Ferdinand Silcox in 1939. In transmitting his first annual report to the secretary of agriculture, Mr. Watts said, "There is reason for concern that wartime demands

have unnecessarily accentuated forest problems urgently in need of solution before the war." Pointing out "that we cannot continue indefinitely to cut more than we grow," Mr. Watts urged public regulation of forest practices on privately owned lands. He declared that nationwide action on such a vital issue could not be effective if left to the states with no more than financial aid from the federal government. He suggested comprehensive federal legislation in which regulation of forest practices would be "supported by an expanded and accelerated program of public acquisition of forest lands to relieve private ownership of responsibility where conditions make this equitable or prudent," and would be "supplemented by better protection and by various aids to private owners."

Public regulation of forest practices was considered by the legislatures in 15 states during 1943. California, Maryland and Minnesota adopted regulatory laws. Seven other states had previously enacted such legislation, although only Oregon and Virginia had attempted enforcement. The Eastern States Conservation conference sponsored by the Council of State Governments approved a model bill for forest regulation by the states after a year's study of the problem.

Maintaining the output of lumber and other forest products continued to present a major wartime problem. No sooner was wood called upon to replace critical metals in many fields than wood itself became a critical material. In spite of all efforts to stimulate output, lumber cut during 1942, amounting to some 36,400,000,000 bd.ft., fell some 6,000,000,000 bd.ft. short of consumption.

With stocks on hand at a critical low and dwindling rapidly, the War Production board called upon the forest service to utilize its field organization to facilitate the output of lumber and pulpwood in the eastern states. Although the shortage of manpower was fully recognized, there was need for special service, particularly to small operators, in meeting the many inevitable procedures incident to war, in providing technical guidance for forest cutting practices and in obtaining a log supply for mills not adequately provided with standing timber.

Production from farm woodlands for war needs was also stimulated by the assignment of 76 foresters by the forest service in co-operation with the states to marketing projects involving 285 counties in the eastern states under the Norris-Doxey Farm Forestry act.

The national forests contributed to national needs as never before. The cut of timber from the national forests in the fiscal year ending June 30, 1943, again established an all-time high of 2,359,473,000 bd.ft. Of special importance was the program for obtaining Sitka spruce from the national forests of Alaska. Working under the most difficult winter conditions, contractors engaged by the forest service delivered the first raft of logs to Puget sound in Jan. 1943. The yield of aircraft quality lumber from the Alaskan logs exceeded all expectations. During the summer logs were arriving at a rate of 5,000,000 bd.ft. a month.

Forest service research furnished a partial solution to the problem of labour shortage in the production of turpentine and rosin. Chemical treatments applied in the woods make it possible to double the interval between successive chippings without reducing the yield of gum. Looking to the future, substantial progress was made in selecting and propagating strains of pine giving unusually high yields of gum. Individual trees yielding between two and three times as much gum as their associates of the same size and vigour were segregated.

Indicative of the potential disruption and damage to war industries and transportation which forest fires may cause, as well as of the importance of wood in the war, is the record of two

WYOMING'S most disastrous forest fire, set by lightning on July 31, 1943, in the Big Horn national forest, destroyed thousands of acres of timberland. Soldiers joined with forest rangers and civilians in attempting to control the spread of the flames

incendiary bombings by Japanese which occurred in the forests of western Oregon. Fortunately neither resulted in a serious outbreak.

Because of the importance of more intensive forest fire protection in wartime, congress again supplemented regular appropriations with emergency funds. The $12,212,000 made available in the fiscal year ending June 30, 1943, served to protect the zones of greatest danger, but left unprotected, as in previous years, about a third of the entire area needing organized protection, mostly in the south. And fires in the south were particularly widespread during the spring of 1943.

The fire protective agencies were handicapped by loss of experienced men to military service and war industries. Liquidation of the Civilian Conservation corps was offset in a limited way by the availability of some 2,000 conscientious objectors assigned to the forest service for work of national importance under civilian direction. Sixty of these men volunteered as "smoke-jumpers" in the Pacific northwest and northern Rocky Mountain regions, thus permitting an expansion of the use of parachutes to drop men and supplies from aeroplanes for prompt attack on fires in remote and inaccessible areas.

When the Japanese invasion of the Netherlands Indies and shipping difficulties cut off the supply of imported rubber, the United States undertook the development of native sources as well as the manufacture of synthetic rubber. For many years natural rubber was produced commercially but in limited volume from guayule, a desert plant native to parts of northern Mexico and southern Texas. Production in the United States was limited to one concern with several hundred acres of plantations and a small extraction plant in California. Expansion of plantations and other facilities for the production of guayule rubber was assigned to the forest service.

By June 30, 1943, 23,470 ac. had been planted with guayule. Seven nurseries, aggregating over 3,400 ac., were established in California, Arizona, New Mexico and Texas. Sufficient stock was available in these nurseries for the additional planting requested by the rubber director for the 1943–44 season. From mature cultivated shrub 440 tons of high quality rubber were extracted.

A pilot plant was erected to gain experience with a process extensively used in Germany for the production of ethyl alcohol or high protein livestock feed from wood waste or low quality timber. By this process sawmill waste was successfully used for the manufacture of synthetic rubber. (C. E. B.)

British Empire.—For yet another year the main effort on the part of empire foresters was in the supply of timber and other forest products required either for munitions of war or to replace timber previously imported from other countries. There was also an increased concentration of thought on postwar planning. The British Forestry commission produced an important note on postwar forest policy, the main aim of which would be to ensure at least 5,000,000 ac. of effective woodland which would be secured from 2,000,000 ac. of existing woodlands and 3,000,000 ac. to be obtained from afforestation of bare lands. The note also proposed the dedication of existing private woodlands in return for state assistance. At the close of the year discussion was continuing. The Canadian Society of Forest Engineers issued a statement of the forest policy they considered suitable for Canada. Proposals for largely increasing the area to be planted by the state in the Union of South Africa were also put forward. Other forest departments of the empire were engaged in postwar planning, often in collaboration with other authorities such as agricultural and veterinary departments.

It was being realized that the many new uses for timber introduced during the war, as well as the improved methods of using timber and its main bases, cellulose and lignin, must result to some extent in a change in the chief objects of forest management. The old demand for large sizes of lumber was to a great extent replaced by a demand for veneers and the building up of laminated wood structures. It seemed possible, therefore, that forests would have to be managed to produce the maximum quantity of wood rather than the smaller quantity of superfine large timber. (*See* also LUMBER.) (H. R. BD.)

Formosa (TAIWAN), Japanese colony, ceded to Japan by China after the war of 1894–95, a large island in the western Pacific, separated from China to the west by the Taiwan straits and from the Philippines to the south by the Bashi and Balintang channels. The Pescadores (Bōkotō) and other outlying islands form a political division of the Taiwan government-general. Area 13,429 sq.mi.; pop. (1938) 5,746,959, of whom 308,845 were Japanese and about 150,000 aboriginal tribesmen in the mountainous interior. The majority of the Formosans are of Chinese stock, and restitution of the island to China was one of the decisions of the Cairo conference of President Roosevelt, Prime Minister Churchill and Generalissimo Chiang Kai-shek in the last days of Nov. 1943. Capital, Taihoku. Governor-general in 1943, Admiral Kiyoshi Hasegawa. There is a large naval base at Mako, in the Pescadores.

Education, Trade, Agriculture, Mining, Industries.—In 1937 there were 143 primary schools, with 1,108 teachers and 43,671 pupils, for the Japanese, and 788 schools, with 7,242 teachers and 445,396 pupils, for the natives. The unit of currency is the Japanese yen, valued at 23.48 U.S. cents before the outbreak of war in the Pacific. The Formosan budget was 183,014,971 yen in 1938–39, 260,530,226 yen in 1939–40. Overseas trade, overwhelmingly with Japan and its territories, amounted to 592,938,000 yen (exports) and 408,650,000 yen (imports) in 1939. Formosa is one of the world's largest producers of camphor, and there is a government monopoly of this product, and also of salt, opium and tobacco. The soil and climate of Formosa have proved favourable to the cultivation of sugar, and there was a sharp increase in the output of sugar to 2,364,550,976 *kin* in 1939, as compared with 1,650,266,812 *kin* in 1938. (The *kin* is about one and one-third U.S. pounds). The output of rice increased from about 330,000 tons in 1899 to about 1,600,000 tons in 1938. More than half the annual rice crop is exported to Japan. The island contains limited deposits of gold and iron and is a producer of tea and jute. There were 646 mi. of government and 317 mi. of privately owned railways in Formosa in 1937, besides 1,246 mi. of railways designed for the use of private firms, mostly sugar companies. There were 217 telegraph offices in the island, with 734 mi. of line. There were 2,946 mi. of telephone lines. There were 633,053 savings bank depositors in the island in 1937, and deposits in savings banks amounted to 27,136,748 yen. (W. H. CH.)

Foundations: *see* DONATIONS AND BEQUESTS and foundations under their specific names.

Four-H Clubs. Approximately 1,690,000 rural girls and boys between the ages of 10 and 21 enrolled as 4-H club members in 1943.

The 4-H members produced about 5,000,000 bushels of garden products during the year; produced and cared for 9,000,000 chickens and other poultry; cared for and managed 90,000 head of dairy cattle and 600,000 head of other livestock; grew 12,000,000 pounds of soybeans, peanuts and other legumes; and canned 15,000,000 jars of vegetables, fruits and meats. They collected more than 300,000,000 pounds of metal scrap and purchased or sold to others over $25,000,000 worth of war bonds and stamps. Some 800,000 members helped to safeguard their own health and that of their families and communities by having periodic health examinations, checking food and health habits, taking first aid and home nursing courses, and removing farm and home accident hazards. There was a marked increase in the number of 4-H members who helped care for and repair farm and home equipment, who repaired and remade their own and frequently their families' clothing, who helped provide farm fuel supplies, and participated in fire prevention activities. In addition, 4-H members worked many hours on home and neighbouring farms to help relieve the shortage in farm labour.

Because of wartime conditions only one national 4-H event was held in 1943, the 22nd annual National 4-H Club congress. This was held in Chicago, Ill., Nov. 28 to Dec. 1, with an attendance of approximately 800 rural girls and boys accompanied by their state 4-H leaders. Forty-six states and two provinces of Canada were represented. A national 4-H Mobilization week was observed Feb. 6-13 and a national 4-H Achievement week Nov. 6–13.

The 4-H clubs are conducted by county agricultural and home economics extension agents co-operatively employed by the U.S. department of agriculture, the state land-grant colleges, and the counties in which they work. There is a supervisory staff located at the state land-grant colleges and the U.S. department of agriculture. Assisting the county agents in conducting the 4-H clubs are volunteer local leaders (157,726 in 1943). In 1943 there were about 93,000 clubs representing practically every county in the 48 states and Alaska, Hawaii and Puerto Rico. (M. L. W.)

France. An occupied state situated in the west of Europe; bordered N. by Belgium and Luxembourg, N.E. by Germany, E. by Germany and Switzerland, S.E. by Italy, S. by Spain, with the Mediterranean sea on its southeast coast, the Atlantic ocean on the west, and the English channel and the North sea to the north. Area, 212,736 sq.mi.; pop. census (1936) 41,907,056; estimate (April 1, 1941) 39,302,511, exclusive of war prisoners; provisional capital, Vichy; chief of state in 1943 (since 1940): Marshal Henri Philippe Pétain. By the armistice

JOYOUS FRENCHMEN turned out in droves to welcome the British 1st army as it entered Tunis May 7, 1943

of June 22, 1940, France was divided into two zones: the occupied and the unoccupied (*c.* 85,000 sq.mi.). Although the Germans in Nov. 1942 occupied the whole of France (save portions of Savoy and the Riviera occupied by the Italians) the line of demarcation was maintained until March 1, 1943, when it was abolished, and postal communication and unlimited travel between the two zones was restored except for Jews. After the Italians surrendered to the Allies on Sept. 3, 1943, the portions of French territory occupied by them were taken over by the Germans.

Language: French; religion: Roman Catholic; *c.* 1,000,000 Protestants.

History.—The history of France in 1943 must be studied under two different heads—that of totally occupied metropolitan France and that of the gradually-liberated French colonies and protectorates.

Occupied France.—The year 1943 was one of hardship for metropolitan France. On Jan. 4, 1943, as a reply to the North African campaign of the Allies, the Germans created a closed military zone along the French Mediterranean coast, from Menton to the Pyrénées, and rushed fortifications in order to ward off a possible Allied attack. By the end of March, having decided to expand these fortifications along the whole South European coast, they demanded 100,000 French workers to help construct a "Mediterranean wall."

In all, German demands for French workers during the year amounted to over 1,000,000 men: on February 21, they asked for 250,000 workers to supplement 130,000 already there, promising to release only 50,000 war prisoners in exchange; on April 12, Vichy announced that "250,000 French prisoners would become 'free labourers' in German war plants on 'captivity furlough'," and on April 15, Madrid reported that Pierre Laval, Pétain's chief of government, had turned over to the German Labour corps all of the 1,250,000 French war prisoners. Still, in May, 400,000 more workers were sent to Germany by Laval, and on June 5, he broadcast from Paris the order to mobilize the 1942 military class for work in Germany, whereby 200,000 were to go without delay. Fearing a possible vengeance of French patriots, Laval on Jan. 30, organized a "French militia," dressed in brown shirts, as his own elite guard. The French chief of government seemed to have foreseen that he would need protection, as once again there was an attempt on his life; while he and his finance secretary, Pierre Cathala, were returning from a conference with Adolf Hitler (April 29) they were wounded by a time bomb, although Vichy officially denied the attack. There were also two more assaults on the life of the notorious collaborationist, Marcel Déat. For the first attempt in Tours, seven patriots were executed by the Germans on Jan. 13; the second took place near Paris, on March 10, but Déat escaped unharmed.

On the whole, 1943 was the most fertile year yet in sabotage, assaults on the occupying authorities as well as on French Quislings, and in open revolts. On March 7, 200 persons were arrested for blocking trains transporting conscripted workers from Marseilles and Lyon. On March 8, 23 nazis were killed in Lille, and on March 10, 12 were assassinated in Lyon. The same day, a munition train was blown up between Valence and Vienne. On March 13, Swiss dispatches stated that French guerrillas (mostly fugitive conscripted workers) under the command of General Cartier and supplied with arms by Allied planes, were battling Italians in the Haute-Savoie. However, on March 17, aided by French police forces, the Germans blockaded the fighters and put a momentary end to the revolt. After a short pause, riots again took place in various French towns, and on May 18, martial law was declared in Clermont-Ferrand. The Swiss press stated that 150 persons, including many government officials, were arrested for plotting against Laval, when in his effort to collaborate at any price, he agreed to send 400,000 more French workers to Germany. The underground's answer was the assassination in Marseilles of Jean Bouisson, propaganda chief of Pierre Laval's militia (May 30). On June 27, the Berlin radio announced that Fritz Schmidt, nazi party chief in Holland, engaged in conscripting workers, "met with a fatal accident during a tour of France." In August, street fights broke out in Paris and its suburbs, and throughout the country patriots revolted and killed nazis, German casualties amounting to thousands of men.

While Laval forced France into a still closer collaboration with

Germany and, besides his "labour levy," applied drastic measures against the Jews (he denaturalized 100,000 Jews and authorized that several thousands be taken as hostages, shot or deported to the east), Pétain tried to maintain the Vichy regime by pursuing the policy of his much publicized "national revolution." On May day, 1943, he asserted that France was "on the right road" to revival, and asked the people to "smash the lies which aim at seducing you." However, the Vichy home intrigues developed into a new crisis, when suddenly, on Nov. 18, Pétain's resignation was reported by Berne. He was said to have resigned because he was not permitted to make a broadcast on Nov. 13, convoking the chamber of deputies to choose his successor and establish a parliamentary government; but soon the crisis seemed to dissolve, and little news leaked out about the incident. The Swiss press explained that all had been staged by the old marshal himself in an attempt to prevent Laval from succeeding him after his death.

During the fourth year of occupation, the population of France saw itself deprived of most of the natural resources and manufactured goods. The breadlines became each day longer; on February 27, the people were faced with the necessity of living one whole month of 1943 without bread.

The tragic situation of the French people was further aggravated during 1943 by the intensive air raids of the Allied air forces. Frequent, devastating attacks were carried out over the French channel ports (especially towards the end of the year, when the Germans installed rocket guns there), industrial centres, railroad junctions, airfields, power stations, etc. Towns like Lille, Abbeville, Le Havre, Brest, Lorient, St. Nazaire, Le Creusot, Lyon, Marseilles, as well as the industrial suburbs of Paris, were systematically blasted from the sky; Renault, Citroën, Potez and other plants which were doing high-speed work for the German war industry, if not entirely put out of production, were at least extremely damaged, and their production power was considerably diminished.

Underground Movement.—The efforts of the underground movement in 1943 were particularly concentrated on: (1) preventing the French workers from going to Germany; (2) forming of organized resistance to the Germans, and (3) helping political prisoners escape to England and Africa. The French clandestine press served actively those purposes. In the summer of 1940, there were only three underground newspapers; by the summer of 1943, the number had increased to 70, with a total circulation of 800,000 a month, the chief publications being: *Combat, Libération, Défense de la France, La France, L'Humanité, La Vie Ouvrière, Résistance, Cahier français du témoignage chrétien, Le Populaire, Franc Tireur.*

Fearing the interference of the underground, the Germans transferred their most valuable prisoners to Germany, and, on April 4, it was announced that the former French political leaders, Léon Blum, Edouard Daladier, Paul Reynaud and Georges Mandel, and General Maurice Gamelin, were interned somewhere in Germany.

Finance.—The 1943 French budget, as reported in Switzerland, listed for the year expenditures of 128,000,000,000 francs (about $2,560,000,000) and revenues of 102,000,000,000 francs (about $2,040,000,000). It did not mention the government's debt of 201,000,000,000 francs to the Bank of France to meet German occupation costs, which in 1943 amounted to 300,000,000 francs a day, while 125,000,000 francs would have been sufficient to cover the expenses. On the black bourse of neutral countries, the value of the franc varied from 250 to 350 to the dollar, while the official rate remained 43.50. So far, World War II had cost France $10,100,000,000, according to an estimate of the department of commerce, Washington, Feb. 5, 1943.

Liberated France.—Meanwhile, in North Africa, the military operations of the Allies progressed steadily—operations in which French troops took a prominent part (*see* WORLD WAR II).

The political situation in North Africa, complicated by the assassination of Admiral Jean Darlan on Christmas eve, 1942, suffered several serious crises in 1943. The disagreement between Generals Charles de Gaulle and Henri Honoré Giraud increased when a spokesman of de Gaulle, broadcasting from London, on Jan. 1, 1943, demanded that the "Vichy-packed" French Imperial council in Algiers be eliminated, before de Gaulle would join with Giraud. De Gaulle's forces were further irked by the report that Marcel Peyrouton, former Vichy minister of the interior and ambassador to Argentina, had been appointed governor general of Algeria Jan. 19, 1943.

At the end of the historic meeting of Casablanca (Jan. 10–24, 1943) between President Roosevelt, Prime Minister Winston Churchill, de Gaulle and Giraud, the latter two announced: "We have met. We have talked. We have registered our entire agreement on the end to be achieved, which is the liberation of France and the triumph of human liberties by the total defeat of the enemy. This end will be attained by a union in war of all Frenchmen fighting side by side with all their Allies." It must be pointed out, however, that the understanding at Casablanca was of a purely military nature; the political situation continued as before. On Feb. 9, Peyrouton created a Permanent Council of War Economy, of 39 members, headed by Gen. Jean M. J. Bergeret, former Vichy air minister, and a few days later, he appointed Antoine Gardel, former aide to General Maxime Weygand, director of Press and Information services. At the same time, de Gaulle, demanding the restoration of the laws of the republic, told a press conference in London that if freedom of the press, individual liberty and the right to peaceful assembly were restored in French North Africa, the differences between him and the regime of Gen. Giraud would soon disappear. On Feb. 8, Gen. Georges Catroux, Fighting French delegate and commander in chief in Syria, arrived in Algiers to represent General de Gaulle in conferences with General Giraud. From that time on General Catroux was the constant mediator between the two generals.

Negotiations leading to the formation of the French Committee of National Liberation were made public on April 19, 1943, by the French military mission in Washington. At first, Gen. Giraud proposed to Gen. de Gaulle the creation of a "French Council of Overseas Territories," which would exercise French sovereignty until the creation of a provisional government. In his answer to this proposal, made public in Washington on April 21, Gen. de Gaulle urged representation of the French underground movement, curbing of the military commander's authority and removal of Vichyites from important posts in North Africa. On April 27, Gen. Giraud offered through Gen. Catroux to meet de Gaulle, but, almost simultaneously he accepted the services of Vice Admiral Emile Henri Muselier, former naval chief to Gen. de Gaulle, who had been dismissed by the latter. On May 10, however, Gen. Giraud made again unity proposals to Gen. de Gaulle, who finally accepted the principle of a seven-man council and announced on May 24, 1943, that he would soon leave for Algiers with René Massigli, foreign affairs commissioner and André Philip, interior commissioner; Gen. Catroux was to precede them.

French Committee of National Liberation.—Generals de Gaulle and Giraud met in Algiers on May 30, 1943, and on the following day the French Committee of National Liberation was formed as follows: the two generals became co-presidents; the Giraud appointees were Jean Monnet and Gen. Alphonse-Joseph Georges, who had just escaped from France; the de Gaulle appointees were Gen. Catroux, René Massigli and André Philip, who was elected by the other six. On June 7, the French Committee of National

Liberation appointed a cabinet of 14 and subsequently it was recognized by 25 countries. The United States, Great Britain, Canada and the U.S.S.R. recognized it on Aug. 26. As an immediate consequence to the committee's creation, there were several resignations of high officials, as for instance those of Marcel Peyrouton and Gen. Charles Noguès, resident general of Morocco, who was replaced by Gabriel Puaux, on June 7. But, far from being satisfied by this state of affairs, Gen. de Gaulle, on June 11, threatened to resign from the Committee of Liberation unless it would agree to the elimination of Vichyite officers from the army. He also opposed Gen. Giraud as national defense minister while still army commander and urged the dismissal of Pierre Boisson, Vichyite French West Africa governor general and the elimination of Vice Admiral Muselier. A new compromise was reached, however, on June 22, under which Gen. Giraud was to retain command of the French armies in Morocco, Algeria, Tunisia and French West Africa, while Gen. de Gaulle was to continue as commander of all forces in the rest of the empire. An eight-man committee, including the two generals, was set up to reorganize the French army. In the summer of 1943, following an invitation issued a long time before by President Roosevelt, Gen. Giraud visited the United States. He arrived in Washington on July 7, and conferred with Roosevelt and his military leaders, about the rearmament of 300,000 French soldiers with U.S. equipment.

After a trip to Canada, Giraud returned to Algiers via London where he saw Prime Minister Winston Churchill. Upon his arrival in Algiers on July 22, he was faced with a new crisis, and on July 31, the Committee of Liberation proceeded to an important reorganization by a new distribution of roles. Gen. de Gaulle was named head of a newly formed National Defense committee which made him civil leader; Gen. Giraud was named military commander subject to committee decisions. Information Commissioner Henri Bonnet declared that complete unity had been achieved. On Aug. 12, a Commission of Purification was set up in Algiers by the Committee of Liberation to eliminate advocates of collaboration from public posts. These measures met with the approval of the French Council of Resistance (union of underground groups in occupied France) who, on July 25, had asked the Liberation committee "to finish once and for all with the survivals of Vichy," and to "remain faithful to General de Gaulle." The Commission of Purification proceeded to arrest leading collaborationists, accused of treason by the Committee of Liberation, including Pierre Pucheu, former Vichy minister of interior; Gen. Jean Bergeret; former Premier Pierre-Etienne Flandin; Marcel Peyrouton; Pierre Tixier-Vignancourt, former Vichy secretary of information; Pierre Boisson, former governor general of French West Africa; former deputy André Albert; former director of the state bank in Casablanca, Desoubry and numerous other well-known personalities. On the other hand, the question of the political prisoners interned in North Africa by the Vichy regime, was finally solved; on Oct. 14, Algiers announced that 7,100 men and women had been freed. On Oct. 21 the Crémieux decree (*see* ANTI-SEMITISM) was reinstated in Algeria, and towards the end of 1943 the Committee of Liberation decided to grant "full citizenship rights" to French Moslems there and to increase their proportion in political offices.

On Sept. 25, 1943, the United States signed a lend-lease agreement with the Committee of Liberation, formalizing an aid program in effect since the Casablanca conference. On Oct. 19, Algiers reported that Gen. de Gaulle had conferred with British Foreign Minister Anthony Eden and U.S. Secretary of State Cordell Hull, when they stopped in Africa on their way to Moscow, and that "substantial unanimity" on future programs had been reached. There was a certain discontent at Algiers, as France had not been invited to the Moscow and Tehran conferences.

On Nov. 3, a Provisional Consultative assembly composed of 84 members, including numerous former deputies and delegates of the resistance, met in Algiers and functioned as a kind of an advisory body without legislative power. Gen. de Gaulle described it as the "voice of the nation rising from the dungeon." On Nov. 25, it was announced by the Committee of Liberation that the membership of the assembly would be raised to 102 to include 18 more members of the underground. On account of certain disagreements, Gen. Giraud and four of his supporters resigned on Nov. 9 from the Committee of Liberation, but he remained head of the French army. And on Nov. 30, Commissioner of Justice François de Menthon declared that Gen. Charles de Gaulle and all members of the French Committee of National Liberation would resign "to the president of a provisionally elected French assembly after liberation." (*See* also FRENCH COLONIAL EMPIRE; INTERNATIONAL LAW; WORLD WAR II.)

Franco, Francisco (1892–), Spanish soldier and statesman, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic Islands, being later transferred to Morocco again. In 1935, he was made chief of staff. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, and there organized the transport of Foreign Legionaries and Moorish troops to the Spanish mainland, whither he soon followed. Upon the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents. After his victorious conclusion of the civil war in 1939 he added the title of prime minister to the others he possessed, organized his cabinet, and began the task of reconstruction. Franco issued a declaration of "strictest neutrality" in Sept. 1939.

Franco's position in 1942–43 was unenviable. Successive Allied victories led him to water down his pro-axis sentiments and hew closely to the line of neutrality. He tried the role of peacemaker on May 10, 1943, urging both the Allies and axis powers to cease fighting because, he asserted, a deadlock had been reached. His appeal was ignored by the Allies, since it was presumed that Germany was using him as a mouthpiece to sound out Allied sentiments regarding a negotiated peace. Within Spain, opposition to his rule grew during 1943, with the monarchists purportedly seeking to oust him from power; on July 18, he warned the monarchists that he would not tolerate continued plotting for his overthrow. (*See* also SPAIN.)

Fredendall, Lloyd R. (1883–), U.S. army officer, was born Dec. 28 in Wyoming. A cadet at the U.S. Military academy, 1901–02 and 1902–03, he was commissioned a second lieutenant of infantry in 1907. He graduated from the Army Signal school in 1914, took a field officers' course in 1922, graduated from the Command and General Staff school with honours in 1923, and completed studies at the Army War college in 1925. During World War I, he served as General Pershing's staff assistant. From his post as chief of an army corps at Chicago, he went into active duty in 1942. He commanded the U.S. army corps in North Africa until he was replaced by General George Patton during the Tunisian campaign. On his return to the United States he was made commander of the second army at Memphis, Tenn., replacing Gen. Ben Lear, who was retiring. On May 27, 1943, Fredendall was promoted to the rank of lieutenant general.

Free France (Fighting France): *see* FRANCE; FRENCH COLONIAL EMPIRE.

Freeman, James Edward (1866–1943), U.S. clergyman, was born July 24 in New York city. After finishing his public school education, he worked for 15 years in the legal and accounting departments of the Long Island and New York Central railroads. He was well on the way to a successful business career when Bishop Henry C. Potter induced him to study for the ministry. He was ordained as Episcopal deacon in 1894. During the years that followed he built large congregations in Yonkers, Minneapolis and Washington and founded numerous community centres. He went to Washington as rector of the Church of the Epiphany in 1921 and was elected the third Protestant Episcopal bishop of Washington in 1923. Soon after he became bishop he revived a 40-year-old plan to construct the National cathedral in Washington, a national shrine similar to Westminster abbey. He raised enough funds to get construction under way and open the partially completed structure for worship in 1932. He died in Washington, June 6.

Freeman, Richard Austin (1862–1943), British author, first served in the Gold Coast colony as assistant colonial surgeon. At the turn of the century he became acting deputy medical officer at the Holloway prison and in 1904 acting assistant medical officer of the Port of London. His wide medical background gave credence to the exploits of his chief mystery story hero, detective-pathologist Dr. Thorndyke. His works include: *The Red Thumb Mark* (1907), *The Eye of Osiris* (1911), *The Singing Bone* (1912), *The Cat's Eye* (1923), *The Stoneware Monkey* (1938), *Dr. Thorndyke's Crime File* (1941), an omnibus of Dr. Thorndyke stories, and *The Jacob Street Mystery* (1942). Dr. Freeman died at Gravesend, England, Sept. 30.

Freer Gallery of Art: *see* SMITHSONIAN INSTITUTION.

French Colonial Empire. Total area (excluding Syria and Lebanon) (approx.) 4,579,000 sq.mi.; total pop. (est. Dec. 1939) 67,591,000. Certain essential information on the French colonies, protectorates and mandates is given in the table.

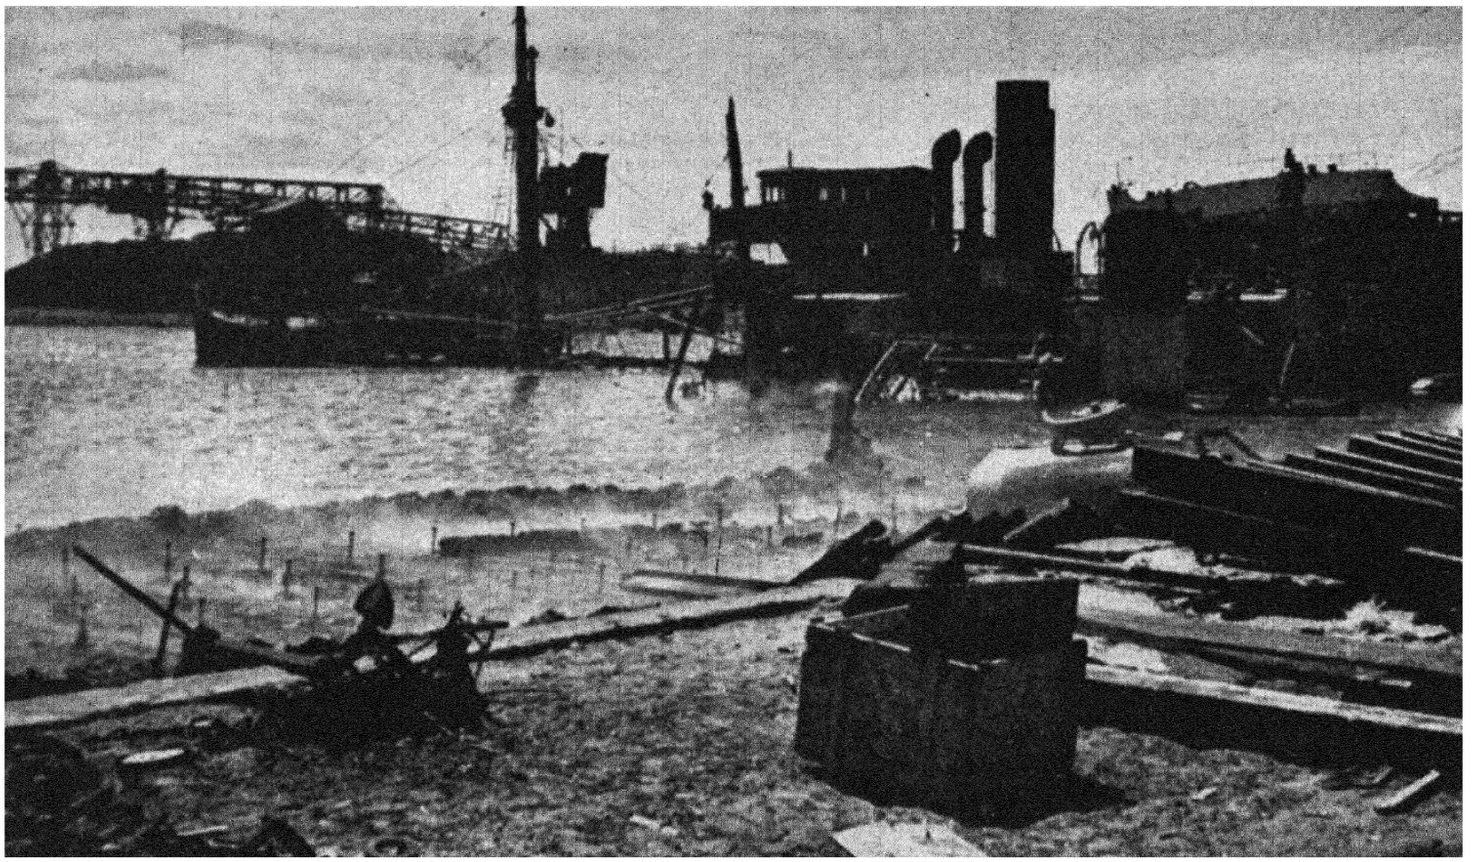
The year 1943 saw the extension of the authority of the French Committee for National Liberation over all French colonial possessions, with the exception of Indo-China which remained under Japanese control.

French North Africa.—Relief measures, following on military operations, necessitated the establishment of an Anglo-American North African economic board to supervise the supply of civilian goods and restore normal economic conditions. By May 31, 170,000 tons of lend-lease goods had been received and, in exchange, 50,000 tons of raw materials were exported to the United Kingdom and the United States, including manganese, cobalt ore, cork, tanbark, red squill, iron ore and phosphate rock. In March, a rationing system for clothes was announced. On May 18, the Vichy press laws were abrogated. An order of Feb. 17 allowed Jews to enlist in combatant units and in March it was reported that the Jewish Affairs bureau had been liquidated. An economic high council was set up on Feb. 5 on which each country of French Africa was represented. The exchange rate was changed from 75 francs to the dollar and 300 francs to the £ to 50 francs to the dollar and 200 francs to the £. Transfer of funds between territories under the control of Generals de Gaulle and Giraud was allowed in May.

Algeria.—Marcel Peyrouton, who was appointed governor-general in January, ordered the reinstatement of municipal officers who were in office on June 22, 1940, and the return of public officials and members of the administration dismissed by Vichy laws. The Délégations Financières and Conseil Supérieur were reestablished in February and a Conseil Permanent de l'Economie de Guerre was created the same month. In April municipal councils were reinstated.

On June 3 General Georges Catroux was nominated governor-general in place of Peyrouton who resigned.

In the autumn M. Walet, attorney-general at the court of appeal, was dismissed on the recommendation of the "Purge Commission."



General de Gaulle announced on Dec. 12 that French citizenship

RAVAGED PORT OF TUNIS after its capture by Allied forces May 7, 1943

was to be accorded to Moslem élite in Algeria; the proportion of Moslems in local assemblies was to be increased and more administrative posts were to be opened to them.

Tunisia.—Approximately 8,000 refugees were given clothes and employment; markets in essential commodities reopened under Allied supervision; food was imported at the rate of 140 tons daily and the whole railway network was restored by the end of May. The Sultan Mohammed el Moncef was deposed in May and succeeded by Sidi Alim Pasha who resigned in July.

General Charles Mast was appointed resident-general on May 7 and took up his duties on June 25, General Alphonse Juin holding temporary office until his arrival. M. Joppe, attorney-general, was suspended and replaced by M. Verin.

French Morocco.—Gabriel Puaux was nominated resident-general on June 3 to replace General Charles Noguès, M. Meyrier acting as resident-general until Puaux's arrival on June 21.

By September no high official retained the post he held at the time of Puaux's appointment. Under Noguès the municipal councils were reinstated in April and Colonel Maurice Herviot was replaced by Colonel Ferdinand Taillardat as director of public security in the Morocco provisional government.

French West Africa.—Pierre Boisson's resignation as governor was announced on June 29. French reservists demobilized in 1940 were ordered to return to their units by Jan. 15. The appointment of Admiral William A. Glassford, Jr., head of the U.S. mission to Dakar, as President Roosevelt's personal representative in French West Africa was announced on May 28.

Elected municipal councils were restored in March. An economic council was set up which reported a decrease in the production of ground-nuts and the export to the Allies of oil seeds, rubber and mahogany.

French Equatorial Africa.—General de Gaulle and René Pleven arrived in Brazzaville on Aug. 28 on a visit.

French Somaliland.—Jibuti adhered to General de Gaulle on Dec. 28, 1942.

Madagascar and Réunion.—General Paul Louis Legentilhomme, high commissioner, landed on Jan. 7. The British were continuing improvements at Diego Suarez on the basis of French prewar plans, and the British government had paid £10,000 in compensation to civilians for damage done by British troops. On Sept. 25 it was announced that General Albert Lelong had been appointed to command French troops in Madagascar.

Martinique, Guadeloupe and French Guiana.—See *French Possessions in America.*

St. Pierre and Miquelon.—See *French Possessions in America.*

French India.—In January the governor, Louis Bonvin, stated that the colony was still governed by the laws of the Third Republic.

French Oceania.—It was announced on Oct. 15 that Christian Maigret had been appointed temporary governor. In November, Jacques Tallec was appointed commissioner general in the Pacific, governor of New Caledonia and high commissioner of France in the New Hebrides.

French Indo-China.—An agreement was reported to have been signed with Japan for the export of grain. (*See* also LEBANON; PACIFIC ISLANDS, FRENCH; SYRIA.) (X.)

French Possessions in America.—The French colonies in America are in three regional groupings: two small islands at the mouth of the Gulf of St. Lawrence, St. Pierre and Miquelon (area: 93 sq.mi.; pop. 4,000); French Guiana and Inini, on the east coast of South America north of the Amazon river (area: *c.* 34,700 sq.mi.; pop.: *c.* 36,000); some half-dozen islands in the Lesser Antilles, of which the most important are Martinique (area: 386 sq.mi.; pop.: 255,000) and Guadaloupe (area: 583 sq.mi.; pop.: 304,250). The total area of the remaining islands is 104 sq.mi.; pop.: approx. 33,000. About 95% of the pop. is Negro or mulatto.

The opening months of 1943 found the southern French possessions in serious circumstances. While the French West Indies had officially announced independent action in relation to Vichy France, the administration had remained loyal to that government and had refused to co-operate with the American nations. For this reason the United States had cut off diplomatic and commercial relations in Nov. 1942, and no vessels arrived in the

French colonies with supplies. Stocks of supplies had already been short, and real hardship followed.

On March 16 a bloodless coup by army officers, supported by the populace, seized control in French Guiana and declared adherence to the Free French cause. Jean Rapenne was appointed governor of the colony by General Giraud. Brazilian and United States military observers arrived at Cayenne at the end of the month, and much-needed supplies followed with a consequent improvement in conditions.

In the Antilles the governor, Admiral Georges Robert, held out until June 29 when he requested that United States plenipotentiaries be sent to discuss a transfer of authority. After a conference, Henri-Etienne Hoppenot was named high commissioner of the Antilles by the French Committee of National Liberation. Admiral Robert resigned July 13, and by August was on his way to Vichy. United States shipments to the islands were then resumed with an improvement in conditions, but strict control over profits was retained, and sale of autos, tires and tubes was carefully rationed.

In St. Pierre and Miquelon a Council of Fisheries was established, replacing a former consultative commission. Prohibition of the export of postage stamps w s ordered April 29.

Trade and Resources.—Trade statistics were not available; the shipping shortage and the political situation reduced the trade of the southern French colonies to a standstill in the early part of the year. St. Pierre and Miquelon in 1942 exported dried fish to the amount of 50,596 short tons (the total codfish catch was 88,690 tons; in 1941 it had been 83,683 tons). Cod-liver oil production for 1942 amounted to 2,475 gal. common, and 3,200 gal. steam process, oil. In 1942 the production of silver and platinum fox skins was 306.

In normal times French Guiana exports gold, cabinet woods, fish glue, rum and cacao. The French West Indian islands produce mainly sugar, rum and bananas for export, with lesser output of cacao, coffee and vanilla. Both areas depend on imports for the greater part of food requirements, and all nonfood needs.

French Literature.

After the occupation of all metropolitan France by the German troops in Nov. 1942, the only books or news of books that seeped across French frontiers were brought by underground representatives or by occasional refugees, with the result that only the most fragmentary information was available.

Two new elements would appear to have characterized the literary scene inside France during 1943: namely, the appearance of an organized underground literature functioning in defiance of the nazis (*Editions de Minuit, Cahiers de la Libération, Lettres Françaises*—not to be confused with the review of the same name in Buenos Aires—etc.) and the final withdrawal into silence of most of the established prose writers after the disappearance of the so-called "unoccupied" zone.

The poetic renaissance, already noted in 1942, gained in momentum during 1943. Foremost among the participants in this attempt to forge a secret language of communication through the medium of poetry were the former Surrealist poets, Aragon and Eluard, both of whom furnished brilliant examples of the poetry of resistance through allusion (see *Les Yeux d'Elsa,* by Louis Aragon, *Un Seul Nom,* by Eluard). Henri Michaux, Alain Bousquet, Pierre Emmanuel, Jacques Destaing, Maurice Hervent, Armand Robin, Lanza del Vasto and others figured among those taking part in this poetic conspiracy.

After three years of "collaborationist" direction under the editorship of Pierre Drieu la Rochelle, and an unsuccessful attempt to return it to its former editor, Jean Paulhan, the famous *Nouvelle Revue Française* died an ignominious death in the summer of 1943. This fact, along with a few others such as the incarceration of André Malraux, the execution by the nazis of Jacques Decour, editor of the clandestine *Lettres Françaises,* suffice to describe the condition of writers inside France during this year of terror and suffering. The only ones, apparently, who were able to make themselves heard were the "collaborators"—among whom were Henry de Montherlant, Pierre Drieu la Rochelle, Louis Ferdinand Céline, Alphonse de Chateaubriant, Fernandez, Abel Bonnard, Jacques Chardonne, Abel Hermant, Paul Morand, Henry Bordeaux, Jean Giono—every means of modern publicity having been put at their disposal by the occupation authorities. This list is not long if it is recalled that France counted at least 100 outstanding names and fully five times as many talented, if less known, writers. The others either worked in silence on manuscripts that could only appear in a liberated France, contributed anonymously to the clandestine press, or were content to publish barbed literary criticism, historical essays, etc. which permitted them to define their attitude.

The majority were said to be living in circumstances of great material distress.

In Switzerland the *Cahiers du Rhône* (Albert Béguin, director) which edited Aragon's *Les Yeux d'Elsa,* published a discussion of *Le Génie de la France,* in which Aragon, Thierry Maulnier, Stanislas Fumet, A. Rousseau, G. Cattani and others participated. These texts could not be consulted in the United States. In all, some 40-odd volumes by French writers were brought out in Switzerland, in Neuchâtel, Lausanne, Geneva, Fribourg: a novel by Edmond Jaloux, *Le Culte Secret, Le Théâtre des Esprits,* by Marcel Brion, *Un Homme Pressé,* by Paul Morand, several volumes of poetry and a miscellany of novels, literary criticism, historical essays, etc.

Across the Mediterranean, in Algiers, the literary event of 1943 was the liberation of André Gide which resulted from the Allied occupation of Tunis, where Gide had been as much a prisoner of the nazis as he would have been in France. His description of the Allied victory in Tunis was published in book form together with a collection of *Interviews Imaginaires,* which, in stressing the importance of conserving the integrity of the French language, managed to convey subtly and with his accustomed artistry, the undying French love of liberty. Although André Gide was in 1943 over 70 years old, he was said to be planning the publication of a review, *Arches,* in collaboration with Robert Aaron (formerly of the N.R.F.) to appear in Algiers. The brilliant Algerian review, *Fontaine,* continued to appear regularly and published one number that was entirely devoted to the literature of the U.S.A. A long poem by Philippe Soupault, written in his best vein, "Ode à Londres," was published by *Fontaine* after the author's liberation from a Tunisian prison.

Mention should be made of the continued appearance of *La France Libre* in London, a review which although not primarily concerned with literary matters, nevertheless maintained its usual high literary standard and rendered important service by publishing extracts from such clandestine French papers as *L'Art Français, L'Université Libre, Les Lettres Françaises,* etc. An anonymous novelette from France, *La Patrie Secrète,* appeared in serial form. A series of articles by René Avord on *La Pensée Française en Exil* furnished an interesting analysis of the works of Jacques Maritain and Georges Bernanos, among others. After the 1943 fall issue, the editor of *La France Libre,* André Labarthe, transferred his own activities and those of the review to the United States. Further French literary events in London were the reprinting of books smuggled from France: *Silence de la Mer, Les Yeux d'Elsa* (Horizon-France Libre), and the publication of leaflets to be dropped on France by the R.A.F., *La Revue du Monde Libre,* with contributions by Paul Eluard, Rebecca West, René Avord, Salvador de Madariaga and others.

The new world witnessed a great increase in the publication of French books, reviews, pamphlets and newspapers, both in North and South America. A new weekly, *France-Amérique,* appeared in New York under the editorship of Henri Torrès and Emil Buré, and to the list of French publishers in that city was added that of Jacques Schiffrin (former director of the *Editions de la Pléiade,* Paris) who inaugurated his activities with André Gide's *Interviews Imaginaires,* and reprints from clandestine French editions. Although a generally excellent literary standard characterized the 100 or so French books published in the western hemisphere during 1943, it is scarcely an exaggeration to say that except for many notable reprints, at least four out of five were inspired by events after 1940 and were either historical, economic or political —very often political—in character. In addition to the Gide volume, a few scientific books, such as Dr. Paul Rivet's *Les Origines de l'Homme Américain* (Collection France Forever, Editions de l'Arbre, Montreal); a number of war diaries, the most outstanding of which were those of Jean Hélion and Jean Malaquais; an important contribution to the history of the French tragedy by the great French journalist, Pertinax, entitled *Les Fossoyeurs*; Vladimir Pozner's novel of occupied France, *Gens du Pays;* Roger Caillois's brilliant collection of essays entitled *Communion des Forts;* André Labarthe's *Retour au Feu,* a moving account of the French participation in the battle of North Africa; a children's book by Antoine de St. Exupéry, *Le Petit Prince;* a new volume on Byzance by the great orientalist, Professor Henri Grégoire—constituted the more important prose works published in the Americas during 1943, in book form. A long poem by André Breton, the right to publish which was denied him by Vichy in 1940, appeared under the imprimatur of "Sur," in Buenos Aires.

To the list of existing reviews: *VVV* (Surrealiste, New York), *Dyn* (dissident-Surrealiste, Mexico), *La Nouvelle Releve* (Catholic, Montreal), *Amerique-Française* (Montreal), *Lettres Françaises* (Buenos-Aires), were added *Hemispheres* (New York, editor Yvan Goll), a bilingual poetry review; *Gants du Ciel* (Montreal), a well printed review of apparent new-comers; and *Renaissance,* the official review of the École Libre des Hautes Études, New York, edited by Henri Grégoire and Alexander Koyré. Of these reviews, more or less unequal in quality, it may be said that *Lettres Françaises* (edited by Roger Caillois) maintained its high literary standard and gave a more exact, more penetrating account of French letters throughout the world than did the others. It was in *Lettres Françaises* that St. Jean Perse published his most recent work, a long poem in nine parts, entitled, "Pluies." (*See* the Oct. 1943 number.) (E. Js.)

Friends, Religious Society of.

The Religious Society of Friends was in 1943 composed of 54 yearly meetings and annual conference groups with an approximate membership of 164,000, representing 30 different countries. In the United States and Canada there were 113,857 members in 1943 and they comprised 29 yearly meetings. The Friends general conference was composed of six of these yearly meetings with a membership of 17,202, with headquarters at 1515 Cherry st., Philadelphia, Pa. The Five Years meeting had its headquarters at 101 S. 8th St., Richmond, Ind., and had a membership of 69,747. The other remaining yearly meetings were Conservative and Independent associations and had a membership of approximately 26,908.

Schools, hospitals and meetings were conducted in Palestine, Africa, Cuba, Mexico and Jamaica by the board of missions of the Five Years meeting. The mission stations in Bolivia, Honduras, Guatemala and Alaska were continued under the care of Oregon and California Friends. In Denmark, France, Germany, Holland, Norway, Sweden and Switzerland, the yearly meetings of Friends continued to be active. There were also organized meetings in China, India, Syria and Palestine, Africa, Australia and New Zealand. The yearly meeting in Japan was discontinued due to the formation of the national church in Japan.

A new directory of all meetings for worship in the United States and Canada was published by the American section of the Friends World Committee for Consultation with headquarters at 20 S. 12th St., Philadelphia.

The American Friends Service committee in the United States co-operated with the Friends' Service council in England in humanitarian services of relief, child feeding, assistance to refugees, Japanese relocation, social industrial rehabilitation, peace

education and civilian public service.

The American Quaker Workers had to leave France and were interned at Baden-Baden, Germany. The European staff members carried on under the organizational name "Secours Quaker" and were responsible for 350 children in colonies, distributed milk daily to 4,000 babies and extra food ration to 2,500 children in public schools. Four workers were active in North Africa assisting in the liberation of refugees still in internment camps.

The American Friends Service committee co-operating with the National Japanese Student Relocation council assisted in locating 2,000 American-born Japanese students in colleges outside the Japanese internment camps. Hostels were established in Chicago, Ill., Cincinnati, Ohio, and Des Moines, Iowa, where Japanese were assisted in finding new work.

The summer projects of the peace section included two International Service seminars. One was held at Guilford college, North Carolina, and was composed largely of students from Latin American countries. The seminar at Camp Kanesatake, Pennsylvania, was made up of students from Europe and the orient. Three groups of young people worked on projects of rural rehabilitation in Mexico.

The social-industrial section of the service committee conducted eight work camps for college and high school students. The camps were located to serve a fishing community in Vinal Haven, Maine; a migrant labour camp in New Jersey; a marginal farming community in Missouri; Negro neighbourhoods in Chicago, Ill., and Indianapolis, Ind.

Civilian public service continued as an alternative to military service provided for conscientious objectors by the National Selective Service act. The Society of Friends in co-operation with the Brethren and Mennonites operated the C.P.S. camps where men carried on work of national importance. Nearly 7,000 men were in these C.P.S. camps. About 28% of the men received maintenance for the services they rendered in mental hospitals, dairy farms, agricultural experiment stations, and in coast and geodetic service. The others, or 72%, paid their own maintenance and worked on projects of forest service, soil conservation, park service and farm security. A unit of 70 men prepared to go to China to work with the Friends ambulance unit in transporting medical supplies and nearly 200 men entered colleges for special courses on postwar reconstruction, but both of these projects were made void by an act of congress in July 1943.

The Religious Society of Friends is a spiritual movement which was started in England over 250 years ago. The founder, George Fox, emphasized the dignity and worth of the individual as having direct access to God. Quakerism, as the spiritual movement is often called, is known as a Way of Life which recognizes the divine nature of human beings, believes in the equality of all races, encourages simplicity and naturalness in thought and action, and maintains a pacifist testimony. The meetings for worship are conducted in an atmosphere of quiet reverent waiting in which any of the members may participate in vocal ministry as led by the Holy Spirit. (L. D. Sh).

Fuel Briquettes. Although the United States is only a minor producer of fuel briquettes, it was the only country from which data were received. Production increased from 1,298,606 short tons in 1941 to 1,748,300 tons in 1942, with 30 plants in operation in 14 states. (G. A. Ro.)

Fuel Oil: *see* Business Review; Petroleum; Rationing.

Fuller's Earth. In 1941 the production of fuller's earth in the U.S. broke the decline that had been under way for more than a decade, and increased to 207,446 short tons, 43% over 1940, though some of this increase was due to the inclusion in the figures of considerable tonnages of Texan material which had not heretofore been classed as fuller's earth. In 1942 the output dropped to 204,244 tons. (G. A. Ro.)

Fuqua, Stephen Ogden (1874–1943), U.S. army officer, was born Dec. 25 in Baton Rouge, La. A student at West Point, 1892–93, he was an infantry captain with the U.S. volunteer army during the Spanish-American War and served in the Mexican expedition in 1914. During World War I he served in France on the operations section of the staff of the First Army and as chief of staff of the First Division, with rank of temporary colonel. He was made chief of infantry in 1929 with rank of major general, a promotion which skipped him over the heads of 165 colonels and brought about considerable opposition in army circles. He held that post until 1932, when he was named military attaché to Spain. He returned to the United States in the fall of 1938 and retired from the army at the end of that year. He afterward became military affairs editor for *Newsweek* magazine. He died in New York city May 11.

Furniture Industry. All production records for the furniture industry in the United States were broken during 1943 when approximately $1,000,000,000 worth of wooden household furniture, army and navy furniture, defense housing furniture, aeroplane parts, boat hulls, and other war equipment were produced by the 2,250 factories comprising the industry. Of the 2,250 factories, approximately 750 were engaged entirely in war work; of the remaining 1,500, approximately half were devoting about 50% of their productive capacity to war contracts but producing also some civilian furniture.

Despite the great shift during 1942 from peacetime to wartime production, the industry shipped in 1943, $550,000,000 worth of household furniture to merchants, a drop of only 18% below 1942 shipments of $630,000,000.

At the close of 1943, WPB issued an order limiting furniture manufacturers to 84% of the hardwood lumber they had used in making civilian furniture during 1943 and banned the production of such "non-essentials" as home bars, cellarettes, magazine racks, tea wagons, curio cabinets, pier cabinets, what-nots, chaise longues, record cabinets, Lazy Susans, bird cages and stands, ferneries, towel racks and juvenile bookcases, chiffoniers, wardrobes and toy chests. These ordinarily account for but 2% of the industry's output.

At the same time, WPB placed restrictions upon the use of seven critical hardwoods by the industry: ash, beech, yellow birch, hickory, hard maple, oak and rock elm. Since these woods were scarce for six months, few factories used them except for war work and government housing projects.

Few furniture plants ceased operations during 1943 and these were upholstering firms that refused to continue production when the use of spring wire was denied the industry. After shipping all the furniture with springs they were able to complete before the government deadline, about 25 factories discontinued operations for the duration. All others adopted wooden springs or padded construction or secured government contracts to maintain operations.

Furniture markets were discontinued in High Point, N.C., and Los Angeles during 1943 because the exhibition buildings for-

merly devoted to home furnishings were taken over by government agencies. Markets continued to be held, however, in New York, Chicago, Grand Rapids and Jamestown, N.Y., although on a limited scale compared with normal times.

The manpower shortage was being partially relieved by the use of women. Government reports showed 25,000 employed in 1943 in furniture plants, representing about 20% of factory personnel. While the number of employees dropped 20% during the year, pay rolls were down only 8%, due to overtime, etc.

No reports were available regarding furniture production outside of the United States. (*See* also INTERIOR DECORATION.)

(J. A. G.)

Furs. The year 1943 brought a very large volume of business to the American fur industry. Based on U.S. treasury department tax figures, the cash turnover of furs in retail stores totalled approximately $450,000,000. The revenue derived by the government from the 10% tax on fur apparel was therefore approximately $45,000,000. All branches of the industry shared profitably in this turnover. Prices were higher than in 1942, but were prevented from going to extreme levels by the restraining influence of the OPA regulation which attempted to establish ceilings on fur skins and manufactured garments. Business in furs increased steadily month after month and since there were no strikes or labour difficulties, other than a growing shortage of skilled workers, production was maintained at a steady pace throughout the year instead of being concentrated in the summer months, as in previous years. The manufacturing branch of the industry benefited by this spreading out of the manufacturing season and the consequent elimination of the customary slack period, which was usually accompanied by unemployment. The industry, for the first time in a decade, ended the year without a surplus of merchandise since demand managed to keep ahead of supply throughout the 12 months.

The supply of American and Canadian raw furs was somewhat less than in 1942, especially of the farm-bred furs such as mink and silver fox. It was one of the biggest years for mink fur in the history of the trade. Prices on this fur, because of a large carry-over of mink skins from 1942, enabled manufacturers to buy mink at very reasonable prices and supply the public with good mink coats at comparatively low prices. This fur sold freely and by October of 1943 the supply was pretty well exhausted. There was an exceptional demand for scarfs and neckpieces made from mink.

Muskrat was the most popular fur of the year, and was dyed and worked to resemble mink. The next most popular fur was Persian lamb, which was in very good supply through shipments from Russia, Afghanistan and southwest Africa. The trade drew its largest supply of lambskins from Africa and shipping space, in spite of restrictions, was found on ships returning from Cape Town. Silver fox, beaver, nutria, red fox, skunk, raccoon and opossum were all furs in great demand. The favourite coat style of the year was the tuxedo front fashion. Canada was the largest source of so-called foreign furs, but the United States also imported nutria, viscacha, pony, kidskin, skunk, fox, lambskins and spotted cat from the Central and South American countries. The United States did not receive any furs from India or the far east, but imported quantities of rabbitskins, opossum, wallaby and fox from Australia and New Zealand. Actual import figures were not issued by the government.

The trade complained constantly to the OPA about the inequalities and the impractical provisions of regulation No. 178, which governed fur prices. OPA finally agreed to hold hearings and, after months of consultations with different branches of the trade, decided to revise the regulation and announced that the new regulation would be ready in November. The fur trade waited for the OPA announcement, but finally was forced to go ahead and operate under the old regulation. Up to the end of the year there had been no further word from the OPA. It was expected, however, that the new regulation would go into effect by the spring of 1944. This regulation would attempt to hold fur prices at the same levels as prevailed in 1942.

Up to the end of Nov. 1943 there were 81 failures in the American fur industry, with total liabilities of $1,387,758, according to the American Fur Merchants association of New York. Most of these failures were in the New York trade and were fewer than at any time from 1938 to 1943. Out-of-town firms transacted anywhere from 50% to 100% more business than they did in the previous year and hundreds of thousands of new consumers were found in areas which gave employment to millions of workers in war industries. War workers brought about a demand for a somewhat better type of garment than in former years. The most popular price range was between $200 and $300 for a coat. Manufacturers and retailers ended the year in a strong financial condition and with only limited stocks of merchandise to carry them into the new year, with the possible exception of some of the higher priced luxury garments. The raw fur season of 1943 which began in November found the fur markets greatly in need of fresh pelts. Prices paid to trappers and fur farmers were up about 50%, on the average, as compared with the opening prices in 1942. There appeared to be a somewhat short catch and a disregard in the country collecting points for OPA ceiling prices.

The fur industry provided the American and Allied merchant seamen with fur-lined vests free of cost through the fur vest projects in New York, Chicago, Los Angeles, San Francisco, Milwaukee and other cities. Both labour and management provided the time, the material, and the labour-hours, in co-operation with the member workers of the International Fur and Leather Workers union.

(W. J. BT.)

FWA: *see* FEDERAL WORKS AGENCY.

Gager, Charles Stuart (1872–1943), U.S. botanist, was born Dec. 23 in Norwich, N.Y. (For his early career, see *Encyclopædia Britannica.*) In 1910 he became director of the Brooklyn Botanic garden, a position which he held until the time of his death. Dr. Gager engaged in a large variety of scientific enterprises. He edited the *Brooklyn Botanic Record,* beginning in 1912, and was business manager of the *American Journal of Botany,* 1914–35. He also became business manager of *Ecology* in 1920, and of *Genetics* in 1922. He wrote widely in scientific and educational journals and published, in addition to several earlier works, *The Plant World* (1931). Dr. Gager served on several committees of the National Research council, and was a member of the botanical committees for the Chicago and New York world fairs. On June 4, 1941, Swarthmore college honoured him with the Arthur Hoyt Scott Garden and Horticultural award. He was president of the Botanical Society of America in 1936. In 1941 he was elected an honorary member of the Royal Agricultural and Horticultural Society of India. He died on Aug. 9.

Galway, George Vere Arundell Monckton-Arundell, 8TH VISCOUNT, (1882–1943), Irish peer, was born March 24. He was educated at Eton and at Christ Church, Oxford, where he received his B.A. and M.A. degrees. He served in World War I and was in command of the Life Guards when he retired from the army in 1929. He succeeded to the title in 1931. Viscount Galway served as governor general of New Zealand, 1935–41. He died March 27.

Gambia: *see* BRITISH WEST AFRICA.

Gandhi, Mohandas Karamchand (1869–), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica.* On Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20, 1940, delegated to him the direction of negotiations with Great Britain for national independence. On Sept. 17, 1940, the congress committee elected Gandhi its leader. In April 1941, he announced that the congress had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolence. On Dec. 30, 1941, Gandhi resigned from its leadership.

On March 27, 1942, Gandhi conferred with Sir Stafford Cripps; later he rejected the latter's proposals for Indian postwar independence. On Aug. 9, after the All-India Congress party had approved his proposals for a civil disobedience campaign, Gandhi was arrested with 200 other Indian leaders and was held as a political prisoner in the Aga Khan's palace in Poona. On Feb. 10, 1943, he began a 21-day fast, precipitating renewed strikes and demonstrations among his followers. As the fast continued, small hope was held out for Gandhi's recovery, but in spite of world-wide pleas for his release he remained a prisoner, the government looking on his fast as "political blackmail." Toward the end of the month he rallied, and on March 3 he ended his fast. At the end of 1943 he was still a prisoner. (*See* also INDIA.)

Gas, Natural. The total production of natural gas in the United States in 1941 was estimated at 4,104,000,000,000 cu.ft.; after deducting losses of 630,000,000,000, 16,000,000,000 pumped back into the ground for storage and 644,000,000,000 for repressuring the field, the marketed total amounted to 2,813,000,000,000, an increase of 22% over 1940. In 1942 the marketed production increased 9% to 3,055,000,000,000 cu.ft., of which the various leading uses took the following percentages: light, fuel and power in the producing field 22%; domestic use 16%; carbon black plants 11%; electric power and public utility plants 7%; petroleum refineries and commercial uses each 6%; the remaining 32% included a wide variety of minor industrial uses and a small amount exported, mainly to Mexico. Natural gas was piped to and sold in the following states, in addition to the 26 states in which it is produced: Alabama, Arizona, District of Columbia, Florida, Georgia, Iowa, Maryland, Minnesota and Nebraska.

In 1942 a total of 3,000,000,000,000 cu.ft. of natural gas was treated for the recovery of natural gasoline vapours, resulting in the production of approximately 1 gal. of natural gasoline for each 1,000 cu.ft. of gas treated.

Canadian production in 1942 was 42,700,000,000 cu.ft., a reduction of 2% from 1941. (G. A. Ro.)

Gasoline: *see* PETROLEUM; RATIONING.

Gaulle, Charles de (1890–), French soldier and leader of the forces of Fighting France after the armistices of June 22–24, 1940, graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east. Foreseeing the future tactical importance of tanks and combat cars, he waged a one-man campaign to persuade France to mechanize her infantry after 1918, but army officers preferred to place their trust in such measures of immobile defense as the Maginot line. The first several days of Germany's lightning thrust through Belgium and the Netherlands in May 1940 proved the correctness of de Gaulle's theories, and he was belatedly made undersecretary of war in Reynaud's cabinet. He parted ways with Marshal Pétain's government when it elected to surrender, and he fled to London. There on June 23, 1940, he announced formation of the French National committee, an expatriate military and political organization. Many French possessions in Africa, Asia, Oceania and the Americas rallied to de Gaulle's banner. His attempt to seize Dakar, with British aid, in Sept. 1940 was repelled by Vichy-controlled forces, but in 1941 Syria, Lebanon, St. Pierre and Miquelon joined his movement. In September of that year the Free French National council was formed with de Gaulle as its president. He aligned his policy with that of the U.S. and Britain, concluded a politico-military alliance with the U.S.S.R. and declared his council at war with Japan, Dec. 8, 1941. During 1942, the French underground factions united and accepted de Gaulle's leadership in the struggle against the axis. After Adm. Jean Darlan's assassination in Dec. 1942, de Gaulle made repeated efforts to meet with Gen. Henri Giraud, the admiral's successor but was snubbed by the French general. Angered by Giraud's attitude, de Gaulle in early 1943 called Giraud's regime "baseless and artificial." Giraud was finally compelled to confer with the Fighting French leader, who was supported by the majority of Frenchmen in North Africa as well as France. The two leaders met in Algiers and on June 3, 1943, announced formation of the French Committee of National Liberation, a trustee government to administer French interests until the Germans were driven out of metropolitan France. On Nov. 9, 1943, de Gaulle assumed full control of the French committee, and Giraud resigned as co-president.

Gems and Precious Stones. With Burma, Thailand, and Indo-China in Japanese hands, access was lost to an area that previously had supplied a large portion of the demand for precious and semiprecious stones other than diamonds, and in other areas, such as India, Ceylon and Australia production was hampered. Increased trade in South America brought to the United States greater supplies of many semiprecious stones, and domestic production supplied a fair amount, though considerably less in 1942 than in previous years. The only precious stone mined in the United States is the sapphire, of which about 50,000 oz. was produced in 1942; some of this was of gem quality but the bulk of the output was for instrument jewels. The value of crude gem stones produced in the United States in 1942 was estimated by the U.S. bureau of mines at $150,000 as compared with $240,000 in 1941; when cut, these values were increased to $400,000 and $770,000 respectively. Sapphires represented 31% of the total, turquoise 21% and various quartz minerals 20%. Producing states, in decreasing order of importance were Montana, Nevada, Oregon and Wyoming. Genetics. The work of Lindegren and Lindegren on the genetics of commercial yeasts made available an important new source of high protein- and vitamin-rich foods at low cost. They isolated rapidly growing strains with different taste qualities which might be used in the production of nutritious and palatable synthetic foods, grown rapidly on inexpensive sub-

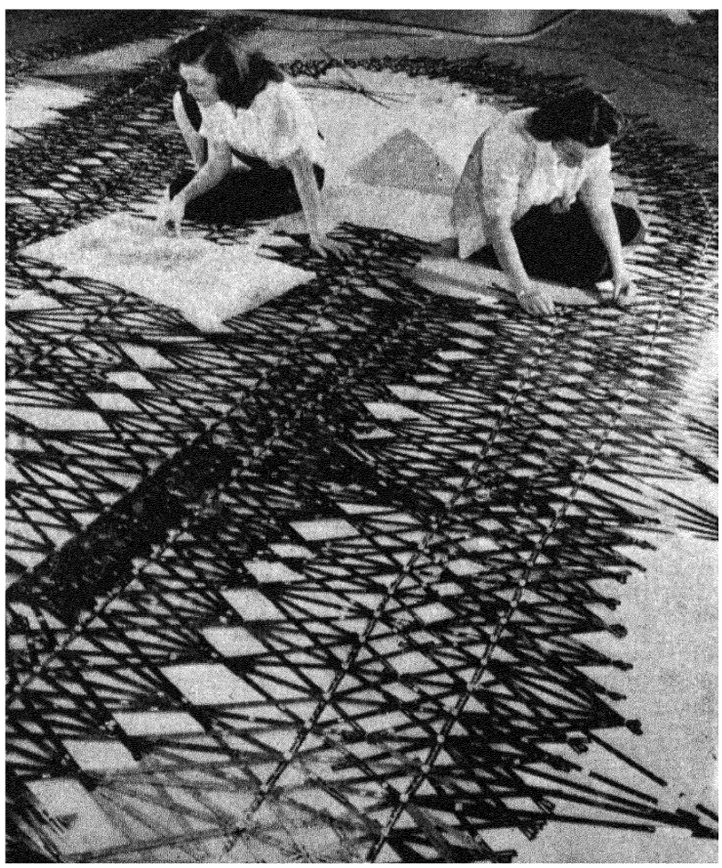
strates.

Serological Genetics.—Wiener and Sonn studied the linkage of the Rhesus factor first reported by Landsteiner and Wiener as a dominant which, when present in the human foetus of a recessive, rh-negative mother, may lead to the highly fatal condition, erythroblastosis foetalis. They found that the Rh-rh factors are not linked to the blood group genes, A, B, O or to the M, N blood factors. Thus three pairs of human chromosomes in addition to the sex-chromosomes were known in 1943 to carry genetic markers usable in further linkage studies through the wide distribution of contrasting alleles in human populations. Neel and Valentine showed that the rare blood disease, thalassemia or Cooley's anaemia, fatal in infants, is due to an incomplete recessive. They reported on the abnormal blood picture of the heterozygotes. This was the first case in which the carriers of a condition of medical importance could be certainly recognized.

In mice, Gowen and Calhoun separated strains with differential resistance to mouse typhoid and showed that these differ in the numbers of leucocytes. Gruneberg found that the recessive gene for flexed tail in mice also produces an anaemia characterized by development of erythrocytes, deficient in haemoglobin and rich in detachable iron, over a long period of embryonic life. Sawin and Glick discovered that an atropine hydrolyzing enzyme in the blood of rabbits is conditioned by an incompletely dominant gene, with higher incidence in some rabbit strains than in others. Irwin and collaborators continued the genetic analysis of cellular antigens in species crosses of pigeons and doves.

Physiological Genetics.—Waddington traced the development of several leg mutants in *Drosophila* in prepupal and pupal stages. Goldschmidt reported on a series of wing shape alleles at two loci in *Drosophila* and found one case of interaction between alleles at these loci which represents a threshold condition where lines differing in genetic modifiers may be isolated, giving symmetrical and asymmetrical expressions of wing characters. Stern showed that the factor, cubitus interruptus, in *Drosophila* has an effect cumulative toward the wild-type character in haploid, diploid and triploid doses. From reactions of the ci alleles in these combinations and in heterozygous combinations with wild-type alleles at this locus he has proposed a theory of gene action based on (a) presence of and amount of a substrate in the cell; (b) combining action of gene with substrate; (c) efficiency of gene in utilizing substrate. Mampell described a dominant "mutator" gene in *Drosophila pseudo-obscura* which increases normal mutation rate 34 times in the heterozygote and 70 times when homozygous.

Radiation Genetics.—Radiation experiments on plants and animals showed that neutron radiation and X-ray radiation in equivalent doses as regards ionization behave differently in inducing chromosome breaks and gene mutations. Neutrons produce more chromosome breaks; X-rays induce more point mutations. Eberhardt found more breaks in the fourth chromosome of *Drosophila* after neutron radiation. Giles found higher breakage from neutrons in the plant, Tradescantia; higher lethal mutation rate in *Drosophila* from X-rays. Lea and Catcheside decided that breaks in Tradescantia chromatids are produced by not less than 17 ionizations per chromatid. They considered that dense ionization along neutron paths explains their effectiveness in causing breaks. Conversely, only as a fast electron slows up (tail of the path) is the ionization dense enough to produce breakage.



Genetics and Evolution.—The book of 1943 in this field is by Julian Huxley (see *Bibliography*). Many genetic and cytogenetic studies on speciation, particularly in plants, appeared. Faberge reported on extensive eco-genetic work on populations of Iceland and Alpine poppies. He established that many taxonomic characters in this group are due to single genes or combinations of two genes. Charles and Goodwin analyzed the minimum gene differences for leaf characters in two species of goldenrod which hybridize. Moore crossed the dominant non-spotting mutation in the frog, *Rana pipiens*, to two other species and proved it dominant in them. Wharton published a comparative study of the metaphase and salivary chromosomes of 86 species and subspecies of *Drosophila*. She concluded that chromosome configuration *per se* is less important in speciation than was formerly supposed. Dobzhansky and Wright continued the analysis of the genetic structure of natural populations, based on field-laboratory studies of *Drosophila pseudo-obscura* and the desert plant, Linanthus. They found that *Drosophila* populations vary seasonally in gene structure, apparently in adaptive response to environmental factors through natural selection.

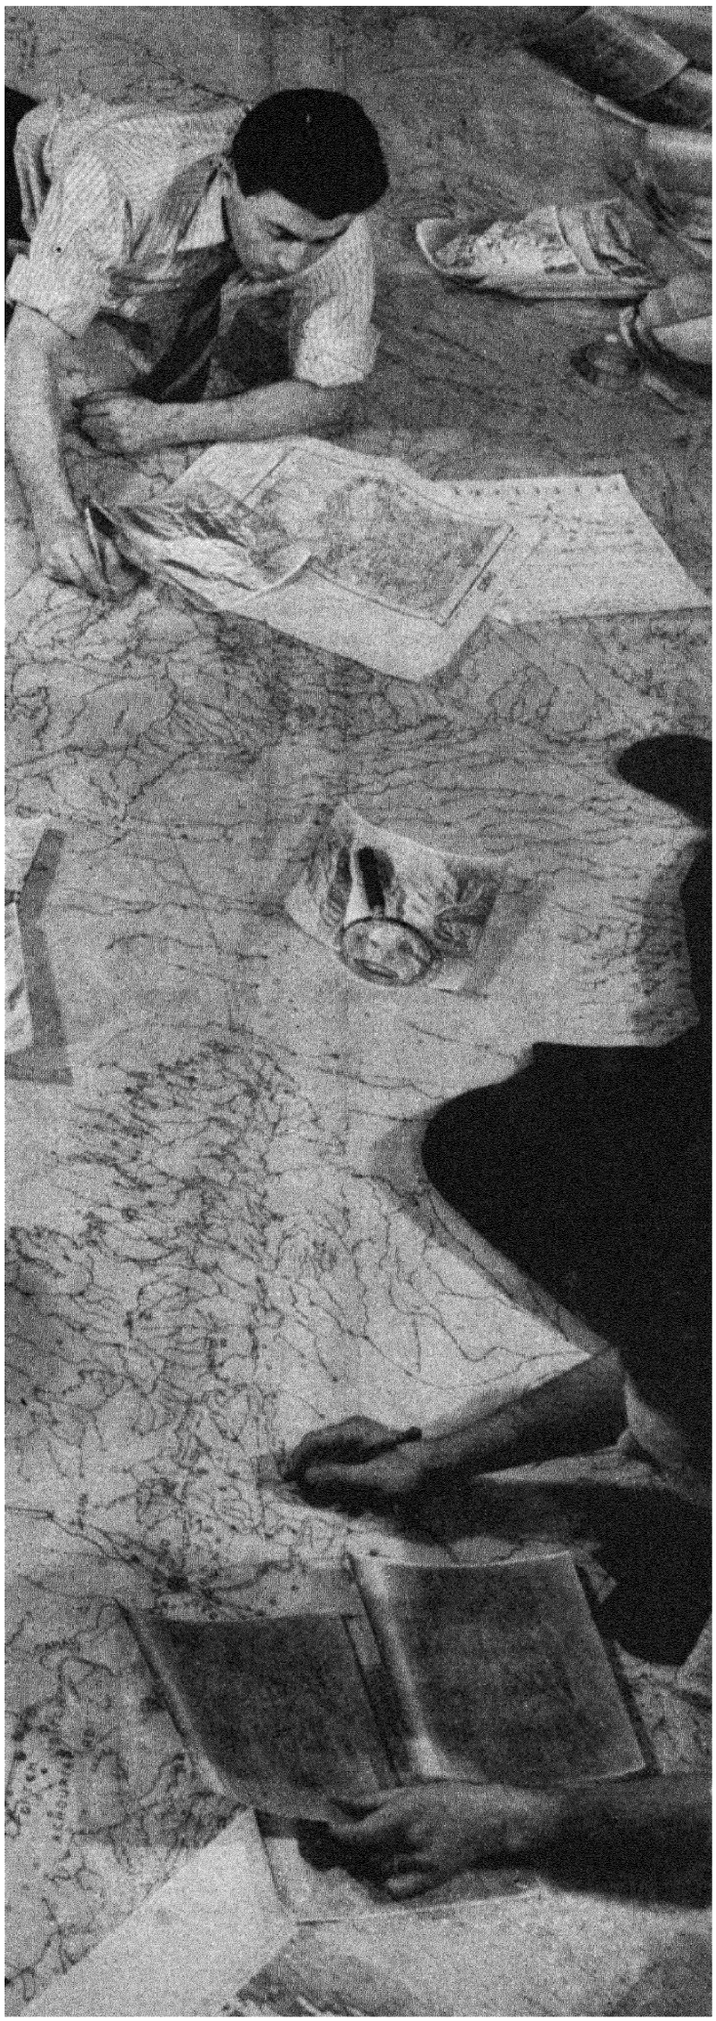
Geographical Society, American: *see* AMERICAN GEOGRAPHICAL SOCIETY.

Geography. War in foreign lands inevitably gives rise to a demand for geographic information out of all proportion to the interest shown in peacetime. This effect, though important also in other fields, is probably more striking in the case of geography than that of any other profession, other than the military professions themselves. It is particularly marked in the United States, a country whose people have been accustomed to think of foreign lands as remote and of minor importance to them but in 1943 found the specific beach characteristics of tiny Pacific islands half way round the world of vital importance to their sons. In World War I, which was concerned primarily with Europe and in which Americans fought chiefly in France and Italy, U.S. geographers were called upon in considerable numbers to assist the government as well as to furnish

GIRL OPERATORS putting together a maze of slotted templates to serve as a base for a map compilation from aerial photographs. Each strip represents the flight line of a plane; the intersections of the template arms locate the prominent features that will serve as landmarks



information for the public. In World War II, the demands were vastly greater for the issues were world-wide. Americans have fought in Africa, Europe, Asia and the islands of the Pacific, and the use of air transport caused areas previously isolated from U.S. concern to be of critical importance for the maintenance of connections to and from the battle fronts.

The effects on the use and development of geography are to be found in three major fields: (a) popular interest in information concerning battle areas; (b) the demand for precise geographic information concerning almost all foreign areas by the federal government, primarily for the military services, the other war agencies and the state department; (c) the requirements for geographic training of selected military personnel in the army and navy training courses in hundreds of colleges and universities.

Popular Interest.—The reaction of the press to public interest in the geography of war areas was immediate. The most obvious measure was the great increase in use of maps in newspapers and magazines. In some of the latter, professional geographers introduced marked innovations in cartographic art, in many cases with notable success. The U.S. public was acquiring an education in the geography of the world such as it never had before. The comparative ease with which small handfuls of leaders could be transported across oceans and continents almost overnight, in contrast with what appeared as the pedestrian pace of troops shipped in convoys, stimulated imaginative predictions of a new world to come. If some of these publications in serious magazines, and even in book form, appeared to be influenced by the example of Superman and deserved place only in Sunday supplements, they were nevertheless symptoms of a stirring of the national thought toward a truer appraisal of the kind of world in which it lives.

Geography in War Agencies.—Whereas the federal government during the 1930s had increasingly utilized geographers in the study of domestic problems, practically none, except for a small unit in the state department, were engaged in study of the geography of foreign lands. Major steps to remedy this situation were taken, as a result of the wars in Europe and Asia, some months before Pearl Harbor. The army brought professional geographers who held commissions in the reserve corps to do intelligence work in Washington; the office of geographer in the state department was expanded, and the new Office of Strategic Services (at that time called the Coordinator of Information) set up a geography division; several geographers were added to the staff of what shortly became the Board of Economic Warfare (now included in the Foreign Economic administration).

After Pearl Harbor, all of these were rapidly expanded and various other agencies concerned with the war called upon geographers to supply expert services. By the end of 1943 more than 200 professional geographers were employed in government agencies in Washington, or nearly 5 times as many as in peacetime. In research and analysis of geographic information, as well as in the compilation and construction of maps, they performed one major part of the intelligence service provided by the military intelligence division of the army and the Office of Strategic Services, as well as the army map service and the board of geographic names. Geographers contributed detailed specific information on the terrain, climate, transport routes, food and industrial resources of each area to which U.S. troops had been sent. Geographers who were specialists in maps were included in the working staffs taken to the conferences at Quebec and Cairo. By the end of the year, geographers were at work at outposts near the battlefronts, at London, in North Africa and in the far east.

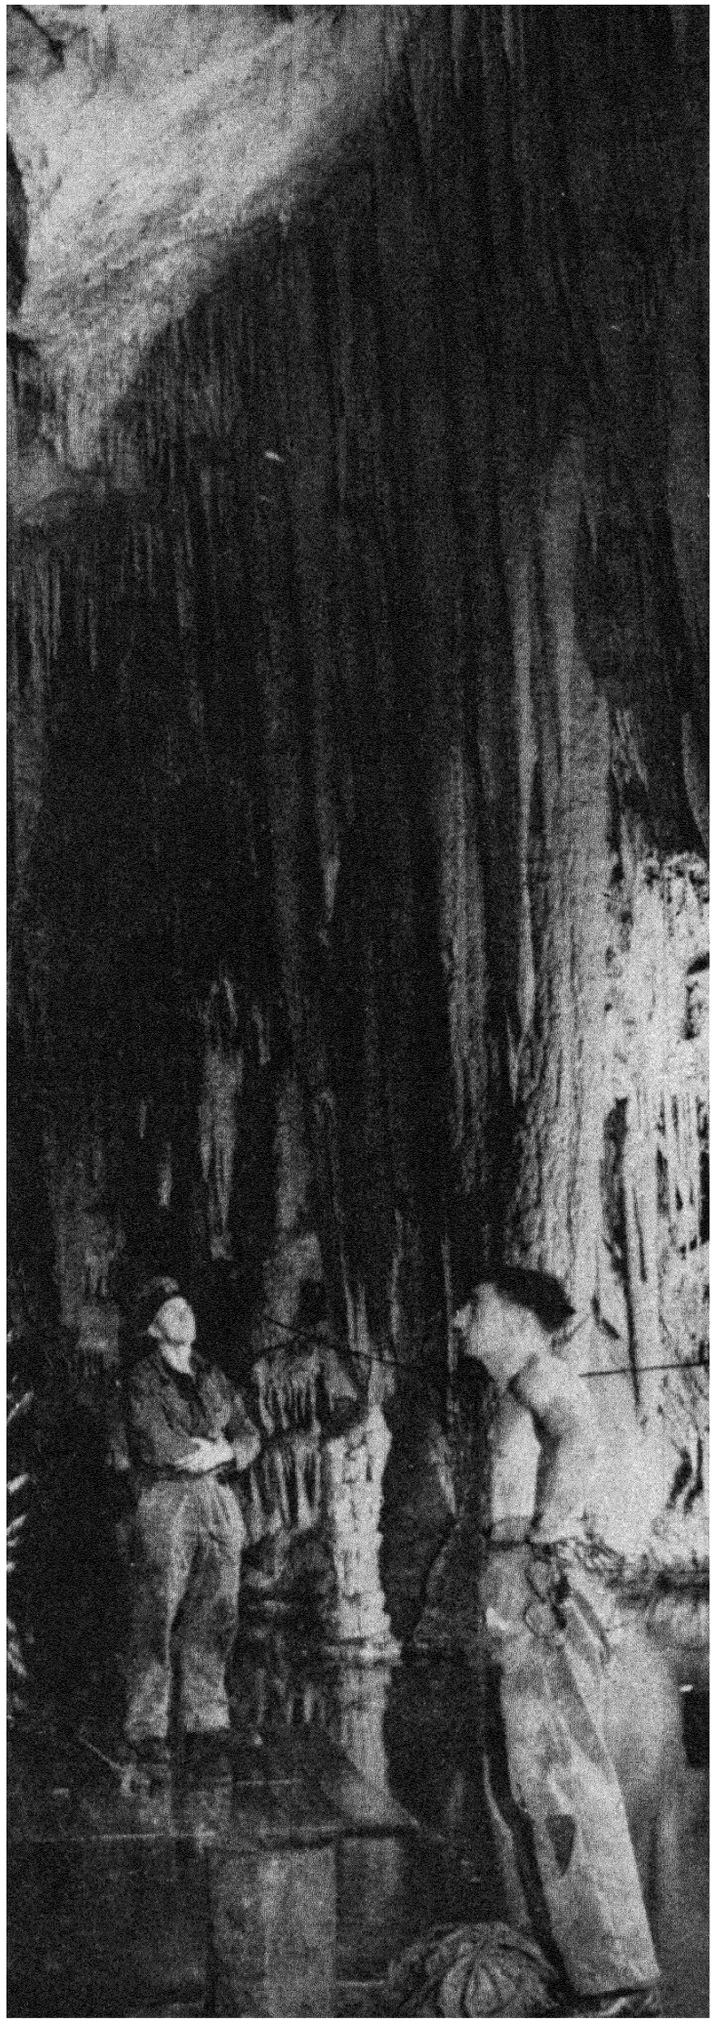
EDITING the final details on a huge map base of an army air force aeronautical chart of a section of North Africa

Whereas the first demand for geographic information had been for purposes of planning combat activities and supply routes, successful advance of U.S. troops in any area led immediately to problems of military government in occupied areas; in various of these agencies geographers were at work supplying background information needed by the authorities who had to organize the reconstruction of agriculture, industry, utilities and transport and the reorganization of civil life.

Training Courses.—In the various training courses organized in U.S. colleges and universities for the army and navy, geography played an important role. The course programs in meteorology for aviators included general surveys of world geography, and the area programs designed for officers in military government naturally required basic courses in the geography of the areas concerned. This presented almost every college in the land with a serious difficulty; those in which the study of geography had been well developed had in most cases previously lent some of their best personnel to government service for the duration. Many colleges unfortunately had not previously included the subject in their curriculum but now suddenly had its importance thrust upon them. As a result it was necessary in many institutions to draft men from related departments, from geology, or history, or from wherever, and assign them to teach with whatever preparation could be provided them almost overnight. Unfortunately, lack of national planning for this particular emergency had permitted the induction into the army of large numbers of young graduate students in the field who would otherwise have been available for this specialized service. (*See* also AMERICAN GEOGRAPHICAL SOCIETY; NATIONAL GEOGRAPHIC SOCIETY.)

(R. HAR.)

Geology. Research and writing in pure geology were at a low ebb. A number of foreign journals and at least one domestic one (*The Journal of Geomorphology*) were discontinued for the duration of World War II. European geological publications either were not reaching the United States or were greatly delayed in their appearance.



Many strategic areas in America were being mapped topographically for the first time on the basis of aeroplane photographs. This new method is three to five times faster than required by former techniques. The new system augured well for the future since less than half of the United States was carefully mapped. The new book *Aerial Photographs and Their Applications* by H. T. U. Smith is of interest in this connection.

The demands of the world conflict upon the mineral industry apparently reached their peak only in the metalliferous branch.

The need for well-trained applied geologists and geophysicists was greater than ever before as a result of the greater tempo of mineral exploration and development; yet the number of students preparing for these fields in the colleges and universities fell to a new low since the widespread application of highly specialized techniques in prospecting.

The Office of Scientific Personnel of the National Research council co-operated in an effort to alleviate the wartime personnel problem in geology by (1) assisting in placing qualified workers in positions connected with the war effort and (2) taking steps to secure deferment of those vitally needed in the mineral industry because of their special skills.

The opinion prevailed among geologists that the full potentialities of the science were not being utilized by the military authorities of the Allied nations, and that the profession was not adequately appreciated by laymen. For these and other reasons steps were taken to organize an association of geological societies

CAVE 40 FT. HIGH, discovered in the Rock of Gibraltar during military tunnelling operations. Sealed 20,000 years ago, the chamber contains a freshwater lake 40 yd. long

which might wield a greater national influence.

Geomorphology.—Of interest in this field are the books by R. A. Daly, *The Floor of the Ocean,* and C. A. Cotton, *Climatic Accidents in Landscape-making.*

Historical Geology.—A noteworthy contribution was G. G. Simpson's "Mammals and the Nature of Continents," which appeared in the *American Journal of Science* for January. This study supports the hypothesis that the continents were essentially stable throughout the period involved in mammalian history.

The March issue of the same journal carried an interesting article on paleopedology (the study of fossil soils) by C. C. Nikifovoff.

Sedimentation.—Vol. 5 of *The Report of the Great Barrier Reef Committee on Great Barrier Reef Bores* should be of interest to workers in this field. The mollusks contained in the reef are reported to be of recent age, thus indicating an extraordinarily rapid rate of deposition of the reef limestone.

The book entitled *Micromeritics, The Technology of Fine Particles* by J. M. Dalla Valle should be of special interest to metallurgists and engineers as well as to geologists.

Petrology.—A semi-popular treatise, *Minerals and Rocks—Their Nature, Occurrence and Uses,* came from the pen of R. D. George. An intriguing article entitled "Some Petrological Concepts and the Interior of the Earth" by A. F. Buddington appeared in the March issue of the *American Mineralogist.*

The report by E. B. Sandell and S. S. Goldich on "The Rarer Metallic Constituents of Some American Igneous Rocks" published in the *Journal of Geology* deals with the distribution of minor elements and gives estimates of the probable abundance of these in the earth's crust.

Vulcanology.—Attention is called to the unusual outbreak and development during 1943 of the Mexican volcano Paricutin, which arose in February from a cornfield some 200 mi. west of Mexico City. By late September Paricutin had reached a height of 1,500 ft. This is the first volcanic outbreak whose entire early history has been observed and recorded by man. It was described by P. D. Trask in *Science.*

Structural Geology.—Two books in the field of structural geology may be mentioned: *The Dynamics of Faulting and Dyke Formation with Applications to Britain* by E. M. Anderson and *Structural Petrology of Deformed Rocks* by H. W. Fairbain.

Economic Geology.—Considerable interest was shown in the subject of the political control of mineral resources. This was exemplified by the appearance of *Minerals in World Affairs* by T. S. Lovering; *World Minerals and World Peace* by C. K. Leith, J. W. Furness and Cleona Lewis; and *Strategic Materials and National Strength* by H. N. Holmes.

Much attention was given to the world's petroleum resources as a result of dwindling petroleum reserves and the expanding industrial uses for petroleum and its products. These and related problems were considered in an article in *Science,* "Petroleum—Past, Present and Future," by P. K. Frolich.

An innovation in petroleum geology was the initiation of an annual review of the science by the members of the staffs of the departments of geology, geophysics and petroleum engineering of the Colorado school of mines under the sponsorship of the Research committee of the American Association of Petroleum Geologists.

Military Geology.—The increased interest in this field was manifested by the appearance of the authoritative work on *Map Interpretation with Military Applications* by W. C. Putnam and an article by C. E. Erdmann, "Application of Geology to the Principles of War," in the *Bulletin of the Geological Society of America.* A bibliography on military geology and geography prepared by Marie Siegrist and Elizabeth Platt was issued by the division of geology and geography of the National Research council. (*See* also MINERALOGY; PALEONTOLOGY; SEISMOLOGY.)

(F. M. V. T.; B. H. P.)

George, Harold Lee (1895–), U.S. army officer, was born July 19 in Somerville, Mass. Educated at George Washington university and the National university of Washington, he was appointed as secretary to the U.S. comptroller of currency in 1917. He soon left this post, however, to join the army and was commissioned a 2nd lieutenant in the air force the same year. Remaining in the army after the war, he was closely associated with Gen. "Billy" Mitchell, the prophet of air power. When Gen. Mitchell was given the opportunity to demonstrate the value of aerial bombardment in 1921, George piloted one of the six Martin bombers which sank the ex-German battleship "Ostfriesland" during an experimental raid. He also served as a defense witness for Mitchell when the general was tried for insubordination. George engaged in experimental work in developing aerial armament and bombs at the Aberdeen Proving grounds, 1921–25, and was head of the bombardment section in the office of the chief of the air corps for the next four years. In 1940, he became commanding officer of the 2nd bombardment squadron, the first organization to be equipped with four-engined Flying Fortresses. The following year, he was named assistant chief of air staff for war plans. In March 1942, George became the commanding general of the air ferrying command, later known as the Air Transport command.

George VI. A visit by air in 1943 to all his fighting services in North Africa and the Mediterranean was the outstanding event in the king's year, most of which was otherwise spent in or near London, in close contact with his ministers and in holding investitures. Twice in September the king dined with

KING GEORGE VI (right) enjoying the antics of comedians at a vaudeville show for the British home fleet in April 1943

the prime minister in Downing St., and in November he entertained the visiting regent of Iraq for two days at Buckingham palace. His gift of a jewelled sword of honour in token of British "homage to the steel-hearted citizens of Stalingrad" followed an exchange of messages with President Kalinin of the U.S.S.R., after the great victory there in February. On the fourth anniversary of the war the king ordained a national day of prayer on September 3 and on September 12 a day of thanksgiving for the unconditional surrender of Italy.

The king's only previous visit to the front was in Dec. 1939, when the British army was still in France. The African journey, lasting a fortnight, began on June 11, 1943, and was made in a four-engined bomber, piloted by Group Captain Fielden. With the king were the secretaries of state for war (Sir James Grigg) and air (Sir Archibald Sinclair). Reaching Algiers on June 12 the king was received by General Dwight Eisenhower, Allied commander-in-chief, General Sir Harold Alexander, commander in the field, Harold Macmillan, resident minister, and Robert Murphy, President Roosevelt's personal representative. June 14 was spent with General Mark Clark's 5th American army. On June 16, attended by Admiral Sir Andrew Cunningham, Allied naval commander-in-chief, the king visited the Allied fleet, boarding, among other vessels, a U.S. battleship to be received by Vice Admiral Hewitt, U.S.N. Back in Africa the king, on June 17, saw a U.S. air headquarters and the 1st British army under General Kenneth A. N. Anderson. In Tunis on June 18 he visited General Louis Jacques Barré of the Free French and General Bernard L. Montgomery's 8th British army. Next day on the cruiser "Aurora" he reached Malta to tour war-scarred Valletta with the governor, Viscount Gort, and the council. June 21 was spent in Tripoli. Before returning to England, reached on June 25, the king invested General Eisenhower with the G.C.B., knighted Generals Montgomery and Henry Maitland Wilson (commanding in the near East) and instituted the Africa Star and the 1939–1943 Star, for hard fighting on all fronts. (L. Du.)

George of Bavaria, Prince (1880–1943) was born April 2, the grandson of Emperor Franz Josef of Austria-Hungary and eldest son of Prince Leopold of Bavaria. In 1912, amid regal pomp and splendour, he was married at the Schoenbrunn palace to the Archduchess Isabelle Marie of Austria. The alliance was not a happy one, however, and the marriage was annulled a year later. In 1919, Prince George entered a Jesuit monastery at Innsbruck, was ordained in 1921 and subsequently became dean of the chapter of St. Peter. His death, according to a Berlin radio broadcast of June 1, was announced by the Vatican.

Georgia. A southern state, one of the original states of the United States; popularly known as the "Empire State of the South." Area 58,876 sq.mi. (including 358 sq.mi. of inland water); pop. (1940) 3,123,723; urban 1,073,808 (34.4%); rural 2,049,915 (65.6%); native white 2,026,362 (64.9%); Negro 1,084,927 (34.7%); foreign born white 11,916 (.4%); other races 518. Capital, Atlanta (302,288); the next largest cities are Savannah (95,996), Augusta (65,919), Macon (57,865).

History.—Ellis G. Arnall was inaugurated governor on Jan. 12, 1943. The general assembly was in regular session from Jan. 11 to March 18. Among the many important legislative reforms enacted in this session were: a reorganization of the board of regents of the university system to provide for appointment of the members of the board by the governor subject to senate approval, to remove the governor from membership on the board and to secure a restoration of the accredited rating of the state's university system; the proposal as a constitutional amendment of a retirement plan for the state's 23,500 teachers; abolition of the power of the governor to grant pardons and paroles and the vesting of this power in a three-man commission; abolition of the system of allocating all incomes from certain taxes and fees to certain departments; requirement that physicians test expectant mothers for venereal disease; provision for the election of the state auditor by the legislature (previously he had been appointed by the governor); placing the state on Central War Time (some localities refused to adopt the change and remained on Eastern War Time).

On Aug. 3, 1943, these actions and proposals of the general assembly, among others, were ratified as constitutional amendments in a special election: reorganization of the board of regents; establishment of the Pardon and Parole board; teachers' retirement act; reduction of the legal age of voting in state and national elections from 21 to 18; authorization of the appointment of an interim commission to draft a new constitution for presentation to the general assembly (to meet in Jan. 1945) for approval and submission to the people; exemption of out-of-state subsidiaries of Georgia corporations from the state's ad valorem and intangible taxes; granting all war veterans uniform civil service preference in state and local government jobs coming under merit employment systems.

An extra session of the general assembly met Sept. 27 to Oct. 1, 1943 to enact prison reform measures. The session abolished the state Board of Prisons and created the office of director of corrections. The three-man Board of Prisons was retained in an advisory capacity until Jan. 1. Gov. Arnall appointed Wiley Moore director of corrections, without pay, to reorganize the penal system.

Chief state officers for 1943 were: governor, Ellis Arnall; attorney-general, T. Grady Head; secretary of state, John B. Wilson; treasurer, George B. Hamilton; comptroller general, Homer Parker; chief justice, Charles S. Reid; superintendent of schools, M. D. Collins.

Education.—There were 3,727 elementary schools in Georgia and 1,494 schools having high school grades, according to figures released in 1942. Enrolment (1942–43) was: elementary schools 619,068 (374,875 white; 244,193, Negro); high schools 144,156 (117,298 white; 26,858 Negro). During the 1941–42 session there were 16,822 teachers in the elementary schools of Georgia (10,912 white; 5,910 Negro) and 5,957 in the secondary schools (5,067 white; 890 Negro).

Communication.—On Aug. 31, 1943, there were 99,074.96 mi. of highways in Georgia (13,995.02 state, 85,079.94 county). During the fiscal year ending June 30, 1943, total expenditures of state funds by the highway department amounted to $11,118,524.46 (including $2,666,790.93 paid to counties on refunding certificates and $8,451,733.53 for actual operations). As of Dec. 31, 1942, steam railways in Georgia owned 6,215 mi. of road (first main track).

Airports in the state included: municipal 30; commercial 5; intermediate 12. There were 276,519 telephones of the Southern Bell Co. and 28,268 independent telephones in operation as of Nov. 1, 1943.

Banking and Finance.—On June 30, 1943, there were 245 state banks in Georgia with deposits (exclusive of interbank deposits) amounting to $340,120,000; loans $97,728,000; investments $160,622,000. There were 47 national banks with deposits (exclusive of interbank deposits) amounting to $531,954,000; loans, $122,331,000; and investments, $352,433,000. Total state treasury income for the year ending June 30, 1943, amounted to $58,183,496.83; total payments from the treasury on appropriations amounted to $55,189,124.02. The fixed debt on June 30, 1943, stood at $19,759,784.03; the net fixed debt

as of that date was $14,081,790.93.

Agriculture.—Total value of agricultural production in Georgia for 1943 amounted to $368,930,000, the second highest in the state's history.

It was exceeded only by the record valuation of $578,000,000 in 1919.

Higher prices and increased production over 1942 accounted for the increase.

Table I.—*Leading Agricultural Products of Georgia, 1943 and 1942*

Crop	1943 (est.)	1942
Cotton, bales	850,000	855,000
Cottonseed, tons	379,000	382,000
Corn, bu.	45,288,000	30,160,000
Oats, bu.	10,120,000	10,152,000
Potatoes, sweet, bu.	9,375,000	8,000,000
Tobacco, lb.	65,004,000	59,710,000
Hay, tons	897,000	815,000
Peanuts, lb.	910,080,000	627,690,000
Velvet beans, tons	422,000	409,000
Peaches, bu.	1,593,000	6,177,000

Manufacturing.—No census of manufactures had been compiled since the federal census of 1939. There were, in 1939, 3,150 manufacturing establishments in Georgia that produced goods valued at $677,402,657, employed 170,165 persons and paid in salaries and wages $132,188,496.

Unemployment benefits paid from Jan. 1 to Dec. 20, 1943, amounted to $963,701.10.

Mineral Production.—Total value of mineral production for 1942 was $20,075,924 and for 1941, $21,049,261. (E. C. GR.)

Table II.—*Principal Mineral Products of Georgia, 1942 and 1941*

German Literature.

Literature is more inseparably linked with social and political history in Germany than is the case in any other country. This was particularly true of the latest period of national socialist totalitarian domination. All authors must be members of the nazi writers' association, must submit their books for approval to nazi authorities before they are printed, and must conform strictly to nazi ideology.

This situation, together with the fact that virtually all persons were forced into military service or war work, explains why few notable works of literature were being produced in Germany.

It was therefore to the refugees outside the reich that one looked for German literature today.

Many of them sought to explain the rise of national socialism in Germany or conditions there. Four of these were *The World of Yesterday,* an informal autobiography and cultural history of his times by Stefan Zweig; *The War for Man's Soul,* by Ernest Jaeckh, a liberal scholar and expert on Turkey who in 1920 founded the Hochschule fuer Politik in Berlin; *Flight from Terror,* by Otto Strasser and Michael Stern; and, in lighter vein, *Blood and Banquets,* by Bella Fromm, who gives a kind of social diary describing the celebrities whom she met at dinners and cocktail parties. *The Other Germany,* by Heinrich Fraenkel, attempts to demonstrate the existence of a large liberal anti-nazi population in Germany who are ready to co-operate in establishing democratic government. *The Passing of the European Age,* by Eric Fischer, an Austrian refugee, is an interesting and scholarly study of civilization at the centre and at the periphery, that is, of the transfer of European culture by emigrants to colonial lands, its development under new frontier conditions, and its later reflex influence upon the mother-countries from which the emigrants came.

Notable in fiction are two short novels contributed by Thomas Mann and Franz Werfel to *The Ten Commandments,* a collection of ten short stories edited by Armin L. Robinson which reflect on the nazi disregard of the Mosaic law.

The *Frankfurter Zeitung,* founded in 1856, one of Germany's oldest and most distinguished newspapers, known for its able financial and literary articles, was compelled to suspend publication on Sept. 1, 1943. *The Rise and Fall of the House of Ullstein,* by Herman Ullstein, tells well the half-century story of another of Germany's greatest newspaper and publishing businesses. (S. B. F.)

Germany.

A totalitarian state or dictatorship, known as the "third reich," in central Europe south of the North and Baltic seas and north of the Alps, Italy and the Balkans. Flag, black hooked cross (swastika) in a round white centre on a red background. Capital, Berlin (*q.v.*). Chief cities (1939 census): Berlin (4,338,767); Vienna (1,920,390); Hamburg (1,712,843); Munich (828,938); Cologne (769,437); Leipzig (707,578); Essen (667,004); Dresden (630,664); Breslau (630,041); Frankfurt-on-Main (553,462); Duesseldorf (541,625); Dortmund (539,682). Religion (1933): Protestants 62.7%; Catholics 32.5%; Jews 0.7%; others 4.1%. Reich chancellor and leader (fuehrer), Adolf Hitler (*q.v.*).

Area and Population.—The area of the old reich was 181,742 sq.mi.; population (census of May 17, 1939), 69,316,465. The area of "Greater Germany," prior to the annexations of 1939–42, was 225,199 sq.mi. and the population 79,364,408, including the populations of the following *Länder:* Prussia 41,684,788; Bavaria 8,224,541; Württemberg 2,898,888; Mecklenburg 900,589; Baden 2,503,225; Saxony 5,232,929; Thuringia 1,744,323; Hesse 1,468,468; Oldenburg 576,951; Brunswick 583,922; Anhalt 431,686; Lippe 187,281; Hamburg 1,712,843; Schaumburg-Lippe 53,277;

"BEGINNING TO HEAR THE BIRDIES SING." A cartoon of 1943 by Orr in the *Chicago Tribune*

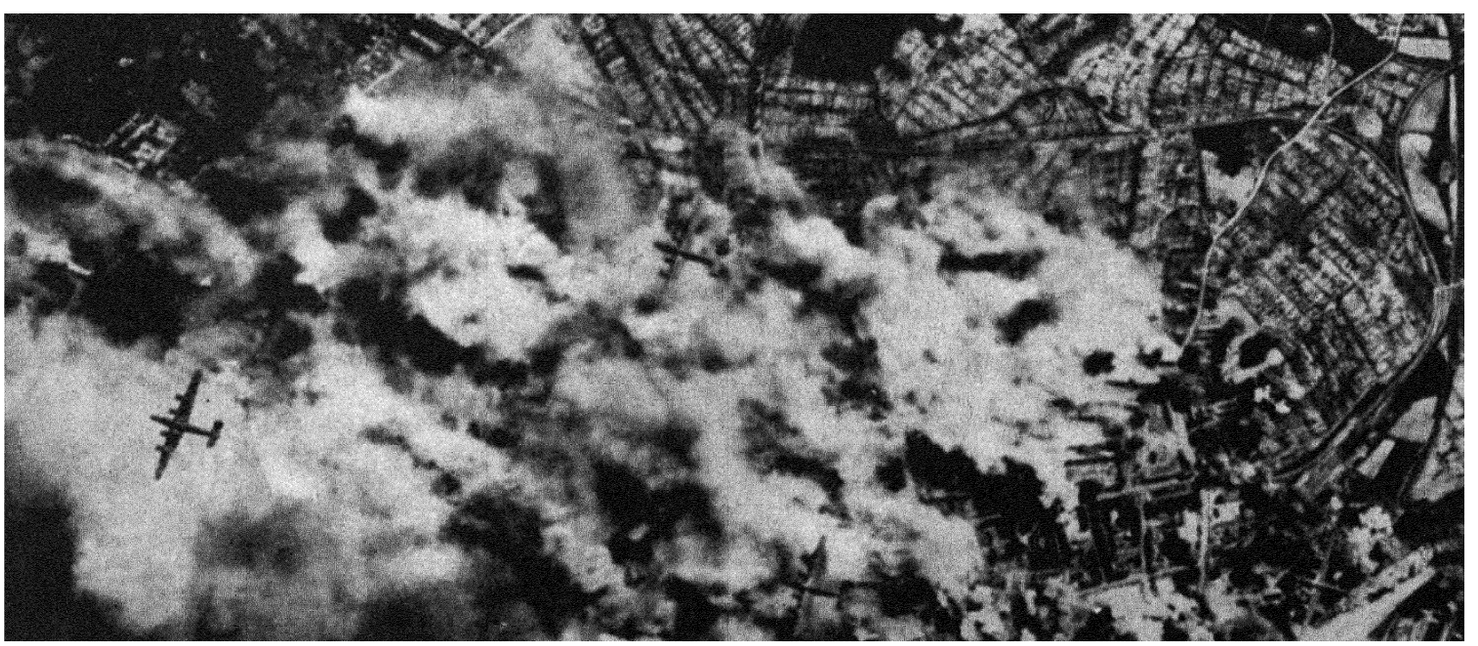
Bremen 413,759; Saarland 842,420; Austria 6,638,364; Sudetenland 2,944,279.

The population of "Greater Germany" in 1943 was approximately 98,582,000 as a result of the annexation during 1939–42 of the following territories: Bohemia-Moravia (6,805,000); Memel (153,000), Eupen-Malmédy (60,000); Polish lands (Danzig, Polish Corridor, Silesian border districts, totalling about 10,000,000); Alsace-Lorraine (1,900,000); and Luxembourg (301,000). This figure of 98,582,000, however, made no allowance for decreases in population caused by Germans killed in war, Poles expelled or killed, and Jews deported or exterminated, or for the increase from prisoners of war and imported foreign workers.

Outside "Greater Germany," Hitler also controlled millions of people in lands which were conquered and occupied by his armies, but which were not directly annexed to the reich: the Gouvernement General of Poland (15,000,000) under the administration of Hans Frank; Denmark (3,777,000); Norway (2,900,000); Netherlands (8,640,000); Belgium (8,386,000) and France (40,000,000), the northern three-fifths of which was "occupied" in June 1940, and the remainder in Nov. 1942, after the Anglo-American occupation of French North Africa. Alsace-Lorraine (1,900,000) was incorporated directly into the reich on Nov. 30, 1940. In addition, by the infiltration of German troops and secret agents, Germany gradually acquired domination over Slovakia (2,653,564) in 1939, and over Hungary (12,708,439), Rumania (19,934,000) and Bulgaria (6,078,000) in the winter of 1940–41. In April 1940 a blitzkrieg brought Yugoslavia (15,703,000) and Greece (7,109,000) under nazi domination. This brought the total population under German domination, both in "Greater Germany" and the occupied lands, to more than 240,000,000. Even this figure did not include the indeterminate population in the regions of the U.S.S.R. which Hitler conquered in 1941–42 but had lost in large part by the end of 1943.

History.—The chief events during 1943 were: the intense Allied bombing of German cities; the rolling back of the nazi armies in Africa, Italy and the U.S.S.R.; the failure of the German submarine campaign; and the increased resistance and sabotage in the conquered countries. All this led to a decline in German civilian morale and to a stiffer attitude toward Germany in the neutral countries of Sweden, Switzerland, Turkey and Portugal.

During 1943 giant British and U.S. bombers rained down about 150,000 tons of explosive and incendiary bombs on Germany's 21 largest industrial centres. As a result, in the eight months from April 1 to Dec. 5, according to German official figures, 124,630 persons were killed and 30,000 missing. The homes of 2,580,000 persons and the places of employment of 1,960,000 workers were destroyed. The casualties for the hardest-hit cities were: Hamburg 28,390; Berlin 16,639; Cologne 8,251; Dortmund 7,106; Hanover 6,518; Duesseldorf 6,207; Bochum 4,902; Wuppertal 4,632; Mannheim 4,367; Nürnberg 3,674; Frankfurt 3,486; Kassel 3,532.



These official German figures, however, were probably an understatement. Swedish and Swiss eyewitnesses and travellers gave much higher estimates. Also the German figures did not include the last four weeks of the year, when the raids were heaviest and most frequent, including further devastating blows on Berlin, Bremen, Leipzig, Frankfurt and Mannheim. Probably 6,000,000 people—nearly a tenth of Germany's prewar population—were driven from their homes and forced to seek shelter with others or to wander to less dangerous areas in eastern Germany or western Poland.

In carrying out these devastating mass raids the Allies had many aims in view: the direct destruction of factories engaged in war production; the disruption of the German transportation system; the weakening of German morale; and the general softening up of nazi strength preparatory to an Allied invasion of western Europe which would create the real "second front" for which the Russians had long been clamouring. How far these aims were achieved it is impossible to say definitely. Probably German production was slowed down as much as 20%. Transportation difficulties were greatly increased. The failure of the German submarine campaign was also partly a result of the blows at the German ports of Kiel, Hamburg, Bremen, Emden and elsewhere as well as to inland plants which fabricated submarine parts and machinery. The failure of the German luftwaffe to give adequate coverage on the eastern front and at the same time to prevent the raids on Germany from Britain and from the new Allied bases in Africa and Italy was partly due to the bombing of aircraft factories, synthetic gasoline plants and the Rumanian oil fields at Ploesti.

(For the various German campaigns of 1943, *see* WORLD WAR II.)

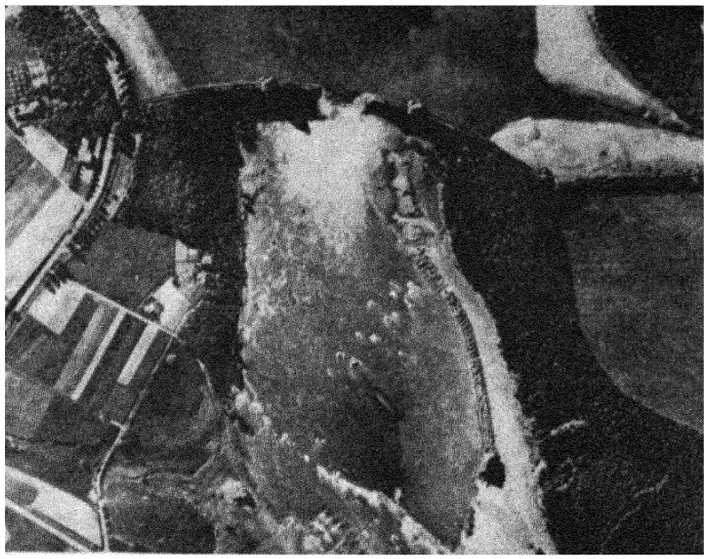
Education.—In the old reich in 1938 there were 51,118 public elementary schools (*grundschule*) with 7,596,437 pupils; 1,563

FOUR-MOTORED "LIBERATORS" of the U.S. army air force over the German naval base at Kiel May 14, 1943

THE HOLLOW RUINS OF DUESSELDORF, photographed after the 56th R.A.F. bombing of the German industrial centre on the night of June 11, 1943

elementary "middle schools" teaching English and French with 272,635 pupils; 2,282 secondary schools with 670,895 pupils; 10 technical high schools with 9,554 students; and 25 universities with 48,139 students. The nazis established many special schools for training "leaders," with emphasis on comradeship, sports, nazi ideology and leadership.

Defense.—After 1935 the German army was based on the principle of universal military training for two years, in addition to semimilitary training in the Hitler Youth (eight years) and Labour corps (six months). The army in 1943 consisted of more than 300 divisions of 12,000–14,000 men each if at full strength, but by Dec. 31 many divisions had become skeletal because of very heavy losses in the U.S.S.R., the Balkans, North Africa, Sicily and Italy. These probably amounted to more than 1,000,000 men in 1943, in addition to more than 700,000 killed and missing and 1,500,000 wounded earlier in the war.



In addition to the German armies, Hitler had had Italian, Rumanian, Hungarian and other troops fighting his battles, but these began to disintegrate or return home as the tide of war turned against Germany in 1943. The Italian army disintegrated completely after the collapse of the Mussolini regime in July, and many of the Falangist Blue division had returned to Spain by the end of 1943.

The navy in 1943 consisted of the 35,000-ton battleship "Tirpitz," two 26,000-ton battleships, two 10,000-ton pocket battleships, 11 cruisers, about 50 destroyers, probably 400 submarines and perhaps two incomplete aircraft carriers. Germany acquired in addition a few French naval units when she seized Toulon in Nov. 1942, and a few Italian naval units in the summer of 1943. The "Tirpitz," however, was reported badly damaged in a northern Norwegian fiord by three British midget submarines, and the 26,000-ton "Scharnhorst" was sunk in a naval battle in the Arctic circle on Dec. 26. Sixty German submarines were destroyed in the three months September-November, 1943. Submarine losses were heavy throughout the year owing to increased Allied air protection, aided by planes based on the Portuguese Azores and by the activity of Allied patrol boats. New submarine construction was seriously handicapped by intense Allied air raids on Hamburg, Bremen, Emden and other ports and on German industrial centres.

Total figures for the German air force were not available. But production of German planes, as a result of the bombing of the Messerschmitt plant at Wiener-Neustadt near Vienna, the ball-bearing factory at Schweinfurt and other factories, was believed to have been cut down to 2,500 planes a month by the end of 1943, while plane production in the United States alone soared to more than 8,000 a month. German plane production was insufficient to offset the heavy losses in Germany, the U.S.S.R. and Italy. Allied air superiority became evident as Germany was less and less able to meet the double task of protecting its eastern front and of stopping Allied mass raids on cities within the reich.

Finance.—The unit of currency is the German mark, nominally equivalent to 40.3325 U.S. cents. The Germans also issued special paper marks (*reichskassenscheine*) of varying value for use in the occupied territories. Revenues and expenditures had not been published since 1935. The total amount levied by Germany on the occupied countries of Europe up to Sept. 1943 was estimated at 42,800,000,000 marks and the annual rate in 1943 was 15,850,000,000 marks. In addition, the amount due to the occupied countries through Germany's blocked-mark system of not paying for imports was estimated in Sept. at 17,500,000,000 marks, and was increasing in 1943 at the annual rate of 6,700,000,000 marks. The reich debt at the end of 1943 was estimated at more than 200,000,000,000 marks, and the note circulation at 28,050,000,000 marks in Sept. 1943.

Trade and Communications.—As a result of the war, Germany was cut off from world trade and was confined to trade with the occupied countries in Europe and a few neutrals like

BREACH IN THE MOEHNE DAM, Germany, after British bombers dropped 1,500-lb. mines on and near the structure May 16, 1943. The Ruhr valley was flooded as a result of this raid

Sweden, Switzerland and Turkey.

Her prewar trade, for which alone figures were available in 1943, is given in Table I.

The German state railway (*reichsbahn*) in 1938 included 53,330 km. (33,076 mi.) of standard-gauge lines and 879 km. (546 mi.) of narrow-gauge lines. Privately owned lines included 3,732 km. (2,313 mi.) of standard and 752 km. (476 mi.) of narrow gauge. In spite of Germany's stripping the conquered territories of much of their rolling stock, the German railways during the war were put under a very heavy strain and in 1943 were in worse condition than in 1939. On the Russian front the Germans lost 700 locomotives and 17,000 freight cars in 1943, in addition to many locomotives and trains which were destroyed by Allied planes in western Europe. The bombing of the Moehne and Eder dams on May 16 disrupted the Ruhr area canal system and inundated Kassel, where Germany's most important locomotive works were located.

In 1938 there were 132,094 mi. of road in Germany, and by the middle of 1939, 2,264 mi. of the new concrete automobile highway network (*reichsautobahn*) were opened to traffic. This new highway had been partly designed for strategic purposes, but owing to lack of fuel for trucks was of little military value in 1943.

Agriculture, Manufactures and Mineral Production.—Germany's prewar agricultural and mineral productions are shown in Tables II and III.

Germany's harvests in 1943 were generally better than in 1941 and 1942. The wheat harvest, according to Herbert Backe, secretary of state for agriculture, would reach 4,200,000 metric tons, which, however, was less than the prewar average. The mirage of vast grain supplies from the Ukraine vanished as the nazis were swept west of the Dnieper river by Stalin's armies in the autumn of 1943. As the Germans continued to drain agricultural supplies from the other conquered territories the food situation did not become acute for the nazi "master race" in

Table I.—*Imports, Exports and Balance of Trade, 1932–39*

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balance Million marks

1938	8,463	5,502	4,177	6,274	48,700	17,200	41,700
1939	—	—	—	—	54,540	17,400	39,500

*Figures for 1939 are estimated. The total grain harvest was estimated at 27,430,000 metric tons, *i.e.*, 6.4% more than the total for 1938.

1943, though the subject populations suffered severely from inadequate rations or from lack of food of their own.

Manufactures were subjected to a still tighter strait jacket in 1943 in order to increase the production of war materials. Many small plants were closed and all factories had to manufacture exactly what they were told to make. War goods superseded consumers' goods even more completely than hitherto. By the end of 1943 new clothing, household utensils and new housing were almost unobtainable. After Sept. 8 complete control over all production was given to Albert Speer, the minister of munitions and armaments. This 39-year-old favourite architect of Hitler thus became "economic czar" for the duration of the war, with even more power than Hermann Goering.

Due to the recruiting of men from fields and factories for the army and to the demands for increased production caused by the war, and also to the greater amount of labour required to produce substitute (*ersatz*) instead of natural products, Germany suffered an increasingly severe labour shortage during 1943. This was partly met by employing more women and children, women being conscripted for work up to the age of 60. The labour shortage was also partly met by renewed efforts, not very successful, to induce more French, Italian and other foreign

Table III.—*Production of Minerals and Manufactured Products, 1933–37*
(In metric tons)

	1933	1934	1935	1936	1937

Steel	7,393,200	11,601,700	16,013,500	18,590,000	19,387,000

workers to accept employment in Germany. These "slave workers" often had no alternative except starvation, since the nazis closed down the home factories where they had been employed. The total number of war prisoners and foreign workers who were forced to work in Germany at the end of 1943 was estimated at more than 10,000,000.

These foreign workers included about 3,000,000 Russians, carefully guarded and feared by the Germans; 2,500,000 Frenchmen; 1,800,000 Poles, 1,000,000 Italians; 1,000,000 Czechs; 700,000 Belgians; and numerous Dutch, Scandinavians, Balts, and Balkan nationalities. They were housed separately, kept in control by the threat to withhold their meagre food rations, and carefully watched by armed German foremen and gestapo officials. During the frequent Allied bombings of industrial centres, in which factory records were destroyed, many of the slave workers managed to escape and return home secretly.

Giraud, Henri Honoré (1879–), French army officer, was born Jan. 18 in Paris and attended St. Cyr Military academy and the École Supérieure de Guerre. Early in World War I, he was wounded and captured by the Germans, but escaped in 1915 and returned to the front. Toward the end of the war he was chief of staff of a Moroccan division and he participated in the Riff campaign. After the German break-through at Sedan in May 1940, General Giraud took command of the Allied armies in northern France; but he was captured and interned in Koenigstein prison, Saxony. In April 1942, Giraud staged another daring prison break and escaped to Vichy via Switzerland. He then fled Vichy and offered his services to the U.S. armies at the start of the North African campaign. On Nov. 15, 1942, Admiral Darlan named Giraud commander of all French armed forces in North Africa. After Darlan's assassination, Giraud was named high commissioner of French North Africa, Dec. 27. In Jan. 1943, a bitter feud broke out between Giraud and Gen. Charles de Gaulle. On Feb. 6, Giraud assumed the title of French civil and military commander-in-chief in North Africa; the following month he formally severed all ties with Vichy and pledged restoration of free republican rule in France after the war. In the summer of 1943, Giraud's popularity ebbed. He had the backing of the U.S. state department and Great Britain, but the majority of Frenchmen in North Africa supported de Gaulle. Giraud finally invited his rival to Algiers and on June 3 a new governing body for France was created with Giraud and de Gaulle serving as co-presidents. Subsequently, Giraud lost ground to de Gaulle and on Nov. 9, 1943, the former resigned as co-president of the French Committee of National Liberation, but retained his post as commander-in-chief of French forces. (*See* also FRANCE.)

Girl Scouts. In 1943 the Girl Scouts worked closely with other organizations in order to bring the citizenship training of scouting to more of the girls who were asking for it. Protestant, Roman Catholic, and Jewish advisers or advisory committees were appointed to work with the Girl Scout national organization. A committee of leading educators and one representing the National Congress of Parents and Teachers were also appointed. The General Federation of Women's Clubs and the men's and women's civic clubs such as Rotary, International and Zonta worked out plans for closer co-operation.

Planning with the whole community to meet the needs of youth in wartime, Girl Scouts in many towns opened their day camps to all neighbourhood children who wished to come. Troops were organized in war workers' trailer camps and in mushrooming boom towns. By the end of 1943, the total membership was 817,000, an increase of 100,000 over 1942.

Girl Scouting put special emphasis on projects that would not only enable girls to contribute to the war effort but also prepare them for intelligent citizenship later. For example: Senior Girl Scout hospital aides helped to relieve the shortage of nurses by serving in children's wards, linen rooms, laboratories, and kitchens. Wing Scouting, founded in 1942, became the fastest growing section of the older girls' program and began to prepare many girls for future service in aviation.

Through the Juliette Low World Friendship fund (formerly the Juliette Low Memorial fund) aid was sent to the British Guides for their relief work, to the Guides of Malta, and to the children of Greece, Russia, and China. Foreign students were also given scholarships for training in Girl Scout leadership so that they might help to develop or re-establish Girl Scouting in their own countries. (C. M. R.)

Glands: *see* ENDOCRINOLOGY; MEDICINE.

Glass. The major effect of the war upon the U.S. glass industry in 1943 was the stimulation of production of bottles, jars and containers. The increased volume of these items became necessary because of the greater amount of food preservation, both commercial and domestic. The total value of glassware made in the U.S. exceeded $500,000,000, for the first time in history. Much more than half of this value came from bottles and containers, which replaced many articles formerly made from tin plate and other metals. The new record in production of these items exceeded 90,000,000 gross.

Plate glass, made chiefly for military purposes, showed a slightly higher production than in 1942, exceeding 65,000,000 sq.ft. Bullet-resistant glass, made by joining tempered sheets

TESTING IMPACT-RESISTANT GLASS for aeroplane windshields, developed by the Civil Aeronautics administration to prevent injury to pilots in mid-air collisions with birds. Freshly-killed chickens and turkeys are fired at the windshields at a velocity of 300 m.p.h.

with plastic intermediate layers, bent into suitable curvatures, was successfully installed in the noses and cockpits of military planes. Data on window glass were not available, but the quantity made was relatively small on account of so little new construction.

The production of optical glass and the manufacture of lenses and prisms continued at unprecedented rates. Research developed new techniques for the heat-treatment of optical glass.

Operating conditions continued to be difficult on account of labour shortage, lack of kraft paper for shipping cartons and more severe restrictions upon raw materials, including nitrates.

Tiny insulators and other small parts hitherto not readily fabricated from glass were produced by the Corning Glass Works by a new process. In this method, powdered glass is mixed with a binder, high pressure is applied, and subsequent heating welds the glass particles together and drives off the volatile binder. A new development in the fibre glass field consisted in reinforcing plastic sheets with matted glass fibres so that they developed tensile strengths as high as 80,000 lb. per sq.in. Precision gauges made entirely of glass were found superior to metal gauges in permanent accuracy and low cost. Glass piping and other forms were successfully welded electrically.

The Federal Trade commission ordered that the word "glass" could not be used as part of the trade names of certain products made of organic plastics. (S. R. S.)

Glassford, William Alexander, II (1886–), U.S. naval officer, was born June 6 in San Francisco. He was graduated from the U.S. Naval academy in 1906 and during World War I, he was a gunnery officer on a destroyer and later an executive officer on a destroyer tender. He won the D.S.M. for bringing the destroyer Shaw, of which he was commander, safely into port after a collision with a British vessel. During the period from 1924 to 1935, he was assistant director of naval communications, staff member of the Naval War college, commander of the battle force and commander-in-chief of the U.S. fleet. After Japan attacked Pearl Harbor, Glassford, who was commander of the Yangtze patrol, was placed at the head of the newly organized Southwest Pacific naval command, Feb. 1942. Later that month, he participated with the Dutch fleet in the battle of the Java sea. He was then given the post of commandant of the sixth naval district and Charleston navy yard. On May 24, 1943, President Roosevelt nominated him for promotion to vice-admiral; two days later, Adm. Glassford, who had been decorated for negotiating the agreement whereby French authorities opened Dakar to U.S. naval forces, was made President Roosevelt's personal representative, with the rank of minister, to French West Africa.

Gliding. On July 9, 1943, in the invasion of Sicily, the U.S. army used gliders for the first time as a major tactical weapon. The success of this venture was reflected in renewed orders for 15 place transport gliders, and orders for still larger transport gliders.

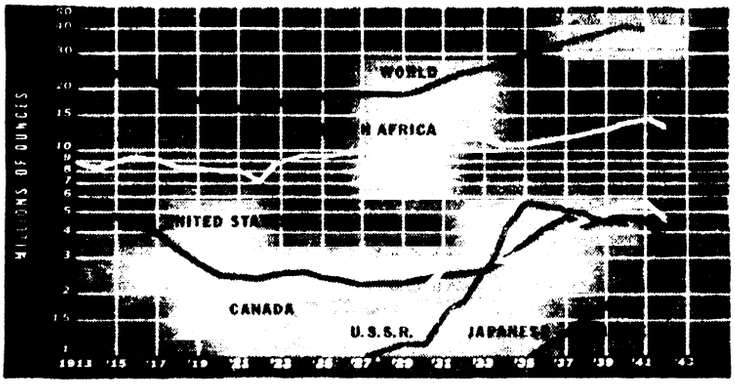
In 1943, two of the most outstanding personalities in the field of gliding lost their lives in the service of the nation. On January 24 Major Lewin B. Barringer, chief of the glider section of the army air forces, was lost on a routine flight over the sea. In the capacity of special civilian assistant to the commanding general of the army air forces, Richard C. du Pont was killed while testing a giant transport glider on Sept. 11.

Prior to the war, Mr. du Pont as president and director, and Major Barringer as manager and director of the Soaring Society of America, were largely responsible for the existence of the nucleus of trained glider pilots with which the army started its glider program.

Civilian gliding activities included:

The establishment of a new national altitude record of 19,434 ft. above point of release for single place gliders, by Capt. J. Shelly Charles at Atlanta, Georgia on July 18.

Two new Civil Aeronautics administration approved, single place, all wood training glider designs, suitable for the high school gliding program. They are the "Denver Pioneer" by the University of Denver and the "Cadet" by Cadet Aeronautics, Inc.



A major soaring contest was held at Bishop, Calif. on Sept. 4, 5 and 6 under the sanction of the Soaring Society of America. (B. Sk.)

Glyn, Elinor (1864–1943), British author, was born Oct. 17 in Jersey, the Channel islands. Daughter of a British civil engineer, she married in 1892 and wrote a few novels to bolster the family finances. Her early works, lightly garnished with sentiment and romance, were "reliable" light reading. But in 1906, Mrs. Glyn, determined to make romance pay, created *Three Weeks*, written in six weeks. Published in 1907, this novel was an immediate success, but it was considered "shocking" by ecclesiasts and lay authorities and was banned for a time in Britain and the United States. During the 1920s, Mrs. Glyn was regarded as a daring "love analyst." She went to Hollywood, where she advised silent screen directors on love scenes. In 1927, she published another best-seller, *It*. Although it was frequently asserted that Mrs. Glyn glamourized the pronoun "it" and made it synonymous with sex appeal, Mrs. Glyn herself modestly declined to accept this honour. Her later works included *The Flirt and the Flapper* (1930) and *Romantic Adventure* (1936). Mrs. Glyn died in London, Sept. 23.

G-Men: *see* FEDERAL BUREAU OF INVESTIGATION.

Goering, Hermann Wilhelm (1893–), German reichsmarshal and statesman, was born at Rosenheim, Bavaria, on Jan. 12 and was commander of the famed Richthofen squadron in the German air force during World War I after Richthofen's death. Goering was an early member of the nazi party and became air minister and minister of the interior in 1933 upon Hitler's accession to the chancellorship. (See *Encyclopædia Britannica.*) On July 19, 1940 Hitler conferred the newly created title of marshal of the reich on Goering. As head of the economics general staff, he had supreme control over Germany's economic life. Goering was generally regarded as second man in Germany during World War II. His prediction in 1941 that the luftwaffe could do one hundred to one thousand times more damage than the R.A.F. was a sorry one, but his position as leader remained intact. Late in 1942 he told his countrymen, fearful of another Russian winter campaign, that they would be fed if necessary at the expense of conquered nations. On April 20, 1943, Hitler's 54th birthday, Goering proclaimed that the issue of the war had become one of "victory or destruction." In August, following meetings at Adolf Hitler's headquarters, it was reported that Goering had been given still further powers "of enormous magnitude."

Gold. With respect to gold, the year 1943 was conspicuous chiefly for an acceleration of two major trends which had set in during 1942. These were: (1) a reversal of the steady rise in world gold production which, until 1942, had endured for 19 years (see *Production*, below), and (2) a turning of the tide in the most spectacular international gold movement in history—the so-called "flight to the dollar," which between 1933 and 1941 produced a rise in U.S. holdings of monetary gold from roughly

GOLD PRODUCTION: world total and output of the principal producing countries, as compiled by *The Mineral Industry*

$4,000,000,000 to almost $23,000,000,000.

In some ways even more striking than the decline in world gold output was the change in direction of the world gold movement. Whereas 1942 represented the ending of the flood tide of gold to the United States, 1943 brought a real ebb tide in this movement. As seen in Table I, in the first ten months of 1943, gold stocks declined by more than $610,000,000, which was far and away the largest loss by the United States in its history.

Table I.—*Analysis of Changes In Gold Stock of the United States*

*Figures based on rate of $20.67 a fine ounce in Jan., 1934, and $35 a fine ounce thereafter.
†Includes gold in the inactive account.
‡Net gold import figures have not been released for months subsequent to Dec. 1941.
§Gold under earmark at Federal Reserve banks for foreign account amounted to $3,346.3 millions on Oct. 30, 1943.
‖Preliminary.

For the most part this "loss" of gold was not a physical loss. As a matter of fact, the U.S. showed a net import balance of about $22,000,000 on the actual movement of gold into and out of the country. The decline in gold stocks was the direct result of gold earmarking in the U.S. for foreign account. Aside from its lend-lease activities, the foreign trade of the United States showed an "unfavourable" balance in 1943, chiefly because countries (particularly in Latin America) were unable to offset their exports to the United States with merchandise which they ordinarily would have imported. This enabled them to build up large bank balances in the United States.

Wherever free markets existed for gold in 1943 it sold at a premium, that premium ranging from 10% in the case of Latin American countries to as much as 100% in inflation-ridden India and Egypt, where the governments resorted to official sales of the metal to the public as a means of absorbing excess purchasing power. And finally there was the fact that the nation which was the chief advocate of managed exchanges—Germany—stood in the shadow of military defeat, while the three major powers among the United Nations—Great Britain, U.S.S.R. and the United States—were the three powers which had the largest stakes in the perpetuation of gold, in one form or another, as the basic money of international exchange. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES; FEDERAL RESERVE SYSTEM.)

(E. H. Co.)

Production.—There was a very definite decline in world production of gold in 1942, amounting to about 11% as compared with 1941. While the available data were still so incomplete in 1943 that no very accurate estimate could be made of the total, it was probably around 35,000,000 or 36,000,000 oz. Declines were registered for every country for which comparable data were received covering 1941 and 1942.

Some of the more important decreases, in order of decreasing size, were: United States, 27%; Canada, 10%; Australia, 23%; South Africa, 2%; Colombia, 9%; Southern Rhodesia, 4%. The decreases in most cases were due to shortage of manpower, which was needed more for other metals than for gold.

Table II.—*Value of Gold Produced, 1900-43*
(In millions of old dollars, $20.67 an oz.)

Year	South Africa	Russia	Canada	U.S.A.	Australia	All others	Total

*Exclusive of Philippines.
†Exclusive of Russia, for which no official figures are available later than 1941.
‡Estimated.

Mine production of gold in the continental United States dropped from 4,750,865 oz. in 1941 to 3,457,110 oz. in 1942, a decline of 27%, the result of a shift of manpower to work of greater strategic importance or better pay; also in Oct. 1942 the War Production board ruling closed all primary gold mines, so that most of the gold produced in the last quarter of 1942 and in 1943 was a by-product of operations carried on primarily for nonferrous metals. As a result, the only important producing state to show an increase in output was Utah. The percentages of decline in the major producing states, in decreasing order of actual output, were as follows: California, 40%; Alaska 26%; Colorado, 28%; Montana, 41%; South Dakota, 13%; Nevada, 19%; Arizona, 22%; Idaho, 39%; and Oregon, 51%.

Nothing whatever was known of the status of gold production in the Philippine Islands after Japanese occupation, but mint and refinery receipts in the United States in 1942 dropped to 140,330 oz., as compared with 1,130,933 oz. in 1941.

The decline in United States output was even more pronounced in 1943 than in 1942. The total for the first three quarters of the year was 1,165,000 oz., with about 1,465,000 oz. expected for the year's total—a decline of 58% from 1942 and 69% from 1941. There was an almost continuous decline in output throughout 1943, the trend of which is best shown by the following daily average outputs in fine ounces for the periods indicated:

U.S. Daily Average Output

Year 1941	13,016	May	3,908
January 1942	10,168	June	3,772
Year 1942	9,590	July	3,493
January 1943	4,315	August	3,355
February	3,979	September	3,133
March	4,217	October	3,516
April	4,529		

Canadian production declined from 5,345,179 oz. in 1941 to 4,841,306 oz. in 1942. In Quebec and Saskatchewan, increases in by-product gold from copper and other nonferrous ores more than offset declines in primary gold output, but in most of the other provinces there were declines in output. During the first three quarters of 1943, the output totalled 2,842,122 oz., as compared with 3,727,457 oz. in the same period of 1942, a decline of 24%, against a drop of less than 10% in 1942 as compared with 1941.

The South African output showed a comparatively small decline in 1942, standing at 14,120,617 oz., as compared with 14,386,361 oz. in 1941. The production rate declined still further in 1943, equivalent to 12,850,000 oz. as estimated from the returns of the first three quarters, which totalled 9,637,000 oz.

After the United States and Canada, the next largest decline was in Australia, from 1,570,000 oz. in 1941 to 1,180,000 oz. in 1942. Production during the first half of 1943 averaged only about 72,000 oz. monthly, against 98,000 oz. in 1942.

The 1942 decline in Southern Rhodesia was 30,000 oz. to 760,000 oz. and with returns for nine months of 1943 at 500,000 oz. and dropping almost every month, the 1943 total was likely to be about 100,000 oz. less than that of 1942. India also had a 30,000-oz. drop in 1942, to 257,000 oz., and returns of 192,000 oz. for the first nine months of 1942 were at about the same rate. Gold Coast declined 100,000 oz. in 1942, to an estimated 785,000 oz.; specific figures were not at hand for 1943 at the end of that year, but apparently the decline continued. The 1942 output in Mexico was little different from the 800,000 oz. in 1941. In 1942 Colombia dropped about 50,000 oz. below the 656,000 reported in 1941, and with returns of 438,000 oz. through Sept. 1943, apparently showed another decline for the year. (*See* also MINERAL AND METAL PRODUCTION AND PRICES.)

(G. A. Ro.)

Gold Coast: *see* BRITISH WEST AFRICA.

Golf. It is a significant fact, that, of the 12 players whose names were inscribed as winners of the U.S. Amateur Championship over a period of 15 years, from 1927 through 1941, 10 were in uniform by 1943. So were hundreds of other golfers less well-known. Among professional ranks, approximately 20% of the Professional Golfers' association membership were giving military service.

Meantime, golfing organizations turned their attention almost entirely to the support of war work. The United States Golf association continued on a definite program of encouraging members' clubs to carry on organized support of fund-raising programs for patriotic purposes and the sale of war bonds. Special tournaments on national holiday dates were a part of the program. The association also sponsored the growing of victory gardens by club members on club property. It urged member clubs to give preference to disabled ex-service men, when employing new help.

The Professional Golfers' association arranged benefit matches and collected funds for service benefits in all tournaments played. Most notable among these was a team match at the Plum Hollow club of Detroit, in which the war-orphaned Ryder Cup team captained by Craig Wood defeated a team captained by Walter Hagen. The sum of $36,000 was realized. This went to purchasing golf equipment for American forces on the far-flung battle fronts.

Club tournaments continued on a greatly reduced schedule, with a few district and state championships. All of course missed the presence of popular favorites now in service. Among professional ranks, more "name" players were available even with such notables as Sam Snead, Ben Hogan, Horton Smith Jimmy Thompson, Paul Runyan, Victor Ghezzi, E. J. "Dutch" Harrison, Clayton Heafner, Jim Turnesa and others in uniform A few competitive events of interest were staged, notably in the middle west.

The Tam O'Shanter Country club of Chicago was the scene of one such event in which there were competitions for amateurs, women and an open contest. Harold "Jug" McSpaden emerged as the winner of the open tournament. At the end of 72 holes of play he was tied with William "Buck" White, competing in his first big tournament, at 282. In the play-off McSpaden won with a card of 71 against White's 72.

Dale Morey of Martinsville, Ind., former captain of Louisiana State university team, won the amateur event, defeating Robert Cochran of St. Louis 4 and 3. Miss Patty Berg of Minneapolis, former U.S. Women's champion, won the event for women, with a total of 307 for 72 holes of play. Miss Elizabeth Hicks of California was runner-up with 312. Miss Hicks wears the uniform of the SPARS. Miss Berg was sworn in as a member of the Marines the day after she won. Earlier in the year she had won the Women's Western Open title, defeating Miss Dorothy Kirby of Atlanta in the final match. This was Miss Berg's first tournament appearance following an injury to a knee sustained in an automobile accident 18 months earlier.

The Golden Valley Country club of Minneapolis was the scene of a round-robin team match, involving eight teams of well-known professionals. Craig Wood and Jimmy Demaret proved the winning combination, finishing the 126 holes of play with a total of plus 12. Next in line were Byron Nelson and Harold McSpaden scoring plus 9. The latter pair led from the first round through the sixth and were again leading at the end of nine holes of the last round. On the last nine they were the victims of great golf by Willie Goggin and Tony Penna, who beat par on six of the nine holes, winning four of the six.

Wallace Ulrich of Carleton college won the individual intercollegiate title from 74 other college golfers who competed at the Olympia Fields Country club near Chicago, defeating William Roden of the University of Texas in the final match by 4 and 2. Team honors went to Yale university with a score of 614 for a four-man team over 18 holes. Michigan was second with 618.

The year saw the passing of a notable figure in golf, Ted Ray, famous British professional, who won the United States Open championship in 1920. Twice a visitor to the U.S., Ray was a familiar figure to golfers. He first came into prominence in 1913, when he and his compatriot, Harry Vardon, finished in a tie for the U.S. Open at Brookline, Mass., only to be beaten by Ouimet in the play-off. A giant of a man, he was known in his heyday as one of the longest hitters in golf. (I. Bn.)

Golikov, Filip Ivanovich (1900–), Russian army officer, joined the Red army in 1918. An able tactician, his talents were recognized and he was awarded a military scholarship to the famous Frunze Military academy. One of the young generals of the soviet union, he was rapidly promoted and was made deputy chief of the general staff. Regarded as one of Russia's principal tank experts, he was decorated for his work in the Russo-Finnish campaign, 1939–40, which provided him with an opportunity to test his theories on mechanized warfare. In July 1941, he left the soviet union to lead a military mission to Great Britain. Following these conferences, he visited the United States to discuss lend-lease arrangements. The end of 1941 found him back in the field of operations, leading one of the seven armies which turned back the nazi tide during the titanic battle before Moscow in the winter of 1941–42.

At the beginning of 1943, Stalin promoted Golikov from army commander to commander of the Voronezh front in the Ukraine. He led the forces that recaptured Kursk, Rostov and Kharkov, in Feb. 1943.

Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Jan. 1, 1944.

Department or Bureau	*Name*	*Post*
Department of State	*Hull, Cordell	Secretary
	*Stettinius, Edward R., Jr.	Under-Sec'y
Department of the Treasury	Morgenthau, Henry, Jr.	Secretary
	Bell, Daniel W.	Under-Sec'y
Bureau of Comptroller of Currency	Delano, Preston	Comptroller
Treasurer of the U.S.	Julian, William A.	Treasurer
Bureau of Customs	Johnson, W. R.	Commissioner
Bureau of Internal Revenue	Hannegan, Robert E.	Commissioner
War Department	*Stimson, Henry L.	Secretary
	*Patterson, Robert P.	Under-Sec'y
General Staff	*Marshall, George C., Gen.	Chief of Staff
Army Service Forces	*Somervell, Brehon, Lt. Gen.	Comm'd'g Gen.
Army Ground Forces	*McNair, Lesley J., Lt. Gen.	Comm'd'g Gen.
Army Air Forces	*Arnold, Henry H., Gen.	Comm'd'g Gen.
Department of Justice	Biddle, Francis	Att'y-Gen.
Solicitor General	Fahy, Charles	Solic. Gen.
*Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
Immigration and Naturalization Service	Harrison, Earl G.	Commissioner
*Post Office Department	Walker, Frank C.	Postm'r Gen.
Department of the Navy	*Knox, Franklin	Secretary
	Forrestal, James V.	Under-Sec'y
Office of Commander in Chief, U.S. Fleet, and Chief of Naval Operations	*King, Ernest J., Adm.	Commander in Chief, U.S. Fleet, and Chief of Naval Operations
Bureau of Naval Personnel	Jacobs, Randall, Rear Adm.	Chief
Bureau of Ordnance	Hussey, George F., Jr., Rear Adm.	Chief
*U S. Marine Corps Headquarters	*Vandegrift, Alexander A., Lieutenant Gen.	Commandant
*U.S. Coast Guard	Waesche, Russell R., Vice Adm.	Commandant
Department of the Interior	Ickes, Harold L.	Secretary
	Fortas, Abe[1]	Under-Sec'y
General Land Office	Johnson, Fred W.	Commissioner
Office of Indian Affairs	Collier, John	Commissioner
Solid Fuels Administration for War	Ickes, Harold L.	Administrator
Office of Fishery Coordination	Ickes, Harold L.	Fishery Coordinator
Geological Survey	Wrather, William E.	Director
*Fish and Wildlife Service	Gabrielson, Ira N.	Director
Bureau of Reclamation	Bashore, Harry W.	Commissioner
National Park Service	Drury, Newton B.	Director
Bureau of Mines	Sayers, Royd R.	Director
Division of Territories and Island Possessions	Thoron, Benjamin W.	Director
Department of Agriculture	*Wickard, Claude R.	Secretary
	Appleby, Paul H.	Under-Sec'y
*Agricultural Research Administration	Auchter, E. C.	Administrator
Bureau of Animal Industry	Miller, Arthur W.	Chief
Bureau of Agricultural and Industrial Chemistry	Skinner, W. W.	Acting Chief
Bureau of Dairy Industry	Reed, Ollie E.	Chief
Bureau of Entomology and Plant Quarantine	Annand, P. N.	Chief
Office of Experiment Stations	Jardine, James T.	Chief
Bureau of Plant Industry, Soils, and Agricultural Engineering	Salter, R. M.	Chief
Bureau of Human Nutrition and Home Economics	Sherman, Henry C.	Chief
Bureau of Agricultural Economics	Tolley, Howard R.	Chief
War Meat Board	Reed, Harry E.	Chairman
*War Food Administration	*Jones, Marvin	Administrator
Commodity Credit Corporation	Hutson, J. B.	President
Food Distribution Administration	Hendrickson, Roy F.	Director
Agricultural Extension Service	Wilson, M. L.	Director
Office of Labor	Bruton, Philip G., Col.	Director
Food Production Administration	Hutson, J. B.	Director
Agricultural Adjustment Agency	Dodd, N. E.	Chief
Soil Conservation Service	Bennett, Hugh H.	Chief
Federal Crop Insurance Corporation	Wright, J. Carl	Acting Manager
Farm Security Administration	Hancock, Frank	Chief
*Farm Credit Administration	Black, Albert G.	Governor
Forest Service	Lyle, F. Watts	Chief
Office of Foreign Agricultural Relations	Wheeler, L. A.	Director
Rural Electrification Administration	Slattery, Harry	Administrator
Department of Commerce	*Jones, Jesse H.	Secretary
	Taylor, Wayne C.	Under-Sec'y
Bureau of the Census	Capt, James C.	Director
Bureau of Foreign and Domestic Commerce	Taylor, Amos E.	Director
*National Bureau of Standards	Briggs, Lyman J.	Director
*Coast and Geodetic Survey	Colbert, Leo O.	Director
Civil Aeronautics Board	Pogue, L. Welch	Chairman
*Reconstruction Finance Corporation	Henderson, Charles B.	Chairman
War Damage Corporation	Clayton, W. L.	President
Patent Office	Coe, Conway P.	Commissioner
Weather Bureau	Reichelderfer, F. W.	Chief
Department of Labor	Perkins, Frances	Secretary
	Tracy, D. W.	Asst. Sec'y
U.S. Conciliation Service	Steelman, J. R.	Director
Bureau of Labor Statistics	Hinrichs, A. F.	Acting Commissioner
Children's Bureau	Lenroot, Katharine F.	Chief
Women's Bureau	Anderson, Mary	Chief
Wage and Hour and Public Contracts Divisions	Walling, L. Metcalfe	Administrator
*Federal Security Agency	*McNutt, Paul V.	Administrator
Office of Education	Studebaker, John W.	Commissioner
Public Health Service	Parran, Dr. Thomas	Surgeon Gen.
Social Security Board	Altmeyer, Arthur J.	Chairman
Food and Drug Administration	Campbell, W. G.	Commissioner
Office of Community War Services	McCloskey, Mark A.	Director
*Federal Works Agency	Fleming, Philip B., Major Gen.	Administrator
Public Buildings Administration	Reynolds, W. E.	Commissioner
Public Roads Administration	MacDonald, Thomas H.	Commissioner
War Public Works	Snyder, Baird	Director
War Public Services	Kerr, Mrs. Florence	Director
Independent Offices		
*Federal Communications Commission	Fly, James L.	Chairman
*Federal Deposit Insurance Corporation	*Crowley, Leo T.	Chairman
*Federal Power Commission	Olds, Leland	Chairman
*Federal Reserve System, Board of Governors of the	Eccles, Marriner S.	Chairman
*Federal Trade Commission	Freer, Robert E.	Chairman
*Government Printing Office	Giegengack, A. E.	Public Printer
*Interstate Commerce Commission	Patterson, Wm. J.	Chairman
Library of Congress	MacLeish, Archibald	Librarian of Congress
National Advisory Committee for Aeronautics	Hunsaker, Dr. Jerome C.	Chairman
National Capital Park and Planning Commission	Grant, U. S., III, Major Gen.	Chairman

[1]Discharged from the navy, Dec. 13, 1943. Renominated by Pres. Roosevelt.
[2]Appointed Jan. 8, 1944.

Great Britain.—The following were His Majesty's chief officers of state and the permanent officials of the more important of the government departments of Great Britain at the close of 1943:

Ministry or Department	Name	Post
Admiralty, The Board of	A. V. Alexander	First Lord
	Sir Henry V. Markham	Permanent Secretary
Agriculture and Fisheries, Ministry of	R. S. Hudson	Minister
	Sir Donald Fergusson	Permanent Secretary
Aircraft Production	Sir Stafford Cripps	Minister
	Sir Harold Scott	Permanent Secretary
Air Ministry	*Sir Archibald Sinclair	Secretary of State
	Sir Arthur Street	Perm'nt Under-sec'y
Assistance Board	Lord Soulbury	Chairman
	Sir George T. Reid	Secretary
Burma Office	L. S. Amery	Secretary of State
	Sir David T. Monteath	Perm'nt Under-sec'y
Cabinet Office	Sir Edward Bridges	Perm'nt Sec'y and Sec'y of the War Cabinet
Civil Service Commission	A. P. Waterfield	1st Commissioner
Colonial Office	*Oliver Stanley	Secretary of State
	Sir George Gater	Perm'nt Under-sec'y
Commissioners of Crown Lands	The Minister of Agriculture and Fisheries (*ex-officio*)	Commissioner
	O. S. Cleverly	Perm'nt Commissioner
Crown Agents for the Colonies	J. A. Calder H. F. Downie	Crown Agents
Customs and Excise, Board of	Sir Archibald Carter	Chairman
Dominions Office	Viscount Cranborne	Secretary of State
	Sir Eric Machtig	Perm'nt Under-sec'y
Duchy of Lancaster	Ernest Brown	Chancellor
Economic Warfare, Ministry of	Earl of Selborne	Minister
	Earl of Drogheda	Director-General
Education, Board of	R. A. Butler	President
	Sir Maurice Holmes	Permanent Secretary
Food, Ministry of	Col. J. J. Llewellin	Minister
	Sir Henry L. French	Permanent Secretary
Foreign Office	*Anthony Eden	Secretary of State
	Sir Alexander Cadogan	Perm'nt Under-sec'y
Fuel and Power, Ministry of	Major Gwilym Lloyd George	Minister
	Sir Frank N. Tribe	Secretary
Health, Ministry of	H. U. Willink	Minister
	Sir John Maude	Secretary
Home Office and Ministry of Home Security	*Herbert Morrison	Minister
	Sir Alexander Maxwell	Perm'nt Under-sec'y, Home Office
	Sir William B. Brown	Secretary, Ministry of Home Security
India Office	L. S. Amery	Secretary of State
	Sir David T. Monteath	Perm'nt Under-sec'y
Information, Ministry of	Brendan Bracken	Minister
	C. J. Radcliffe	Director-General
Inland Revenue, Board of	Sir Cornelius J. Gregg	Chairman
Labour and National Service, Ministry of	Ernest Bevin	Minister
	Sir Thomas W. Phillips	Secretary
Lord Chancellor	Viscount Simon	
Lord Privy Seal	Lord Beaverbrook	
Minister without Portfolio	Sir William Jowitt	(Dealing with postwar reconstruction)
Minister of State	R. K. Law	
Minister of State (Cairo)	*R. G. Casey	
Deputy Minister of State (Cairo)	Lord Moyne	
Minister Resident in W. Africa	Viscount Swinton	
Minister Resident in N.W. Africa	Harold Macmillan	
Minister Resident in Washington for Supply	Ben Smith	
Paymaster-General's Office	Lord Cherwell	Paymaster-General
	L. Cuthbertson	Asst. Paymaster-Gen
Pensions, Ministry of	Sir Walter Womersley	Minister
	Sir Alexander Cunnison	Permanent Secretary
*Post Office	Capt. Harry Crookshank	Postmaster-General
	Sir Thomas Gardiner	Director-General
Privy Council Office	C. R. Attlee	Lord President
	E. C. E. Leadbitter	Clerk of the Council
Production, Ministry of	*Oliver Lyttelton	Minister
	J. H. E. Woods	Permanent Secretary
Reconstruction, Ministry of	Lord Woolton	Minister
	Norman Brook	Secretary
Scottish Office	Thomas Johnston	Secretary of State
	Sir Horace P. Hamilton	Permanent Under-sec'y of State
Supply, Ministry of	Sir Andrew Rae Duncan	Minister
	Sir William Douglas	Permanent Secretary
Town and Country Planning, Ministry of	W. S. Morrison	Minister
	Sir Geoffrey Whiskard	Permanent Secretary
Trade, Board of	Hugh Dalton	President
	Sir Frederick Leith-Ross	Chief Economic Adviser to H. M. Govt.
	Sir Arnold E. Overton	Permanent Secretary
Treasury	*Winston Churchill	Prime Minister, First Lord and Minister of Defense
	*Sir John Anderson	Chancellor of the Exchequer
	Sir Richard V. N. Hopkins	Permanent Secretary and Head of H.M. Civil Service
War Office	Sir James Grigg	Secretary of State
	Sir Frederick C. Bovenschen Sir Eric Speed	Joint Perm'nt Under-sec'ies
War Transport, Ministry of	Lord Leathers	Minister
	Sir Cyril W. Hurcomb	Director-General
Works, Ministry of	Lord Portal	Minister
	F. P. Robinson	Permanent Secretary

Grapefruit. The total grapefruit crop of 1943 was estimated by the U.S. department of agriculture to be 49,187,000 boxes or 3% less than the 1942 crop, but 2% more than was produced in 1941. Florida produced 25,000,000 boxes compared to 27,300,000 in 1942. The Texas crop was estimated at 17,200,000 boxes, a decline of 2% from the previous year. A strong demand kept prices of all citrus fruits at high levels, and

U.S. Production of Grapefruit by States, 1943 and 1942

State	1943 boxes*	1942 boxes*	State	1943 boxes*	1942 boxes*
Florida			California		
Seedless	11,500,000	10,300,000	Desert Valleys	1,316,000	1,254,000
Other varieties	13,500,000	17,000,000	Other varieties	1,771,000	1,817,000
Texas	17,200,000	17,510,000	Arizona	3,900,000	2,600,000

*Net contents of boxes of grapefruit are 60 lb. in California; in Florida and other states, 80 lb.

grapefruit sold at prices more than one-third higher than in 1942. There was a particularly strong demand for fruit juices for the armed forces, lend-lease and civilian consumption.

(J. C. Ms.)

Grapes. The total grape crop of the United States in 1943 was estimated by the U.S. department of agriculture at 2,789,900 tons, 16% more than the 2,402,000 tons produced in 1942 and 18% above the 10-year average 1932–41. This was, up to Jan. 1, 1944, the largest crop on record of this rapidly-increasing fruit. The expansion was chiefly in California where more than 90% of the total production is grown. The California crop in 1943 was estimated to be 2,610,000 tons and 21% higher than the previous year, while production in other states was about the same percentage smaller. The raisin varieties increased 24% and a raisin pack of more than 368,000 tons was expected. Shipments of grapes for the fresh fruit market were restricted and forced

U.S. Production of Grapes in Leading States, 1943 and 1942

State	1943 tons	1942 tons	State	1943 tons	1942 tons
California	2,610,000	2,160,000	New Jersey	2,100	2,600
Michigan	42,400	46,000	Tennessee	2,000	2,700
New York	36,000	69,600	Kentucky	1,800	2,000

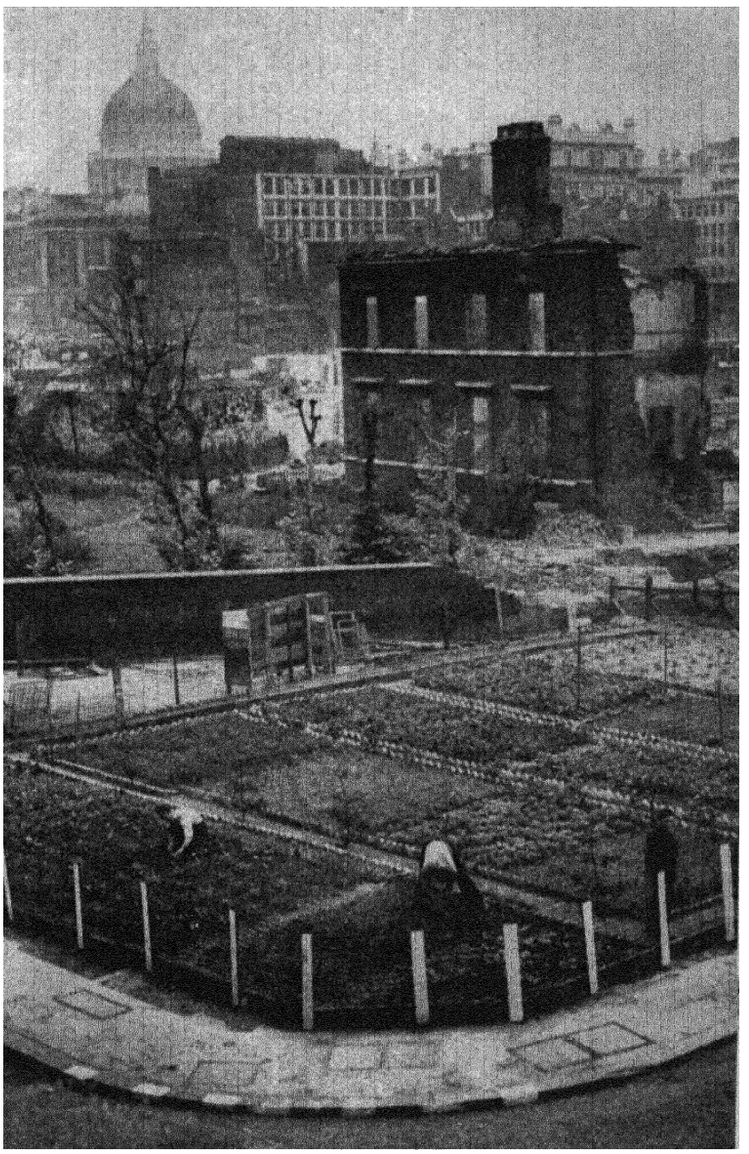
Texas	2,200	2,200	Connecticut	700	1,100
Indiana	2,100	2,800	Florida	450	600

into raisins because of the large wartime demand. To assure the production of much-needed supplies of jams, jellies and lades, the War Food administration placed restrictions on the sale of grapes for fresh consumption in the principal areas of New York, Pennsylvania, Michigan, Ohio and Washington. Price ceilings were above the level of 1942 prices and auction sales at New York ranged from 42% to 85% higher than for the previous year. Ceiling prices of raisins were held to 1942 levels to civilians by the government purchase and resale program. Growers received prices about 40% higher than in 1942.

(J. C. Ms.)

Graphite. There were three graphite plants in operation in Alabama, one in Pennsylvania and one in Texas, and possibly some others, supplying their output for the Metals Reserve Co. stock pile. With this supply, and that of Madagascar again available, stocks were built up to a point where flake graphite was removed from the list of materials short in supply and placed in that in which supply and essential demands were balanced, while amorphous graphite was transferred to the surplus list. Stock-piling was to be discontinued and the mines put in a stand-by condition.

Shipments from Ceylon through Sept. 1943 totalled 298,889 cwt., against 433,367 cwt. in the same period of 1942.



(G. A. Ro.)

Gravel: *see* SAND AND GRAVEL.

Gray, George Kruger (1880–1943), British painter and sculptor, was born Dec. 25 in Kensington and studied at the Royal College of Art. In addition to his sculpture and his landscape and portrait painting, he designed and painted stained glass windows, created numerous ecclesiastical works including altar pieces, war memorials, seals, medals, coins and heraldic works. He designed the coinage and official seals for the Union of South Africa, coins for Australia, Canada, Southern Rhodesia, New Zealand and the new Great Seal of George VI, as well as the Imperial silver coinages of George V and George VI. A London dispatch of May 4 carried the news of his death.

Great Britain & Northern Ireland, United Kingdom of.

This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses: the house of lords consisting of about 670 hereditary peers, 24 spiritual peers, 16 Scottish representative peers, a number of Irish representative peers (in 1940, 14; vacancies are no longer filled) and a few life peers who have held high judicial office; and the house of commons,

VEGETABLE GARDENS began to appear in London in 1943 where gaping craters and demolished buildings had lain since the German air raids of 1940. This garden is in London's East End, with St. Paul's cathedral in the background

numbering 615 members, elected by a practically universal suffrage. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI (*q.v.*); premier: Winston S. Churchill, (*q.v.*); established church: Protestant Episcopal.

Area and Population.—Area 93,991 sq.mi.; pop. (est. Dec. 31, 1939) 47,735,000 (England and Wales 41,417,000). Chief towns (pop. est. June 30, 1938): London (cap.), city and metropolitan police districts, 8,700,000; city and metropolitan boroughs only, 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500; Bristol, 415,000; Hull, 318,700.

History.—As in 1942 the domestic history of the United Kingdom in 1943 was largely a record of industrial and agricultural production. The mobilization of men and materials reached a new high level. Out of 15,900,000 males between the ages of 16 and 64, 15,200,000 were, in the summer, either in the forces or in full-time employment; the remaining 700,000 included schoolboys and the disabled. Out of 17,230,000 women between the same ages, 7,100,000 were in the services or on full-time work. The remaining 10,130,000 included schoolgirls, 650,000 women

in part-time employment, and millions of housewives fully occupied in their homes and with voluntary work. No less than 40% of the aircraft industry's workers consisted of women. In industry hours of labour were appreciably lengthened, in many cases by much more than the average of about 10%. The total production of munitions rose from an index number of 100 in the first half of 1940 to about 300 in the first half of 1943.

The comparative figures of aircraft production were as follows:

	First half of			
	1940	1941	1942	1943
Structural weight	100	161	244	364
Engine horse-power	100	179	373	486

The enormous increase in munitions production, moreover, was achieved in spite of the dislocation involved in the policy of changing over from the production of defensive to offensive weapons which was decided upon at the beginning of 1943, when for the first time the Allies secured the strategical initiative. The production of weapons and equipment which had become obsolete, which were primarily needed for desert warfare, or of which abundant supplies were in reserve, was stopped or curtailed, and production was concentrated on the most modern and offensive types of weapons. Emphasis was laid on the production of aircraft, naval craft specially designed to combat the U-boats, radio equipment, and scientific instruments used in naval warfare.

The concentration of industry, which alone made possible the achievement of the government's vast program of production, was virtually completed during 1943, the only industries from which considerable numbers of workers could still be released being clothing and printing. In this process of concentration some 2,800 establishments were closed down, releasing nearly 250,000 workers for the services or for work in other more vital industries.

Since the wartime demand for labour could never be satisfied, the fall in unemployment continued in 1943. In January, April and October the respective numbers of unemployed in Great Britain were 99,000, 80,000 and 74,000, compared with 136,000 in March 1942.

This mobilization of the country's manpower for war purposes was accomplished without serious opposition either in parliament or elsewhere, though Ernest Bevin's announcement that women up to the age of 51 were to be called up for national service met with some criticism in the house of commons. The government's success in stabilizing the cost of living at 100% above the July 1914 level, the high level of earnings in industry as a whole, and improved industrial relations had largely contributed to the absence of serious labour troubles since 1939. In 1943, however, industrial unrest was becoming more pronounced, though it never assumed really serious proportions. There were many strikes in local aircraft factories, among the miners, the bus workers and the engineers, one or two stoppages (at Nottingham and in a London district) in the railway industry, and dock strikes at Liverpool and in London. The trade unions were pledged by law and agreement not to strike without due notice and previous arbitration procedure, and since 1939 there had been no authorized strike. "Unofficial" strikes, however, were becoming a habit, and the union officials seemed to be powerless to avert them. The main grievances were not the general level of wages, for the average rise in earnings between Oct. 1938 and Jan. 1943 was 65%. On the other hand, workers were sometimes compulsorily moved from higher- to lower-paid work, and the average earnings of miners were considerably less than those of munition workers.

Serious trouble of another kind threatened in the summer of 1943, when the union of post office workers sought affiliation with the Trade Union Congress, in defiance of the Trades Dispute act of 1927. In the end the workers decided to shelve the matter until after the war: had they persisted in their original intention of defying the law, they would have been disqualified from the civil service establishment and would have forfeited their pension rights.

The defense regulations gave the government extensive powers over capital as well as labour. Early in 1943 the minister of aircraft production decided compulsorily to purchase the shares of Short Brothers, as a means of changing the board of directors, and without an undertaking to resell the shares to the proprietors after the war. Unsatisfactory production figures caused this drastic step to be taken: it was said that at one time the firm was taking three times as many man-hours as another firm to produce a comparable aircraft. But Sir Stafford Cripps found the position of the aircraft industry in general satisfactory, and in January he spoke of the valuable contribution which the joint production committees (started in the engineering industry in 1942) were making towards improving factory production.

The Food Situation.—The cost of living was kept stable in 1943, chiefly by means of food subsidies—costing about £70,000,000 in 1940, £145,000,000 in 1942, and £210,000,000 (estimate) in 1943.

The year saw no important changes in rationing or food policy. It was announced in January that a bread-rationing scheme was ready for immediate introduction should such a step become necessary; but Lord Woolton preferred to rely on voluntary restriction of consumption. The potato, he said, was "the key to the food problem," and reiterated appeals were made to eat less bread and more potatoes. During the year, home-grown oats, barley and potato-flour were added to the national loaf, and the system of "points" rationing was extended.

In agricultural as in industrial production, labour was the chief bottleneck, and the Women's Land army (52,000 strong in Jan. 1943) was further increased during the year to take the place of men called to the forces. The farmers again made heroic efforts to increase food production and so relieve the strain on shipping. In 1943 the arable area in the United Kingdom approached 18,000,000 ac., compared with nearly 13,000,000 ac. in 1939. Still more grassland was plowed up. It was estimated that 1,000,000 tons more bread corn were produced than in 1942, and an additional 250,000 tons of potatoes, thus liberating enough shipping to transport overseas eight or ten divisions with their equipment. (*See* AGRICULTURE.)

To relieve the housing shortage in certain rural districts, the ministry of health made plans early in 1943 for the construction of 3,000 new cottages exclusively for rural workers. But by the end of 1943 little had been accomplished, because of the shortage of labour and materials. Building costs had risen by 105% since 1939, and the least expensive of the first 54 houses for which tenders were approved was to cost about £850. (*See* HOUSING.)

Repeated requests for further preferential treatment so far as food rations were concerned, for workers in "heavy" industries, were not conceded, though the provision of works canteens went on. There were in 1943 more than 7,500 works canteens, where at least one cheap and nourishing meal a day could be obtained without the surrender of coupons.

Civilian Casualties.—The number of civilian casualties in air raids on Britain during the first ten months of 1943 was lower than that in any comparable period since the beginning of large-scale air attack; 2,228 people were killed during this period, the figures for the whole of 1941 and 1942 being 20,863 and 3,221 respectively. The number of civilians injured and detained in

hospitals to the end of Oct. 1943, was 3,183, the figures for the whole of 1941 and 1942 being 21,839 and 4,149 respectively. The coastal districts of the south and east were the chief sufferers. London's remarkable new gun barrage was heard for the first time at the beginning of March, when there was an ineffective attack on the capital, apparently in retaliation for the R.A.F.'s heavy assault on Berlin two nights earlier. Damage and casualties were slight, but on this occasion there was a serious accident at one tube station shelter in an East End district. Bad lighting and the lack of sufficient hand-rails and of police supervision caused the deaths from suffocation of 173 people and serious injuries to 62 others, at the beginning of the rush for the shelter.

The cessation of large-scale air raids on Britain caused the government in March to reduce the rates of premium payable on the voluntary "private chattels" scheme for the insurance of furniture and personal belongings, and on the compulsory "business" scheme for the insurance of plant, machinery and business equipment.

Civilian Defense and Rationing.—During the 12 months ended June 1943, the whole-time personnel of the civil defense services was reduced by about one-third, and, though these services continued to be maintained at a high level of preparedness in view of the possibility of large-scale German reprisals for the increasing weight of the R.A.F.'s assault, it was nevertheless found possible to make a further substantial cut in these services in the less vulnerable areas. (*See* CIVILIAN DEFENSE.)

Supplies of goods for civilian consumption had already, at the beginning of the year, been cut to the bone, and the board of trade imposed a ban on the usual January sales, except for the disposal of "oddments." The retail trade in merchandise other than food fell from a monthly average of 102 in 1942 (1937=100) to 89 for the first seven months of 1943. Nearly all clothing would ultimately be "utility"; only "utility" furniture was manufactured after Nov. 1942, and it could be bought only by persons setting up a home on marriage, or in anticipation of the birth of a child, or by persons who had lost their homes through air raids.

The battle for fuel, which began in the summer of 1942, was waged with greater intensity in 1943. Coal rationing was nominally avoided, but supplies nevertheless were severely restricted. The exceptionally mild winter of 1942–43 tended to obscure the growing seriousness of the coal position. Production continued to fall below the corresponding figures for 1942. There was a shortage of young recruits to the industry, the best men were in the forces, the district output bonus scheme was a failure. Pits nearing exhaustion continued to be worked; there was a shortage of machinery for coal cutting; the miners were dissatisfied with their working conditions; and there was much absenteeism. Moreover, from the beginning of July 1943, till mid-November, strikes caused the loss of over 500,000 tons of coal, all the 421 stoppages being unauthorized by the Mineworkers' federation. The failure of voluntary recruitment caused the government in December to decide on a policy of conscription. To the end of September the number of men who, having chosen coal mining as an alternative to the services, had been placed in the mines was only 3,366 (about one-tenth of the total required to offset the annual wastage through death, accident and retirement). A total of 30,000 men between the ages of 18 and 25, it was announced in December, were to be drafted into the mines by the end of April 1944, the men to be chosen by ballot. (*See* also COAL.)

OPERATIONS ROOM of the British navy's command of the western approaches. Here Admiral Sir Max Horton (second from right, near ladder) directed the successful antisubmarine campaign of 1943 in the north Atlantic

Taxation.—The 1943 budget was the largest in British history, the chancellor proposing to spend £5,756,000,000 (more than the whole national income as recently as 1940). He intended to raise £2,908,000,000 in revenue (51% of the total expenditure), representing about £100,000,000 of additional taxation, the increased burden being placed on "voluntary" expenditure on tobacco, alcohol, entertainments and luxury goods, the purchase tax on which was raised to 100%. But the purchase tax was removed from utility cloth and other "utility" textiles. £2,848,000,000 were to be borrowed. When, at the beginning of Sept. 1943, the country entered the fifth year of the war, national expenditure had exceeded £18,000,000,000 and revenue £8,000,000,000, so that about £10,000,000,000 had been added to the national debt, making a total of £18,230,000,000. Sir Kingsley Wood announced the government's intention of maintaining its policy of cheap money after the war, and said that the basic objective to which monetary and economic policy must be subordinated was "active employment for our people."

Hitherto, the amount of a person's income tax had been based on the earnings of the preceding year. In the case of weekly wage-earners (and war taxation greatly increased the number of income-tax payers) the time-lag between money earned and tax paid was ten months: this situation, it was felt, might create hardship whenever earnings either fluctuated considerably, declined, or, through unemployment or old age, ceased. The new chancellor, Sir John Anderson (Sir Kingsley Wood died suddenly in September), decided to apply, as from April 1944, the principle of "pay-as-you-earn," not only to weekly wage-earners, but to all salaried incomes up to £600 a year. Subsequently, in November, he undertook to extend the concession to all Schedule E incomes later in 1944. The weekly tax payment, therefore, would in future be based on the same week's earnings.

Reverse Lend-Lease.—In November the government issued as a *White Paper* a report on "mutual aid," which described Britain's contribution to the war effort of the United Nations. Much of this effort, consisting of services rendered, was incapable of monetary valuation, as the figures were necessarily incomplete. The main items were:

	Millions
Aid given to U.S. forces in Britain (in yr. ending June 1943)	£ 216
Aid to the U.S.S.R. (ing June 1943)	179
Aid to other Allies (to the beginning of 1943)	186
British expenditure in overseas territories, to June 1943	2,250
	£2,831

Legislation.—The output of legislation during the parliamentary session ending in Nov. 1943 was neither large nor important. The commons found the Catering Wages bill exceptionally controversial, the opposition to it coming from all sections of the trade, from the hotels and restaurants association to the coffee stall keepers and the eel and pie traders. The act was designed to secure adequate wages and decent working conditions in the catering industry.

British public opinion in 1943 became increasingly concerned with the problems of peace and reconstruction. In his Mansion House speech in Nov. 1943, the prime minister defined the government's task as that of providing food, work and homes for all, in the immediate postwar years. He proceeded to appoint Lord Woolton minister of reconstruction, with a seat in the war cabinet. At the ninth session of the existing parliament which the king opened on Nov. 24, the speech from the throne foreshadowed the introduction of bills to provide for the reinstatement of ex-servicemen in civil employment; to make further provision for the training and employment of disabled persons; and to reconstruct the national system of education. Further legislation was contemplated, providing for an enlarged and unified system of social insurance and a comprehensive health service, and the reform of workmen's compensation. (A. AL.)

Education.—In 1937–38: elementary, England and Wales—departments under separate head teachers, 29,988, scholars on register 5,150,874; elementary, Scotland—schools 2,895, scholars 617,047; elementary, Northern Ireland—schools 1,700, scholars 191,862; secondary, England and Wales—grant-aided schools 1,398, scholars 470,003; secondary, Scotland—grant-aided schools 252, scholars 156,645; secondary, Northern Ireland—grant-aided schools 75, scholars 14,557; universities, students: England 41,707 (full time, 36,378); Wales 3,089 (full time, 2,970); Scotland 10,384 (full time, 9,841); Northern Ireland 1,590 full-time students.

Banking and Finance.—Revenue, ordinary (est. 1943–44) £2,907,500,000. Expenditure, ordinary (est. 1943–44) £5,756,114,000. Revenue, ordinary (actual 1942–43) £2,922,400,000. Expenditure, ordinary (actual 1942–43) £5,740,300,000. Notes in circulation (Nov. 17, 1943) £1,013,682,527. Public debt (national) March 31, 1943, £15,565,718,000. Exchange rate 1943, £1 = 403.5 cents.

Trade and Communication.—Overseas trade in million £: imports, merchandise (1939) £885.5; (1940) £1,099.9; exports, domestic (1939) £439.6; (1940) £413.1; re-exports (1939) £46.0; (1940) £26.2.

Table II.—*Overseas Trade, Showing the Variations in the First Eight Months (Jan. 1–Aug. 31) of Each of the Years 1937–40*

(in million £)

	1937	1938	1939	1940
Imports	654.4	616.5	605.9	792.9
Exports	341.4	306.9	313.6	312.6
Re-exports	54.2	42.4	36.3	22.6
Total Exports	395.6	349.3	349.9	335.2

Communication.—Roads (March 31, 1938): England and Wales (class I) 20,627 mi.; (Class II) 13,070 mi.; Scotland (class I) 6,632 mi.; (class II) 3,967 mi.; Northern Ireland (class I) 1,273 mi.; (class II) 1,933 mi. Railways (Dec. 31, 1938): Great Britain, track open to traffic, excluding sidings, 20,007 mi.; Northern Ireland, standard gauge 633 mi.; narrow gauge 121 mi. Airways (1938): distance flown 14,331,000 mi.; passengers carried 222,200; mail carried 3,453 tons; freight carried 2,527 tons. Empire services (airways), traffic ton miles including passenger ton miles (1937–38) 7,153,767; (1938–39) 13,734,899; passengers carried (1939) 12,614. Shipping, excluding vessels under 100 tons (July 1, 1939) 17,984,158 gross tons; under construction (July 1, 1939) 791,500 gross tons; shipping (net tonnage with cargo), entered (monthly average 1938) 5,698,000; cleared (monthly average 1938) 4,907,000; entered (Aug. 1939) 6,617,000; cleared (Aug. 1939) 5,525,000. Motor vehicles licensed (Sept. 30, 1938): cars 1,944,394; hackney vehicles (taxis, buses, coaches, etc.) 87,730; commercial vehicles 590,397; motorcycles 462,375; total 3,084,896. Wireless receiving set licences (Sept. 30, 1939) 9,085,050; telephones (Dec. 31, 1939): number of stations (including public and private lines, call boxes, etc.) 3,235,500.

The British railways in 1943 carried the greatest volume of traffic in their history. During the first four years of the war they moved over 1,000,000,000 tons of freight, and ran 180,000 special trains for the transport of troops and equipment. In the summer of 1943 the equivalent of 30 divisions a week was being carried in special trains. Transport restrictions operated all over the country, a 9 P.M. curfew for buses being the general rule.

Agriculture, Manufacturing, Mineral Production.—Production in 1939 (in metric tons): wheat 1,680,000; oats 1,760,800; barley 903,300; potatoes (1938) 5,197,100; beet sugar (1940) 470,000; hops (1938) 131,000; coal (1938) 230,658,000; iron ore (metal content) (1938) 3,615,000; pig iron and ferro-alloys (1938) 6,870,000; steel (1938) 10,565,000; sea fisheries (wet fish only) (1938) 1,062,665; whale oil (1938) 221,100; benzol (1938) 218,800; shale oil (1938) 131,000; beef and veal (1937–38) 688,000; pig meat (1937–38) 415,200; mutton and lamb (1937–38) 257,000; wool (1938) 50,300; wood pulp (1938) 270,000; silk, artificial (1940) 45,360; margarine (1938) 211,600; butter (1938) 47,000; cheese (1938) 44,100; flax (fibre) (Northern Ireland) (1938) 4,100; rye (1938) 10,900; lead ore (metal content) (1938) 30,200; aluminum (smelter production) (1940) 35,000; super-phosphates of lime (1937) 449,000; tin ore (metal content) (1939) 1,700.

Greece. A kingdom in the southern part of the Balkan peninsula, in 1943 under German and Bulgarian occupation, while the Italian influence ended with Italy's surrender to the Allies in Sept. 1943. Area 50,147 sq.mi., of which 41,328 are mainland; pop. (census May 16, 1928) 6,204,684; (estimated, 1940) 7,150,000. Capital, Athens (392,781). Chief cities: Thessaloniki (236,524), Patras (61,278), Cavalla (49,980), Candia (33,404), Corfu (32,221). Religion: mostly Greek Orthodox; 126,017 Mohammedans; 72,791 Jews. King: George II; prime minister (1943): Emmanuel Tsouderos.

History.—The Greek government-in-exile under King George II moved its seat in March 1943 from London to Cairo. The king was not popular with the large republican group in his country, though his new government-in-exile represented all Greek shades. Premier Tsouderos remained in office throughout the year. Vice-Premier Panayotis Kannelopoulos resigned on March 10 and the premier took over the ministry of defense. Vice-Admiral Petros Voulgaris was appointed Greek minister for aviation on May 21.

As in Yugoslavia, the Greek people in the homeland were torn by a violent strife among different factions, royalist, republican and communist. On July 4 the king broadcast from Cairo and appealed for political unity. He promised that as soon as the seat of government could be transferred to Greek soil, its members would resign so that a government fully representative of all parties could be composed. In a letter to Premier Tsouderos made public in December King George declared he would return to Greece only in conformity with the wish of the nation.

The Germans fortified the Greek coast during 1943 against the danger of an Allied invasion, and Allied air forces repeatedly bombed Greek ports and airfields in the fall.

The Greek guerrillas or Andartes were first organized as a national movement on May 20, 1942 and harassed the forces of occupation in spite of savage reprisals by the Germans, under the command of Col. Gen. Alexander Loehr. But the effectiveness of the guerrillas was diminished in 1943 by their split into three warring factions. On the one side was the Greek National Liberation front or E.A.M. with the Popular Liberation army or E.L.A.S., under communist leadership and strongly leftist in its political views. Opposed to it was the Greek National Democratic army or E.D.E.S. under General Napoleon Zarvas. A third group was the National Social Liberation army or E.K.K.A. British liaison officers brought about an agreement among the guerrilla leaders to act together against the Germans, but in the fall of 1943 the Greeks disregarded this agreement and fought more savagely among themselves than against the German invaders.

Education.—Education was compulsory for all children between the ages of 7 and 12. In 1938 Greece had 743 kindergartens with 38,338 pupils, 8,339 primary schools with 985,018 pupils and 407 high schools with 92,687 pupils. There were 3 universities with 7,230 students, an institute of technology with 521 students and a school of fine arts.

Finance.—The monetary unit was the drachma, stabilized in 1928 at 77.02 to the dollar; the stabilization was suspended in April 1932. For the year 1939–40, the revenue was estimated at 14,014,000,000 and expenditure at 14,653,000,000 drachmai. On Dec. 31, 1938, the public debt amounted to 52,140,000,000 drachmai.

Communication and Trade.—Greece had an important merchant marine which consisted on June 30, 1939, of 589 steam and motor ships of 1,812,723 tons and 710 sailing vessels. In 1939 there were 1,668 mi. of railroad and 42 telephone exchanges with 38,427 subscribers.

Taxation.—The 1943 budget was the largest in British history, the chancellor proposing to spend £5,756,000,000 (more than the whole national income as recently as 1940). He intended to raise £2,908,000,000 in revenue (51% of the total expenditure), representing about £100,000,000 of additional taxation, the increased burden being placed on "voluntary" expenditure on tobacco, alcohol, entertainments and luxury goods, the purchase tax on which was raised to 100%. But the purchase tax was removed from utility cloth and other "utility" textiles. £2,848,000,000 were to be borrowed. When, at the beginning of Sept. 1943, the country entered the fifth year of the war, national expenditure had exceeded £18,000,000,000 and revenue £8,000,000,000, so that about £10,000,000,000 had been added to the national debt, making a total of £18,230,000,000. Sir Kingsley Wood announced the government's intention of maintaining its policy of cheap money after the war, and said that the basic objective to which monetary and economic policy must be subordinated was "active employment for our people."

Hitherto, the amount of a person's income tax had been based on the earnings of the preceding year. In the case of weekly wage-earners (and war taxation greatly increased the number of income-tax payers) the time-lag between money earned and tax paid was ten months: this situation, it was felt, might create hardship whenever earnings either fluctuated considerably, declined, or, through unemployment or old age, ceased. The new chancellor, Sir John Anderson (Sir Kingsley Wood died suddenly in September), decided to apply, as from April 1944, the principle of "pay-as-you-earn," not only to weekly wage-earners, but to all salaried incomes up to £600 a year. Subsequently, in November, he undertook to extend the concession to all Schedule E incomes later in 1944. The weekly tax payment, therefore, would in future be based on the same week's earnings.

Reverse Lend-Lease.—In November the government issued as a *White Paper* a report on "mutual aid," which described Britain's contribution to the war effort of the United Nations. Much of this effort, consisting of services rendered, was incapable of monetary valuation, as the figures were necessarily incomplete. The main items were:

	Millions
Aid given to U.S. forces in Britain (in yr. ending June 1943)	£ 216
Aid to the U.S.S.R.	179
Aid to other Allies (to the beginning of 1943)	186
British expenditure in overseas territories, to June 1943	2,250
	£2,831

Legislation.—The output of legislation during the parliamentary session ending in Nov. 1943 was neither large nor important. The commons found the Catering Wages bill exceptionally controversial, the opposition to it coming from all sections of the trade, from the hotels and restaurants association to the coffee stall keepers and the eel and pie traders. The act was designed to secure adequate wages and decent working conditions in the catering industry.

British public opinion in 1943 became increasingly concerned with the problems of peace and reconstruction. In his Mansion House speech in Nov. 1943, the prime minister defined the government's task as that of providing food, work and homes for all, in the immediate postwar years. He proceeded to appoint Lord Woolton minister of reconstruction, with a seat in the war cabinet. At the ninth session of the existing parliament which the king opened on Nov. 24, the speech from the throne foreshadowed the introduction of bills to provide for the reinstatement of ex-servicemen in civil employment; to make further provision for the training and employment of disabled persons; and to reconstruct the national system of education. Further legislation was contemplated, providing for an enlarged and unified system of social insurance and a comprehensive health service, and the reform of workmen's compensation. (A. AL.)

	444,652,000
Votes of Credit	4,900,000,000
Tax Collection—Customs and Excise and Inland Revenue votes (inc. Pensions £1,469,000)	19,458,000
	£5,364,114,000
Total Ordinary Expenditure	£5,756,114,000

*Substantive cost to be met from votes of credit.
†Excluding value of supplies in kind under lend-lease and similar arrangements.

Trade and Communication.—Overseas trade in million £: imports, merchandise (1939) £885.5; (1940) £1,099.9; exports, domestic (1939) £439.6; (1940) £413.1; re-exports (1939) £46.0; (1940) £26.2.

Table II.—*Overseas Trade, Showing the Variations in the First Eight Months (Jan. 1–Aug. 31) of Each of the Years 1937–40*

(in million £)

	1937	1938	1939	1940
Imports	654.4	616.5	605.9	792.9
Exports	341.4	306.9	313.6	312.6
Re-exports	54.2	42.4	36.3	22.6
Total Exports	395.6	349.3	349.9	335.2

Communication.—Roads (March 31, 1938): England and Wales (class I) 20,627 mi.; (Class II) 13,070 mi.; Scotland (class I) 6,632 mi.; (class II) 3,967 mi.; Northern Ireland (class I) 1,273 mi.; (class II) 1,933 mi. Railways (Dec. 31, 1938): Great Britain, track open to traffic, excluding sidings, 20,007 mi.; Northern Ireland, standard gauge 633 mi.; narrow gauge 121 mi. Airways (1938): distance flown 14,331,000 mi.; passengers carried 222,200; mail carried 3,453 tons; freight carried 2,527 tons. Empire services (airways), traffic ton miles including passenger ton miles (1937–38) 7,153,767; (1938–39) 13,734,899; passengers carried (1939) 12,614. Shipping, excluding vessels under 100 tons (July 1, 1939) 17,984,158 gross tons; under construction (July 1, 1939) 791,500 gross tons; shipping (net tonnage with cargo), entered (monthly average 1938) 5,698,000; cleared (monthly average 1938) 4,907,000; entered (Aug. 1939) 6,617,000; cleared (Aug. 1939) 5,525,000. Motor vehicles licensed (Sept. 30, 1938): cars 1,944,394; hackney vehicles (taxis, buses, coaches, etc.) 87,730; commercial vehicles 590,397; motorcycles 462,375; total 3,084,896. Wireless receiving set licences (Sept. 30, 1939) 9,085,050; telephones (Dec. 31, 1939): number of stations (including public and private lines, call boxes, etc.) 3,235,500.

The British railways in 1943 carried the greatest volume of traffic in their history. During the first four years of the war they moved over 1,000,000,000 tons of freight, and ran 180,000 special trains for the transport of troops and equipment. In the summer of 1943 the equivalent of 30 divisions a week was being carried in special trains. Transport restrictions operated all over the country, a 9 P.M. curfew for buses being the general rule.

Agriculture, Manufacturing, Mineral Production.—Production in 1939 (in metric tons): wheat 1,680,000; oats 1,760,800; barley 903,300; potatoes (1938) 5,197,100; beet sugar (1940) 470,000; hops (1938) 131,000; coal (1938) 230,658,000; iron ore (metal content) (1938) 3,615,000; pig iron and ferro-alloys (1938) 6,870,000; steel (1938) 10,565,000; sea fisheries (wet fish only) (1938) 1,062,665; whale oil (1938) 221,100; benzol (1938) 218,800; shale oil (1938) 131,000; beef and veal (1937–38) 688,000; pig meat (1937–38) 415,200; mutton and lamb (1937–38) 257,000; wool (1938) 50,300; wood pulp (1938) 270,000; silk, artificial (1940) 45,360; margarine (1938) 211,600; butter (1938) 47,000; cheese (1938) 44,100; flax (fibre) (Northern Ireland) (1938) 4,100; rye (1938) 10,900; lead ore (metal content) (1938) 30,200; aluminum (smelter production) (1940) 35,000; super-phosphates of lime (1937) 449,000; tin ore (metal content) (1939) 1,700.

Table III.—*Agricultural Production, in Thousands of Metric Tons,* and Acreage, England and Wales, 1938 and 1939*

Crops	1938		1939	
	Thous. met. tons	Acres	Thous. met. tons	Acres
Wheat	1,855	1,830,261	1,555	1,682,616
Barley	803	885,499	794	910,073
Oats	1,069	1,300,530	1,119	1,358,008
Mixed Corn	74	92,240	72	82,781
Seeds hay	1,281	1,184,082	1,700	1,302,858
Meadow hay	3,131	4,220,308	4,535	4,611,564
Beans (for stock-feeding or seed)	106	129,817	109	132,968
Peas (for stock-feeding or seed)	30	38,153	23	36,800
Potatoes	3,486	474,786	3,312	453,076
Turnips and Swedes	5,081	421,190	4,947	394,249
Mangolds	3,599	212,531	3,038	208,891

*One metric ton = .98421 English ton.

Industry and Labour.—Index of industrial production (1929 = 100) av. (1938) 115.5; av. (Jan.–June 1939) 123.1; index of employment (1929=100) av. (1939) 113.0. Industrial population, insured (July 1939) 14,838,000; unemployed, wholly, av. (1940) 802,921; temporary av. (1940) 159,782; wholly av. (1941) 292,000. (*See* also BUSINESS REVIEW; WORLD WAR II.)

Great Lakes Traffic: *see* CANALS AND INLAND WATERWAYS.

Greece. A kingdom in the southern part of the Balkan peninsula, in 1943 under German and Bulgarian occupation, while the Italian influence ended with Italy's surrender to the Allies in Sept. 1943. Area 50,147 sq.mi., of which 41,328 are mainland; pop. (census May 16, 1928) 6,204,684; (estimated, 1940) 7,150,000. Capital, Athens (392,781). Chief cities: Thessaloniki (236,524), Patras (61,278), Cavalla (49,980), Candia (33,404), Corfu (32,221). Religion: mostly Greek Orthodox; 126,017 Mohammedans; 72,791 Jews. King: George II; prime minister (1943): Emmanuel Tsouderos.

History.—The Greek government-in-exile under King George II moved its seat in March 1943 from London to Cairo. The king was not popular with the large republican group in his country, though his new government-in-exile represented all Greek shades. Premier Tsouderos remained in office throughout the year. Vice-Premier Panayotis Kannelopoulos resigned on March 10 and the premier took over the ministry of defense. Vice-Admiral Petros Voulgaris was appointed Greek minister for aviation on May 21.

As in Yugoslavia, the Greek people in the homeland were torn by a violent strife among different factions, royalist, republican and communist. On July 4 the king broadcast from Cairo and appealed for political unity. He promised that as soon as the seat of government could be transferred to Greek soil, its members would resign so that a government fully representative of all parties could be composed. In a letter to Premier Tsouderos made public in December King George declared he would return to Greece only in conformity with the wish of the nation.

The Germans fortified the Greek coast during 1943 against the danger of an Allied invasion, and Allied air forces repeatedly bombed Greek ports and airfields in the fall.

The Greek guerrillas or Andartes were first organized as a national movement on May 20, 1942 and harassed the forces of occupation in spite of savage reprisals by the Germans, under the command of Col. Gen. Alexander Loehr. But the effectiveness of the guerrillas was diminished in 1943 by their split into three warring factions. On the one side was the Greek National Liberation front or E.A.M. with the Popular Liberation army or E.L.A.S., under communist leadership and strongly leftist in its political views. Opposed to it was the Greek National Democratic army or E.D.E.S. under General Napoleon Zarvas. A third group was the National Social Liberation army or E.K.K.A. British liaison officers brought about an agreement among the guerrilla leaders to act together against the Germans, but in the fall of 1943 the Greeks disregarded this agreement and fought more savagely among themselves than against the German invaders.

Education.—Education was compulsory for all children between the ages of 7 and 12. In 1938 Greece had 743 kindergartens with 38,338 pupils, 8,339 primary schools with 985,018 pupils and 407 high schools with 92,687 pupils. There were 3 universities with 7,230 students, an institute of technology with 521 students and a school of fine arts.

Finance.—The monetary unit was the drachma, stabilized in 1928 at 77.02 to the dollar; the stabilization was suspended in April 1932. For the year 1939–40, the revenue was estimated at 14,014,000,000 and expenditure at 14,653,000,000 drachmai. On Dec. 31, 1938, the public debt amounted to 52,140,000,000 drachmai.

Communication and Trade.—Greece had an important merchant marine which consisted on June 30, 1939, of 589 steam and motor ships of 1,812,723 tons and 710 sailing vessels. In 1939 there were 1,668 mi. of railroad and 42 telephone exchanges with 38,427 subscribers.

In 1940 the value of imports amounted to 12,215,000,000, the value of exports to 9,079,000,000 drachmai. Germany was first and the United States second in both imports and exports. The chief imports were cotton piece goods, woollen goods and machinery; the chief exports, currants, raisins and tobacco.

Agriculture and Mineral Production.—Greece is chiefly an agricultural country, though the mountainous character allows only one-fifth of the area to be cultivated. Olive and fruit, tobacco and currants are ordinarily produced in great quantities and good quality. Breeding of sheep and goats is important. Iron ore and pyrites, magnesite, lignites, chromites, lead and emery are found. Industrial development is insignificant, but was growing before the German invasion of 1941.

Greenland. The world's largest island (736,518 sq.mi., some 705,000 covered by glacier), in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under United States protection in 1941. Capital, Godthaab. A population of about 18,000 (est. 1941) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 600 in all being Danes, the rest native Greenlanders. Seats of the governors are Godhavn in the north and Godthaab in the south.

History.—Through 1943 Greenland continued under the regime established by the agreement of April 9, 1941, between the Danish minister in Washington, Henrik de Kauffmann, and Secretary of State Cordell Hull. The continuance of Danish sovereignty was recognized; the United States obtained the right to build bases for planes, radio and weather stations, and to maintain them by "any and all things necessary"; the agreement to stand "until the present dangers to the American continent have passed." Actual administration in Greenland remained in Danish hands as before.

Greenland's cryolite, vital for the manufacture of aluminum, continued to move to Canada and the U.S. during 1943. Trade relations were largely with the U.S. because of the continued closure of the old-established monopolistic connections with Denmark.

One of the small but important actions of the war took place in 1943 off Greenland's east coast, where for the second time in two years a German weather station was demolished. Reports of weather conditions from Greenland had become essential for accurate forecasting in the North Atlantic and even in western European regions. Hence when the U.S. army sledge patrol spotted the new nazi base on an island off the coast the Germans knew they would be attacked. They captured two of the patrol, however, and killed the third man. Then they attacked a hunting and weather station to the north operated by Danes, most of whom escaped in the darkness. One, made prisoner, was forced to guide the German lieutenant on an exploring trip; he watched for an opportunity, overpowered the nazi, and after a 40-day sledge trip handed him over to army custody. Two coast guard cutters forced their way slowly through the ice toward the base, and planes bombed the installations as early as May. The bombings destroyed all but one of the carefully built structures of the post, and sank the German supply ship. When the coast guard force arrived no Germans were left, though at other points the Americans took two prisoners. Presumably the rest of the force had been evacuated by plane.

Trade and Finance.—Exports (largely fish and fish products) in 1939 totalled 1,847,000 kroner (1 krón = 18¢ U.S. in 1939), exclusive of export of 56,455,300 kg. of cryolite. Imports in 1939 totalled 4,149,000 kr. and consisted chiefly of foodstuffs (607,000 kr.), wood (468,000 kr.), manufactures (451,000 kr.), fruits and other colonial wares (389,000 kr.), meat (253,000 kr.).

The government budget for 1939–40 was balanced at 6,035,000 kr.

Gregory, Jackson (1882–1943), U.S. author, was born March 12 at Salinas, Calif. He became a high school principal but soon forsook his academic career for newspaper reporting. Beginning in 1914 he wrote more than a score of books, mainly western adventure tales, including *Wolf Breed* (1917), *Judith of Blue Lake Ranch* (1919), *Redwood and Gold* (1928), *Sudden Bill Dorn* (1937) and *Ace in the Hole* (1941). He completed his last book, *The Hermit of Thunder King*, shortly before his death in Auburn, Calif., June 12.

Gromyko, Andrei A. (1909–), Russian diplomat, was born July 5 in the village of Stayre Gromyki in the Gomel region of the U.S.S.R. After his graduation from the Minsk Institute of Agricultural Economics in 1934, he became a member of the scientific staff of the Institute of Economics of the Academy of Science of the U.S.S.R. He remained in the post until May 1939, when he was made chief of the division of American countries in the people's commissariat of foreign affairs. Only a few months later he again resigned to become counsellor of the U.S.S.R. embassy in Washington. He served in this capacity under Ambassador Constantine Oumansky until 1941, then under Ambassador Maxim Litvinov. On Aug. 21, 1943, diplomatic circles were startled to learn that Ambassador Litvinov had been recalled and Gromyko appointed ambassador in his stead. This was the second change in Russian diplomatic personnel to be made within a short time, for Ivan Maisky, ambassador to London had been recalled the preceding month. Speculation on the significance of these changes was widespread, especially in view of the forthcoming conference at Moscow. On Sept. 2 it was announced that Gromyko had also been appointed to succeed Litvinov as ambassador to Cuba.

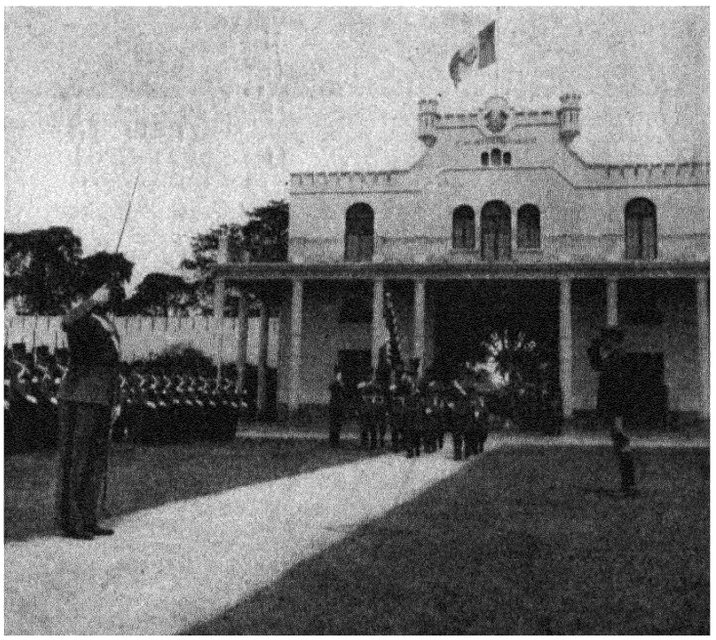
Guadalcanal: *see* SOLOMON ISLANDS; WORLD WAR II.
Guadeloupe: *see* FRENCH COLONIAL EMPIRE.

Guam. Guam is the largest and most populous of the Mariana group of islands in the North Pacific, is in 13° 26′ N. lat. and 144° 39′ E. long., and is located about 1,823 mi. S.E. of Hongkong, about 1,506 mi. E. of Manila and 5,053 mi. S.W. of San Francisco. Pop. (1940) 22,290; area 206 sq.mi. Capital Agana (10,004).

History.—The question of fortifying Guam had been discussed in naval circles as U.S.-Japanese relations became more tense in the later 1930s. The naval appropriations bill of 1939 contained an item of $5,000,000 "to establish, develop or increase naval aviation facilities" in Guam, to improve harbour facilities and "for other purposes." However, the item relating to Guam was struck out of the bill before it reached the senate. Subsequently, however, the government initiated construction operations on Guam, and a number of building workers were caught when the island was attacked by the Japanese immediately after Pearl Harbor. A Japanese statement of Dec. 12, 1941, claimed the occupation of Guam and the capture of 300 Americans, including the governor of the island, Capt. G. G. McMillin. The navy department confirmed the loss of the island the next day.

After that time Guam was out of the news. It was so far within the Japanese naval defense lines that it had not yet been attacked by U.S. naval or air forces up to the end of 1943.

Government.—Under U.S. administration the governor of Guam was a navy officer with the rank of captain. The governor was also commandant of the naval station. There was a native congress with advisory powers, but the governor possessed final authority. The natives of Guam are of Chamorro stock, with a strong intermixture of Spaniards and Filipinos. The language is a Malay dialect, corrupted by Tagal (a Filipino dialect) and Spanish.



Industry and Trade.—The economy of Guam is predominantly agricultural. Production is almost entirely for local consumption and includes corn, rice, sweet potatoes, coffee, bananas, pineapples, citrus fruits, limes, breadfruit, mangoes, yams, tobacco, alligator pears, sugar cane and timber. The only export product of any consequence is copra, the normal crop being about 2,000 tons. Imports and exports for the year ending June 30, 1940, were $642,936 and $102,575, respectively. Most of the imports were for the benefit of the naval and marine forces.

Finance and Education.—The revenues for the fiscal year 1940 were $283,619 and expenditures were $259,626. The only banking institution was the Bank of Guam, established by the naval government in 1915 for general banking business and as a depository of the naval government of Guam. Education under U.S. administration was compulsory between the ages of 7 and 12. In 1940 there were 23 primary schools, 5 industrial schools, one high school, one private school and one school for Americans. Average enrolment was 4,694. (W. H. CH.)

Guariglia, Raffaele (1889–), Italian diplomat, a doctor of laws from the University of Naples, served from 1910 to 1919 in various embassy offices: Paris, London, St. Petersburg (now Leningrad), Brussels. In 1920 he became chief of the oriental bureau of the Italian foreign office, retaining the position until 1926, notwithstanding the fascist upheaval of 1922. In 1926 Guariglia became director general of political affairs for the Italian foreign office. From 1932–35 he was ambassador to Spain, returning to Italy to take charge of Ethiopian affairs. In 1937 he became ambassador to Argentina; in 1938 to France, where he remained until Italy's declaration of war. In Feb. 1943, Guariglia was sent to Turkey as ambassador. He was secretary of foreign affairs in the cabinet formed by Marshal Pietro Badoglio, July 26, upon Mussolini's downfall. A period of intense activity followed. Guariglia sought first Turkish, then Vatican, aid in negotiating a peace. He conferred with Ribbentrop in Italy on Aug. 6, but was unable to get the Germans to withdraw peaceably from Italy. On Sept. 15, German sources reported that Guariglia had been placed under arrest at the order of the German puppet governor of Rome.

Guatemala. A republic of Central America, bounded by Mexico, British Honduras, Honduras and El Salvador. Area, 42,364 sq.mi. (a boundary dispute with British Honduras was suspended for the duration). Pop. (1940 census), 3,284,269, of whom two-thirds are Indian. Capital: Guatemala City (163,826); other cities: Zacapa (14,443); Quetzaltenango (33,538); Cobán (8,001); Chiquimula (10,868); Puerto Barrios (15,784); Totonicapán (5,623). Religion: Roman Catholic. President in 1943: General Jorge Ubico.

History.—Affairs in Guatemala were quiet during 1943, with little change in policies or general conditions. The main effects of the war were felt in rising living costs, estimated at as much as 40% over 1941. Factors causing the rise were on the one hand due to an augmented income because of a profitable coffee year and the export of foodstuffs to the Canal Zone, also the high wages paid on various war construction projects, and on the other hand to the diminishing supply of consumer goods. Various types of regulatory control remained in effect, such as the freezing of rents and of certain imported items, a moratorium on car payments, gasoline rationing and the prohibition of export for some items (cattle export was forbidden May 6).

REVIEW OF CADETS at the Guatemalan military academy in 1943

Education.—Schools in 1942 numbered 2,691. Enrolments were as follows: infant schools 9,680; primary schools 130,802; adult schools 4,503; normal schools 1,039; vocational schools 3,236; secondary schools 1,006. Enrolment in the National university was 576.

Finance.—The monetary unit is the quetzal, maintained at parity with the United States dollar. The internal debt of Guatemala (1942) was 3,877,134 quetzales; the external debt, 1,520,432. The circulating medium averaged (1942) 27,991,482 quetzales. Revenue for the first quarter of 1943 was 5,075,000 quetzales; expenditures, 3,504,000 quetzales.

Trade and Communication.—No complete trade figures were available; in 1941 exports were valued at $14,502,803; imports at $16,098,907. The trade balance with the United States for nine months of 1943 was favourable to the extent of $6,669,000.

Agriculture is the main industry of Guatemala. Coffee exports for the 1942–43 coffee season (Oct.-June) were 678,941 bags of 132 lb. each. Banana exports (1942) amounted to 4,639,888 stems (1941: 7,151,593 stems). Chicle exports amounted to 3,538,000 lbs. (1941: 2,878,000 lb.). The 1942–43 sugar crop estimate was 22,800 tons; cotton (1941–42), 1,914,957 lb.; wool (1941–42), 376,761 lb. Milk, butter, and cheese (1941–42) were produced in the amounts of 12,727,585 gal., 1,168,238 lb., and 3,027,590 lb., respectively. Fibre production (1942) was: maguey, 768 tons; henequen, 85 tons; yucca, 12,552 tons.

The total highway mileage is 3,998 mi.; the federal system amounts to 1,806 mi. (with 427 additional mi. under construction); the remainder is departmental highway. In 1941–43 road-building machinery shipped from the United States was valued at $145,270. Railway mileage is 600 mi. public road, 280 mi. private. External and internal air service is extensive. (*See* also BRITISH HONDURAS.)

Guggenheim Memorial Foundation. The John Simon Guggenheim Memorial foundation granted 79 fellowships, with stipends totalling about $205,000, for the year 1943–44. Of these awards, 59 went to the fellowship program of the United States, 5 to that of Canada, and 15 to the program of Latin America. Since its establishment in 1925 by Simon Guggenheim and his wife, the foundation had, by 1943, contributed about $2,692,000 in the form of 1,304 fellowships to the advancement of research in all fields of knowledge and creative work in the arts.

At the time of the death of Guggenheim in 1941, the foundation, already having an endowment of $8,415,131, became the residuary legatee of almost his entire estate. All contributions had been made by the co-founders. Headquarters of the foundation are at 551 Fifth avenue, New York city.

Gustavus V (1858–), king of Sweden, of whom a biographical account will be found in the *Encyclopædia Britannica,* ascended the throne in 1907, and years before 1943 had attained the rank of Europe's oldest living monarch.

The eighty-five year old sovereign continued in 1943 as leader of his nation's neutrality, a personification to his people and to the world of the strict and persistent policy which held Sweden to peace. Firmly and honestly he attempted to fulfill his chosen motto: "With the people for the fatherland." (F. D. S.)

Gymnastics. Arthur E. Pitt of Union City, N.Y., continued his dominance of the National A.A.U. gymnastic championships during 1943 to capture the all-around title and place his Swiss Gymnasium society second in the team standings. Pitt repeated his all-around conquest with firsts in calisthenics, side horse and horizontal bar, scoring 295.1 points to 275.8 for Ensign Newton Loken of the Iowa Pre-Flight school. Although Penn State college won only one individual title, its accumulation of seconds and thirds brought the collegians the team title with 64 points to 41½ for the Swiss Gym society.

After a year's lapse, the women's nationals were held in conjunction with the men's at New York and resulted in the Philadelphia Turners easily winning the team title. Pearl Nightingale of the Philadelphia team won the all-around women's championship with firsts in the side horse vault, flying rings and parallel bars. (M. P. W.)

Gynaecology and Obstetrics. William P. Healy re-emphasized the importance of periodic examinations to ensure early diagnosis of the "silent disease," cancer of the genital organs; he recommended further investigation of the possible influence of endocrine glands on cancer. H. E. Schmitz and his coworkers offered noteworthy contributions on the effect of preoperative irradiation of adenocarcinoma of the uterus, using progressively increasing dosage with radium augmented by deep X-ray therapy. Results in general from treatment of cancer of the female pelvic organs seemed to be slowly but only slightly improving.

Emil Novak stated that recent studies have not added much to our knowledge of the physiology of endocrine glands in pregnancy, lactation and the puerperium, whereas progress has been made in the treatment of such conditions as amenorrhoea and sterility, primary dysmenorrhoea, functional bleeding, and disturbances of the menopause.

The treatment of acute gonorrhoeal infection by sulfanilamide and sulfathiazole was in 1943 firmly established. One of the latest and largest series of salpingitis (214 cases) to be so treated was described by D. N. Barrows and J. S. Labate. They found that this chemotherapy was remarkably and quickly effective for both gonorrhoeal salpingitis and associated vaginitis. They stated that the earlier it is possible for the treatment to be begun the more rapid is the subsidence of the masses and the disappearance of symptoms.

In the field of sterility studies, that is, of "barren marriages," interest was aroused by accounts of success from artificial insemination. Briefly, this consisted in the use of seminal fluid from professional donors, unknown to the sterile couple, for artificial injection into the uterus of the wife when the husband had been proven sterile. Scientifically this might be acceptable but, as said by George W. Kosmak, "whether ethical considerations should be subordinated to those of a material character to relieve sterility is more than an academic problem . . . to place (human relationships) on a level with the propagation of animal life undertaken for convenience and gain."

Claire E. Folsome, of New York, where most of this agitation to apply "experiences of veterinary practice to the human subject" (Kosmak) were current, analyzed some of the extravagant claims and statistics of advocates of the procedure. Folsome's study showed it to be a "medical procedure valuable only as a final answer in certain carefully selected and thoroughly studied cases." Even then the "results obtained . . . have been little more than mediocre." Folsome's review was "to place on record a protest against publication of such extreme claims on the subject of human sterility until these are checked and verified."

In obstetrics, the year 1943 saw as one outstanding contribution the establishment of continuous caudal analgesia as an accepted procedure for relief of pain during labour and delivery. It was promulgated by W. B. Edwards and R. A. Hingson, and is spectacularly effective as well as apparently safe, when given by skilled individuals. Otherwise, of course, it has risks as does any anaesthetic unskilfully administered. The method consists in injection of an anaesthetic mixture (procaine or "metycaine") into the caudal canal at the lower end of the sacrum but outside the spinal canal itself. Thus these low-lying nerves and their ganglia are anaesthetized so that the patient feels no pain, repeated injections being given at intervals through the needle left *in situ* in order to maintain this state of analgesia or local anaesthesia. The patient remains conscious, the infant is unaffected, and the maternal soft parts, often resistant, are more relaxed than usual thus facilitating labour and delivery. The method is safe provided the person administering the analgesia is trained and experienced in the method. The authors of the method completed a comprehensive monograph on the subject to be published early in 1944.

Many instances of thrombophlebitis result, according to Alton Ochsner and Michael E. de Bakey, from a spasm of the blood vessels of neurogenic origin. They demonstrated that the pain and swelling, as well as much of the interference with venous circulation, could be promptly relieved by an injection of the meninges of the spinal cord at proper sites, using an anaesthetic mixture usually procaine hydrochloride. This suggestion gained wider acceptance during 1943 when Edwards and Hingson found their method of analgesia described for labour and delivery particularly efficacious for thrombophlebitis. This did not replace the use of heparin.

World War II had its influence on obstetric care. E. J. Krahulik and W. B. Thompson advocated what many have had to practise, namely the conclusion that greater service could be offered to the community by hospitals if a larger number are given hospital delivery through abbreviated periods of postpartum care in the hospitals. They recommended that patients stay only 8 to 10 days, and then depend upon help from neighbours and relatives at home. H. A. Stephenson amplified this plan by suggesting less frequent antenatal office visits and relegation of office routine to the nurse on account of the physician shortage.

Legislation for federal aid in obstetrics and pediatrics for families of enlisted service men under the children's bureau of the department of labor was enacted. This provided money grants to pay $50 as the doctor's fee for confinement, and sufficient additional to give the patient a limited period of hospitalization of the "semi-private" room type. This was received with mixed reactions by the medical profession. Some endorsed it, but others looked upon it as a trial attempt at socialization of medicine under government control.

Gypsum. Mine production of gypsum in the United States decreased by 2% in 1942, to 4,697,568 short tons, and production of calcined gypsum was still lower. Production of crude and calcined gypsum was respectively 17% and 20% lower in the first three quarters of 1943 than in the same period of 1942. The main losses were in uses in building construction; while several minor uses showed gains, the tonnages involved were small, and the only important use showing an increase was agricultural gypsum.

Canada showed a heavy drop in gypsum production in 1942, with 580,575 short tons, a 64% decrease from the record high made in 1941. The decline was mainly due to lack of shipping facilities, the bulk of the Canadian output being normally exported to the United States. The decrease continued in 1943, output through August being 48% less than that of the same period of 1942. (G. A. Ro.)

Haakon VII (1872–), king of Norway, of whom a biographical account will be found in *Encyclopædia Britannica*, was born Prince Charles of Denmark, second son of Frederick VIII (and brother of Christian X). Upon the separation of Norway from Sweden he was elected king by the Norwegian Storting (Nov. 18, 1905), and took the old Norse name of Haakon, and that of Olav for his son, the crown prince. Haakon married Maud (1869–1938), youngest daughter of King Edward VII of England.

The unanimous loyalty of Norwegians to their exiled king after 1940 was more than a sign that their land was in trouble. Haakon's personal bravery and uprightness, his nonpartisan nationalism, his zealous industry, his dignified acceptance of necessity while fighting vigorously for the independence of his people, all gave rich meaning to the motto he had chosen in 1905: "All for Norway." Through disillusionment, bitterness, distress from 1940 through 1943, the Norwegian people both at home and abroad, on land and sea, had one rallying point. In 1943 hopes brightened for both the king and his people as he, in London, guided and personified Norwegian resistance. (*See* also NORWAY.) (F. D. S.)

Haiti. A West Indian republic occupying the western third of the island of Hispaniola (also known as Haiti). Area: 10,748 sq.mi. Pop. estimates vary from 2,600,000 to 3,000,000, with the latter figure usually quoted. The population is almost entirely Negro. The capital is Port-au-Prince (pop. 125,000); other cities are: Les Cayes (15,000); Cap Haitien (20,000); Gonaïves (20,000); Jacmel (10,000). Official language: French; official religion: Roman Catholic, with the lower classes practising the folk religion of vodun or voodoo. President in 1943: Elie Lescot.

History.—Haiti continued during 1943 policies in inter-American co-operation as they had been laid down in the previous two years. Much interest was centred on the work of SHADA (the Société Haitiano-Américaine de Developpement Agricole), notably in the production of rubber. By the end of 1943 it was estimated that the agency would have between 60,000 and 85,000 acres planted to cryptostegia, harvesting about 3,000 lb. of rubber therefrom in the following year and possibly 12,000 tons in 1945. SHADA also produced some sisal, lumber, oils, cacao, fruits and spices. Some Haitians feared that the emphasis on rubber production would lead to serious problems after the war; after a visit of President Lescot to the United States this aspect of Haitian economy was covered by a Washington announcement in November that a study of postwar possibilities for small industry would be made, that an additional $9,600,000 would be spent on the rubber project, and that United States experts would be available for solution of island problems.

Shipping to Haiti increased during 1943 over the previous year, and general economic conditions were better. Nevertheless, war shortages were felt. Little newsprint was available for Haiti's 52 publications, and most newspapers were reduced to two pages. In March goods were ordered moved by boat whenever possible. Export of staple domestic foodstuffs was also prohibited in March.

Education.—Haiti was estimated (1941) to have 176 urban

ELIE LESCOT (right), president of Haiti, being welcomed at Washington Oct. 14, 1943 by President Roosevelt and Representative Sol Bloom (left), chairman of the house foreign affairs committee. Mrs. Roosevelt is in the background

primary schools, enrolment approx. 40,000; 459 rural elementary schools, enrolment 33,246; 200 Catholic parochial schools (elementary), enrolment approx. 12,000. There were 10 vocational schools, with 1,368 pupils; 17 secondary schools, with 4,000 students. Statistics are questionable, since enrollment does not necessarily mean attendance. The illiteracy rate approximated 90%. English was being introduced into all grades above the fourth; in March seven teachers were reported sent from the United States to launch the program.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. Revenue (for the fiscal year Oct. 1, 1942–Sept. 30, 1943) was $6,545,817 (1942: $5,119,851); expenditures were $5,605,906 (1942: $5,545,232). The public debt on Sept. 30, 1943, was $13,226,609 (1942: $14,117,850).

Trade and Resources.—Haitian trade for 1942–43 totalled 94,320,000 gourdes (imports: 44,883,000 gourdes; exports: 49,437,000 gourdes). Haiti's favourable export balance with the United States on Sept. 30 was $1,276,000. The United States took approx. 81% of exports, and supplied 75% of imports. Haitian products are almost entirely agricultural, and are indicated in the following table:

Haitian Exports, 1941-42 and 1942-43 (11-month period)

Product	1942-43	1941-42
Coffee	25,003,520 kilos	15,810,820 kilos
Cacao	1,070,949	1,240,822
Logwood	2,917,000	2,493,000
Cotton	1,559,746	2,289,536
Sisal	9,538,388	9,380,919
Raw sugar	11,534,422	6,580,543
Bananas	442,828 stems	1,930,934 stems

Communication.—External communication is by sea and air; shipping increased in 1943. Highway mileage is 2,937 km. improved road, 43,987 km. unimproved. Motor traffic was seriously curtailed by lack of fuel and equipment. The 1941–42 allowance for highways was 626,089 gourdes. Haiti has about 160 mi. of railroad.

BIBLIOGRAPHY.—Harold Palmer Davis, *Black Democracy* (1929); James Graham Leyburn, *The Haitian People* (1941); Chester Lloyd Jones, *The Caribbean since 1900* (1936). (D. RD.)

Hall, Radclyffe (1886?–1943), British novelist and poet, was born in Bournemouth, Hampshire, England, and was educated at King's college, London, and in Germany. Her best-selling novel, *The Well of Loneliness,* published in 1928 caused a furore in England and the United States and was the subject of court disputes in both countries to determine whether or not the work was immoral in subject and tone. Miss Hall's other works include the following novels: *The Forge, The Unlit Lamp* (1924), *A Saturday Life* (1925), *Adam's Breed* (1926), which won several prizes as the best book of that year and the gold medal of Eichelbergher Humane Award in 1930, *The Master of the House* (1932) and *Sixth Beatitude* (1936); a collection of short stories, *Miss Ogilvy Finds Herself* (1934) and numerous poems set to music. An uncompleted novel at which she was working at the time of her death was destroyed according to her wishes. She died in London, Oct. 7.

Hall, Sir (William) Reginald (1870–1943), British intelligence officer, was born June 28. His genius for code deciphering and spy-trapping came to the fore during World War I when he was made director of naval intelligence. In 1914, he devised the system of false messages that lured a German naval squadron into a fatal trap near the Falkland Islands, where it was set upon by British warships and ultimately destroyed. Sir Reginald also used trick messages to entice the unsuspecting Franz von Rintelen, chief of German espionage in the United States in World War I, back to Europe, where he was captured off Ramsgate in August 1915 while he was enroute to the reich. Another of Sir Reginald's accomplishments was the interception of the historic Bernstorff letter inviting Mexico to join with Germany against the United States during the first world conflict. After the war, he returned to "shore duty" and was an M.P., 1919–29. Sir Reginald, who was knighted in 1918, retired from the navy in 1926 with the rank of admiral. He died in London, Oct. 22.

Halsey, William Frederick, Jr. (1882–), U.S. naval officer, was born Oct. 30 in Elizabeth, N.J. An Annapolis graduate, he commanded a destroyer patrol force in World War I. Subsequently he was commander of the aircraft carrier "Saratoga," commandant of the Pensacola naval air station, and, in 1938, commander of a carrier division including the "Yorktown" and "Enterprise." Vice-Admiral Halsey led the attack against Japanese bases on the Marshall and Gilbert Islands, Jan. 31 and Feb. 1, 1942. On Oct. 24 he replaced Vice-Admiral Robert Lee Ghormley as commander of U.S. naval forces in the South Pacific. Three weeks later Halsey engaged a large Japanese force off the Solomon Islands in a three-day battle. Although outnumbered, his fleet was victorious, sinking 28 Japanese ships. In recognition of this achievement, Halsey was made a full admiral and awarded the congressional medal of honour. In 1943 he continued his aggressive naval warfare, demonstrating further what Admiral Chester W. Nimitz called his "rare combination of intellectual capacity and military audacity." He conferred with General MacArthur in May, and, on July 2, his force was put under MacArthur's command. Further victories in the Solomons followed. In a battle off Bougainville shortly after the initial landings on Nov. 1, Halsey's fleet sank five Japanese ships and damaged four.

Hammerstein-Equord, Kurt von, BARON (1878–1943), German army officer, was born Sept. 16 in Hinrichshagen, Mecklenburg-Strelitz, of a Junker family. He joined the army in his youth and during World War I was major on the general staff. Hammerstein-Equord was involved in the postwar Kapp *putsch,* a conspiracy of the German army to seize control of the government. In this plot, his father-in-law, Gen. Walther von Luettwitz, an extremist leader, marched his troops into Berlin in 1920 and with Wolfgang Kapp established a short-lived government. Hammerstein-Equord was promoted to commander in 1929 and was named to the army command in 1930. He resigned, however, in 1933 with rank of general, shortly after Hitler came to power and was replaced by Col. Gen. Werner von Fritsch. It was rumoured at that time that he was out of sympathy with the new regime, a report that seemed to be substantiated by his continued retirement during the years when the army reached its greatest period of expansion. A notice of his death appeared in a Berlin newspaper, April 24.

Hammer Throw: *see* TRACK AND FIELD SPORTS.

Hand-ball. The continuance of the war seriously curtailed competitive activity of this sport with the result that in 1943 only one national tournament was held. This was the annual classic of the four-wall championships, held at the Olympic club of San Francisco. The winner in the singles was Joseph P. Platak of Chicago, serving with the U.S. navy, who regained the title he was forced to vacate the previous year because of his inability to obtain the necessary furlough. Platak had previously won the championship for seven years in succession and his 1943 victory made it his eighth triumph and gained for him third place in the country among the outstanding athletes of the year.

National Four-Wall Rankings for 1943

Singles	*Doubles*
1. Joseph P. Platak, Chicago	1. Joe Gordon and H. Smith, Long Beach, Calif.
2. Abe Smith, Oakland, Calif.	2. Al Cram and B. Hackney, Long Beach, Calif.
3. Angelo Tocchini, Oakland, Calif.	3. R. Leu and M. De La Pena, San Francisco, Calif.

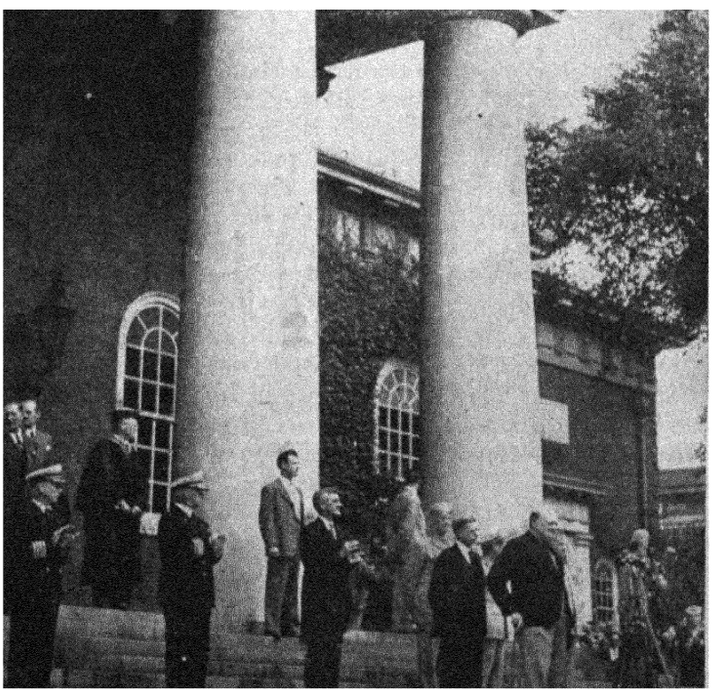
(FR. RO.)

Harbours: *see* RIVERS AND HARBOURS.

Harper, Samuel Northrup (1882–1943), U.S. educator and son of William Rainey Harper, first president of the University of Chicago, was born April 9 in Chicago. After receiving his A.B. degree in 1902, he studied at the École des Langues Orientales Vivantes in Paris and at Columbia university. One of the leading U.S. authorities on Russian life and language, he made 18 trips to Russia to study the tsarist and soviet regimes. He joined the faculty of the University of Chicago in 1905 as assistant professor of Russian language and institutions and was named head of the department in 1930. Professor Harper served as special attaché to the Russian division of the state department in the first years of the soviet union and was the author of numerous works in his field. He died in Chicago, Jan. 18.

Harriman, W. Averell (1891–), U.S. diplomatic representative, was born Nov. 15, son of E. H. Harriman, railroad magnate. On his graduation from Yale university in 1913 he carried on in his father's enterprises, becoming chairman eventually of the Illinois Central and Union Pacific railroads, as well as a partner in Brown Brothers, Harriman and company. Entering government service during President Roosevelt's first term of office, he served as an NRA administrator, a member of the business advisory council of the department of commerce and director of the raw materials division of the Office of Production Management. In March 1941, he was sent to Great Britain as lend-lease representative, with the rank of minister. In Sept. he headed the American delegation of a U.S.-British joint mission to Moscow. In Aug. 1942, he visited Moscow again at the time of the Stalin-Churchill conferences. On Oct. 1, 1943, Pres. Roosevelt named Harriman ambassador to the U.S.S.R., succeeding Adm. William H. Standley. He was escorted to Moscow by Secretary of State Cordell Hull and there participated in the tripartite conferences.

Harris, Sir Arthur T. (1892–), British air officer, was born April 13 in Cheltenham, England. Educated in English public schools, he enlisted during World War I and joined the royal flying corps in 1915. He commanded several squadrons on the western front and was decorated with the air force cross in 1918. Made an air commodore in 1937, he was named air vice-marshal in 1939 and rose to commander in chief of the R.A.F. bomber command in Feb. 1942. A firm believer in mass raids, Air Marshal Harris developed the "saturation" technique of mass bombing—that of concentrating clouds of bombers in a giant raid on a single city with the object of completely demolishing it. He applied this method with great destructive effect on axis-occupied Europe beginning in 1942 and continuing throughout 1943.



Hart, Albert Bushnell (1854–1943), U.S. educator, was born July 1 at Clarksville, Pa. He was connected with the faculty of Harvard university for 43 years before retiring in 1926 as professor emeritus of the science of government. After his retirement, he maintained quarters above Widener library and continued his writings. He was named editor of the *Roosevelt Encyclopaedia* in 1927 and was the author, joint author or editor of about 100 volumes. An outstanding authority on George Washington, he was chosen a member and historian of the U.S. commission for the celebration of the 200th anniversary of the birth of Washington, a task which was in preparation for six years before the 1932 country-wide festivities. Dr. Hart died in Boston, June 16. (See *Encyclopædia Britannica.*)

Hart, Lorenz (LARRY) (1895–1943), U.S. song-writer and musician, was born in New York city May 2. While a student at Columbia university, he met Richard Rodgers, then a freshman. Both were aspiring musicians, and they pooled their talents to produce the Columbia Varsity Show of 1920. This first effort was successful and gave birth to the famous Rodgers-and-Hart combination. Generally, Hart wrote the lyrics while Rodgers composed the music, but both were gifted in either specialty. They wrote the lyrics and music for more than 25 Broadway shows and for a number of motion pictures. Among their more prominent successes were: *Babes in Arms* (1937), *I'd Rather Be Right* (1937), *The Boys from Syracuse* (1938) and *I Married an Angel* (1938). Hart died in New York city Nov. 22.

Hartley, Marsden (1877–1943), U.S. painter, was born Jan. 4 in Lewiston, Me. He studied art at the National academy in New York city and later in Europe. Best known of his paintings are his landscapes and marines, "Fox Island, Me.," "The Spent Wave" and "Evening Storm, Schoodic, Me." After a period in the west painting rugged landscapes, he returned to Maine to do a series of church pictures, fishing scenes and other outdoor subjects. He spent a year in Mexico in 1930 on a Guggenheim fellowship and later did a series of mountain studies along architectural lines in New Mexico. Hartley died in Ellsworth, Me., Sept. 2.

Harvard University. Founded in 1636, Harvard is the oldest institution for higher education in the United States. Gifts during the academic year 1942–43 were $5,244,255. Scholarships and other student aids totalled

AFTER RECEIVING an honorary LL.D. at Harvard university Sept. 6, 1943, Winston Churchill delivered an extemporaneous address to 6,000 U.S. soldiers and sailors enrolled at the university

$779,731, exclusive of student loans. At the beginning of the academic year, July 1, 1943, the civilian student enrolment had fallen to less than 25% of the peace-time normal, but the university's facilities were fully occupied by more than 6,000 army and navy men sent to Harvard for specialized training in 11 different service schools. A great deal of wartime research was being conducted in the university laboratories. All departments of the university operated on a new intensified 12-month, 3-semester schedule. A notable event of the year was the conferring of an honorary degree on British Prime Minister Winston Churchill.

For statistics of student enrolment, faculty members, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Hassani, Mohamed Tageddine el SHIEK (1886–1943), Syrian jurist and politician, received his education in Damascus and Cairo. He gave up teaching for politics, entered the Syrian congress in 1919, became sheik of the Ulemas the next year and served as councillor of state and at the court of cassation, 1921–23. He was caliph of Damascus, 1924–28, deputy to the constituent assembly, 1928, and president of the council of ministers and minister of the interior, 1928–31 and 1934–36. He was proclaimed president of Syria in Sept. 1941, when the former French mandate was declared independent by agreement with the Fighting French. He died Jan. 17, according to a report from Beirut, Lebanon.

Hawaii. The territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18°55′ and 22°15′ N. and between 154°50′ and 160°30′ W. longitude. Their total area is 6,438 sq.mi. The islands are of volcanic origin. From southeast to northwest, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau over 1,100 mi. is an archipelago of rocks, reefs and shoals which includes Midway (longitude 177°22′ W.). Likewise, 960 mi. south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of 55 islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 sq.mi. The capital of the territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1940 census) of 180,986. The population of the territory (1940) was 423,330. The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 82% of the population is native born.

History.—Ingram M. Stainback took office as governor on Aug. 24, 1942, succeeding Joseph B. Poindexter. Joseph R. Farrington was territorial delegate in congress in 1943. Territorial tax collections on business and otherwise for the fiscal year ending June 30, 1943, amounted to $35,827,659, as compared to $27,215,950 for the previous year. Cash on hand and in banks increased by over 48%, while federal internal revenue collections increased from $32,067,927 in the fiscal year 1942 to $75,996,558 in the fiscal year 1943. This increase in federal collections was due to increased rates of taxation.

Agriculture.—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods and costly irrigation works raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of $66,482,181. Production of sugar in 1942 amounted to 870,109 tons. The pineapple industry, next in importance, produced approximately 21,190,000 cases of canned pineapple and pineapple juice for the year ending May 31, 1943. Because of the shipping situation brought about by the war, an extensive program of production of food crops for local consumption was under way. (B. W. T.)

Hawkes, Herbert Edwin (1872–1943), U.S. educator, was born Dec. 6, in Templeton, Mass. He graduated from Yale in 1896, took his Ph.D. there in 1900, and later studied at Goettingen university. He became instructor in mathematics at Yale in 1898 and advanced to assistant professor in 1903. Dr. Hawkes was appointed mathematics professor at Columbia in 1910 and was named dean in 1918—a post he held until his death in New York city, May 4, 1943.

Hay. The 1943 crop of hay in the United States was the second largest on record, only 5% smaller than the record 1942 crop. The 1943 crop was estimated by the U.S. department of agriculture at 99,543,000 tons compared to 105,295,000 tons in 1942 and a ten-year average of 82,952,000 tons. This total was divided as follows: tame hay 87,000,000 tons, including 32,000,000 tons of alfalfa, 29,000,000 tons of clover-timothy, 7,000,000 tons of annual legumes and 6,000,000 tons of lespedeza. These were about the usual proportions of each class. Wild hay yields were below those of 1942 and offset the increase in acreage cut. Total wild hay production was 12,279,000 tons compared to 13,088,000 tons in 1942 and a ten-year average of 9,675,000 tons. Alfalfa production for hay was 11% off from 1942 due to a reduction in the number of acres harvested. Clover-timothy hay increased in 1943 over 1942 by 2% and production was 25% above the ten-year average. Sweet clover hay, three-fourths of which is produced in the north central states, declined in acreage and production in 1943 by about one-third. Lespedeza hay was also below the record production of 1942. Pea, bean and peanut hays were increased by 400,000 to a total of 7,100,000 tons. Yields of both soybean and cowpea hay were below those of 1942 in all sections of the country. Other grain hays were increased about 5%. A production of 8,000,000 tons of millet, sudan and other minor hay crops represented a decrease of 4% compared to 1942.

Hayseed.—The total acreage of hays grown for seed in 1943 exceeded the area of 1942 by 7%. This was due to the price-supporting program, good weather and the fact that less labour is needed for harvesting seed than hay. But 1943 was not a good seed year and the dry summer in some localities held down yields below average. The high price of seeds encouraged growers to harvest some fields of low yields that would not have been saved under normal conditions.

The production of the principal kinds of hayseed was about 3% smaller than 1942 but 6% above the average. Alfalfa seed at 1,114,900 bu. was 15% larger than 1942 but below the ten-year average; red clover also yielded an increase over the past year, 1,142,900 bu. or 11% more than in 1942. This was chiefly due to 15% increase in acreage. Alsike at 238,900 bu. was 5% below 1942 and 25% below the average. Sweet clover produced the smallest crop since 1922 and only one-half the average. Timothy seed was 11% below 1942 estimated at 1,499,000 bu. and 6% below the ten-year average. Lespedeza was 6% below 1942 but 67% above the average. The total 1943 crop was 159,920,000 lb. compared with an average of 95,564,000 lb. (*See* also ALFALFA; SOYBEANS.) (J. C. Ms.)

Hayashi, Senjuro (1876–1943), Japanese army officer and politician, was born Feb. 23 at Ishikawa-Ken. He was a graduate of the Military academy, 1896, and the Military Staff college, 1903. He was later director

of both schools. At the outbreak of the Manchurian "incident" in 1931, Hayashi, then commander of Japanese forces in Chosen, marched his troops into Manchuria without waiting for authority from headquarters in Tokyo; a year later he was promoted to full general. In 1934 he was appointed war minister and made efforts to check the growing power of the clique that supported his predecessor, Gen. Sadao Araki, then scored for his fascist leanings. Gen. Hayashi retired from the war ministry in 1935 and was subsequently named to the supreme war council, but resigned early in 1936 after the assassination of Viscount Makoto Saito and other prominent statesmen by a mutinous band of junior army officers. He was premier from February to May 1937; the short life of his premiership was a sign of the growing ferment on the Japanese political stage. A Tokyo dispatch broadcast from Berlin, Feb. 4, reported his death.

Heart and Heart Diseases.

Interest was focused largely on (1) cardiovascular examination for military service with an attempt to define more accurately the criteria for admission to army and navy than had previously been done, and (2) diagnosis and disposition of cardiacs found in the service. One of the most interesting of the studies of 1943 was that of the re-examination of cardiovascular rejectees in five of the larger cities of the country. A group of approximately 5,000 men who had been rejected in 1942 because of a diagnosis of cardiovascular disease were re-examined, 1,000 each in Boston, Chicago, New York, Philadelphia and San Francisco. The aim of the examination was threefold:

1. To determine the percentage of possible salvage.
2. To compare the results of examination by doctors of the local boards and induction stations with those of cardiovascular specialists.
3. To identify and to study the particular problems that concerned all these groups.

Of the total of 4,994 cardiovascular rejectees examined, 863 or 17.3% were resubmitted as 1-A—18.8% in Boston, 3.9% in Chicago, 19.2% in New York, 16.5% in Philadelphia, and 28.6% in San Francisco. Chicago's yield was the least because of the fact, apparently, that cardiovascular experts had already been used freely in the initial examinations. San Francisco's was the highest because of the inclusion of a good many borderline cases, recognized as such. In Boston there was a large borderline group, of 11.4%, thought to be normal but not fitting the current criteria of the army manual of mobilization regulations. These borderline groups in particular, as well as the individuals resubmitted as 1-A, were to be the subject of follow-up study in future years.

The chief cause for rejection was rheumatic heart disease, making up about 60% of the final 4-F group. The second most common cause for final rejection was hypertension, making up 26% of the 4-F cases. The third cause of rejection was neurocirculatory asthenia, making up 5% of those labelled 4-F. The fourth condition responsible was sinus tachycardia with 4.5% of the final 4-F cases, and the fifth was congenital heart disease with a fraction less than in the tachycardia group. Other causes for rejection were few in number and included cardiac enlargement as discovered by X-ray enlargement alone, arrhythmias, cardiovascular syphilis (in only 17 cases), and coronary heart disease (in only 6 cases).

A review of the re-examination of these cardiovascular rejectees revealed eight problems of particular interest:

1. The interpretation of apical systolic murmurs.
2. The upper limits of blood pressure.
3. The limits of the normal pulse rate.
4. The heart size.
5. The electrocardiogram.
6. Neurocirculatory asthenia.
7. Recent rheumatic fever.
8. Exercise tests.

In brief, apical systolic murmurs may, if very slight or even slight, in the absence of any other abnormality, doubtful findings, or an authenticated history of rheumatic fever, be considered acceptable for service. The upper limits of normal blood pressure were listed as 160 systolic and 90 diastolic. The limits of the normal pulse rate were extended to 40 as the low and 120 as the high. It was also felt that heart size might be given a wider range, especially according to body build, and that minor variations of the electrocardiogram should not be cause for rejection. Neurocirculatory asthenia, on the other hand, even if very slight, was viewed as a cause for immediate rejection, and recent rheumatic fever too. Exercise tests were not found of much value.

One of the important problems that faced the army and navy during 1943 was the frequent occurrence of rheumatic fever in army camps and in naval stations where large numbers of young men were crowded together and exposed to haemolytic streptococcus infections. A small percentage of such men were practically certain to come down with rheumatic fever; although this figure was small so far as percentage was concerned, the absolute numbers of such men might be considerable. It was a real problem since rheumatic fever puts patients to bed usually for months at a time and is very likely to damage the heart. Whether or not to discharge cases of rheumatic fever from the service after recovery in the absence of heart disease was also a problem that concerned the medical services. Generally the custom was to discharge such patients, largely because of the threat of recurrent trouble in the future. It was also thought wise not to admit any man into the army who had an authenticated history of rheumatic fever within five years of the time of examination.

Advances in civilian medicine were somewhat retarded by the war but two or three important contributions should be mentioned. Lumbodorsal splanchnic sympathectomy for hypertension became established as by far the most promising therapeutic measure for serious hypertension in young and middle-aged persons that had been introduced. R. H. Smithwick's success in over 60% of the cases (followed now for from one to five years) quadrupled the success of the older procedures along this line. On occasion patients already showing effects of serious strain on heart, kidneys and arteries can be rescued, at least for the time being. The procedure is applicable in particular to those with high diastolic pressures, relatively small pulse pressures, and marked reaction to sedation, posture and cold.

Another comforting discovery during 1943 was the doubling of the expectation of life after the first attack of angina pectoris which resulted from a more adequate follow-up study than had ever been carried out before. A series of 497 patients who were seen for angina pectoris between 1920 and 1930 were reviewed in 1943. Fifty-two of these were still living with an average duration of life of 18 years after the first attack; 445 had succumbed with an average duration of life of 8 years. Including both living and dead cases, the average duration of the whole series was 9 years and this was expected to be increased a bit more before the conclusion of the follow-up study. This average prognosis, therefore, of 9 to 10 years was announced as an encouraging revision of the current statements of the average duration of life after the first attack of angina pectoris recorded as 4½ to 5 years in the medical textbooks.

Helicopter: *see* AVIATION, CIVIL.

Helium. Extensive additions were made to the helium production capacity of the United States, and it was known that reserves were adequate, but no specific information was made public because of the importance of the product in aviation with craft lighter than air. (G. A. Ro.)

Hemp. The 1943 crop of hemp for fibre in the United States was ten times larger than in 1942, amounting to 134,251,000 lb. compared to 13,922,000 lb. produced in 1942 and 2,901,000 lb. as the average for the ten years 1932–41. Prior to World War II only Wisconsin and Kentucky produced hemp in any quantity. The season of 1943 was unfavourable to hemp culture in Minnesota and Indiana where floods caused the abandonment of about 18% of the acreage.

The growing of hemp for the seed is chiefly confined to Kentucky and Tennessee. The acreage planted in 1943 was 57,700 ac., nearly 60% more than the 36,300 ac. of 1942. The total crop of seed in 1943 was estimated by the United States department of agriculture at 19,223,000 lb. or nearly twice the crop for 1942. The entire crop is under the control of War Hemp Industries, Inc. (J. C. Ms.)

Henderson, Leon (1895–), U.S. economist, was born in Millville, N.J. on May 26. In 1917 he entered the U.S. army as a private, attaining the rank of captain of ordnance by 1919. In 1920 Henderson returned to Swarthmore college, where he received his B.A. degree. During the early New Deal era, he served as consulting economist to the Work Projects administration. In 1939 he was appointed to the Securities and Exchange commission.

On April 11, 1941, President Roosevelt created the Office of Price Administration and Civilian Supply (later renamed the Office of Price Administration, *q.v.*) and placed Henderson at its head as price administrator. Henderson accepted the appointment and in July 1941 resigned his post with the SEC. In Jan. 1942 he was made head of the civilian supply division of the War Production board.

Henderson predicted that his efforts to impose rationing and other restrictions on Americans would make him the most unpopular man in the United States. In Dec. 1942, as his prophecy seemed to be approaching fulfilment, he resigned from both the WPB and the OPA. The latter resignation was to take effect upon the appointment of a successor; on Jan. 18, 1943, Prentiss M. Brown was named to succeed him, and on Jan. 20 he turned over his duties to Brown. On May 12, 1943, he joined the Research Institute of America as chairman of the board of editors.

Heward, Leslie Hays (1897–1943), British musician and composer, was born Dec. 8 in Liversedge, Yorkshire. An infant prodigy, he was a church organist at the age of eight and assistant organist at the Manchester cathedral at 18. He won a composition scholarship at the Royal College of Music in 1917, was made music master at Eton college in the same year, and later became music director of Westminster school. He was named conductor of the British National Opera company in 1922 and two years later went to South Africa to direct the Cape Town Municipal Orchestra and the Cape Peninsula Broadcasting association. When he returned to England in 1927, he resumed his former post with the British National Opera but a few years later joined the City of Birmingham Orchestra, also as conductor, a post he held until his death. Heward died in Birmingham, May 3.

Hewitt, Henry Kent (1887–), U.S. naval officer, was born Feb. 11 in Hackensack, N.J. A graduate of the U.S. Naval academy, 1906, he was commissioned an ensign in 1908. He won the naval cross for distinguished service in World War I, and later served as commander of a destroyer division. He was inspector of ordnance in charge of the naval ammunition depot at Puget sound and commanded the cruiser "Indianapolis," on board which President Roosevelt sailed for South America in 1936. He was promoted to rear admiral in Dec. 1940.

Adm. Hewitt was named to command the U.S. naval units in the huge Allied fleet that protected the U.S. landings in North Africa Nov. 8, 1942. Shortly after these landings Adm. Hewitt commanded the naval engagement that helped force the surrender of Casablanca. In recognition of his services in North Africa he was made a vice-admiral in Nov. 1942.

Adm. Hewitt's fleet also played its part in the Sicilian campaign in 1943 and in the attack on the Italian mainland, particularly the landings at Salerno.

Hilbert, David (1862–1943), German mathematician, was born Jan. 23 in Koenigsberg. He studied at the Universities of Koenigsberg, Heidelberg, Leipzig and Paris and in 1895 began his life-long association with the University of Goettingen as professor of mathematics. He made basic investigations in all the major branches of pure mathematics, among which were his geometric spaces of infinitely many dimensions, his algebraic basis theorem, and his minimum condition in the calculus of variations. He was also the leader of the formalist school in mathematical logic which believes that all mathematics can be developed from sets of axioms. Hilbert's work on infinitely many dimensional spaces was applied by others to quantum mechanics. He died in Goettingen, according to a Berne dispatch of Feb. 19.

Himmler, Heinrich (1900–), head of the German police and founder of the *Schutzstaffel*, was born Nov. 7 at Munich. At the University of Munich, he specialized in agriculture. In later life he became a member of the Academy of German Law. From an insignificant beginning he rose steadily to power in the Hitler political revolution. Although a participant in the abortive Munich beer hall putsch in 1923, he escaped imprisonment. In 1927 he became deputy leader of the German S.S. (Black Shirts), expanded to offset the power of the Brown Shirt troops, and was made leader in 1929. The fuehrer never had a more loyal or ruthless devotee. Himmler served as reich director of propaganda from 1926 to 1930, became a member of the reichstag and the Prussian state council in 1933, commander of the united German police forces in 1936 and deputy head of the reich administration in 1939. During 1942 he was sent by Hitler to various occupied countries to quell anti-nazi resistance, working closely with his pupil and lieutenant, Reinhard Heydrich, later assassinated in carrying out a program of wholesale executions among subjugated peoples. In 1943, Allied successes engendered defeatism on the home front and led to increased activity by resistance groups in the occupied countries. Himmler's reply to growing anti-naziism at home and in

the conquered areas was more executions. Determined to crush all opposition to his regime, Hitler named Himmler minister of the interior, Aug. 24. The Gestapo chief attempted to brace German morale by execution of civilians for "defeatist utterances," and used customary terror technique to stamp out revolt in the occupied countries.

Hinsley, Arthur (1865–1943), British cardinal, was born Aug. 25 in Selby, Yorkshire, England. Educated at Ushaw and at the English college, Rome, he taught school and was rector of a London parish until 1926, when he was consecrated bishop. He was sent to Africa as Visitor Apostolic to Catholic missions and there contracted paratyphoid which seriously affected his vision and hearing. He retired in 1934, but the death the following year of the incumbent archbishop of Westminster left England's Catholics without a ruling prelate for the jubilee of King George V. Consequently Hinsley was called out of retirement and named archbishop of Westminster; in 1937 he was made cardinal. Outspoken on political matters, he criticized the negative stand of Pope Pius XI on the Ethiopian invasion. He despised Germany's national-socialism, denounced the Hitler party as "pagan upstarts" and, although no friend of communism, paid frequent tribute to the Russian people for their defense of their homeland. Cardinal Hinsley died in Hertfordshire, March 17.

Hispanic America and World War II.

The record of 1943 showed two additional Hispanic American countries added to the list of those at war with the axis powers. Bolivia entered the war on April 7, 1943, mainly as a gesture showing solidarity of the current administration with United Nations policies. The move also made logical the mobilization of labour in the production of tin and other strategic materials. The other nation to declare war on Germany was Colombia, which took the step on Nov. 27, following the sinking of a Colombian vessel by a submarine (the second incident of this kind). In both cases the war declaration was followed by the usual sequestration of axis-owned funds and property and detention of enemy aliens, and beyond this occasioned little change in policy.

Greater interest was concentrated on the development of affairs in Chile and in Argentina, at the beginning of 1943 the only two states in the western hemisphere which had not yet broken off relations with the axis. Definite pressure toward the severance of relations had been maintained throughout 1942 by the United States, and in Chile there had been a steady trend in this direction. President Juan Antonio Ríos had moved cautiously, however, and not until Jan. 20, 1943, did he consider that the time for rupture of relations had arrived. Following the break, a report that Chilean diplomatic representatives in the far east were being improperly treated resulted in confinement for a time of Japanese representatives in Chile. The abandonment of isolation by Chile was shortly followed by new lend-lease arrangements (March 2), and in June by a new copper purchase agreement with the United States.

In Argentina the Castillo administration stubbornly refused to abandon neutrality, in spite of charges of axis espionage which led to the requested recall of the German military and naval attaché and a brief suspension of communication with axis countries. During the spring the administration began preparations for the next election, with some trend away from the conservative and toward the moderate, liberal body of public opinion. On June 4-5 a well organized revolution, headed by Generals Arturo Rawson and Pedro P. Ramírez, deposed President Ramón Castillo and took over control. Apparently under the impression that a breakaway from isolation would follow, the new administration was promptly recognized by the United States and other United Nations powers, but the new government proved for the time being even more nationalistic than the preceding one. General Rawson, who favoured a break with the axis, was replaced by General Ramírez, and strict censorship over every expression in the press of pro-Allied sentiment was established. The new government inaugurated a program designed to win internal support (*see* ARGENTINA), but had serious difficulties with labour, student groups, and, eventually, financial interests. One attempt was made to gain lend-lease assistance from the United States, but it was promptly refused on the ground that Argentina was not co-operating properly in maintaining hemisphere safety. By the end of 1943 the Ramírez administration was faced with the alternatives of continuing isolation, with an increasing commercial and diplomatic pressure from the United Nations and a possible revolt at home, or of finally breaking with the axis.

In one other case in the Americas pressure was applied by the United States toward removal of a danger spot. In the French colonies in America the administration, while nominally independent, was still loyal to Vichy France. In Nov. 1942, the United States broke off diplomatic and commercial relations with Martinique and French Guiana, and the areas were thus deprived of foodstuffs and other needed resources. In March a revolution placed French Guiana on the side of the French authorities opposed to the axis, and in June Admiral Georges Robert retired as governor of Martinique, to be replaced by an appointee of General Henri Giraud (Henri Etienne Hoppenot).

In general during 1943, administrations in power in Hispanic America remained in control. One break in the ranks occurred. On Dec. 20, 1943, the administration of President Enrique Peñaranda of Bolivia was unseated by a revolution headed by

THE ONLY "PAN-AMERICAN RAT HOLE" in 1943, according to Bishop of the *St. Louis Star-Times*

Victor Paz Estenssoro and supported by parties which had a pro-fascist reputation. All through the year attacks in the Bolivian congress on the administration had been frequent and bitter, the most serious charges being connected with the use of military force in repressing strikes in the tin industry in Dec. 1942 (an investigation in the spring of 1943, made by a joint Bolivian-United States commission, indicated that conditions in the industry did need some attention). While the new administration (under President Gualberto Villarroel) pledged support of all commitments made by Bolivia to the United Nations program, the previous allegiances of the leaders of the revolution, and a suspected connection with the reactionary Ramírez group in Argentina caused the United States and other American states to withhold recognition of the new government.

In other respects the general program of inter-American defense was carried out along lines already laid down. The construction of naval and air bases from Ecuador to the Bahamas moved toward completion, in some cases causing concern over unemployment when the special construction ceased. Two of the nations at war gave indications that they were seriously considering actual participation in military campaigns. Brazil, already doing a workmanlike job of patrolling offshore waters, and with at least a half dozen submarines credited to its air service, officially planned sending an expeditionary force to the European sector, and news reports stated that Brazilian officers were in the field gaining experience. Cuba likewise was organizing a volunteer corps for overseas duty (its conscripts are liable only for service in Cuba). At least one press report hinted at possible Mexican participation in the future, along similar lines. Control of communications and some supervision of war items in news publications were also exercised through 1943. In a few cases, as in Ecuador, import quotas were used to direct the flow of essential goods.

The year saw fewer western hemisphere conferences than in 1942. The regular International American (Pan American) conference, scheduled to meet in Colombia late in the year, was indefinitely postponed; this followed the precedent set in World War I, and in any case the machinery of co-operation between American nations was well enough organized to function without the formal meeting. Some visiting by prominent persons occurred, as when Vice-President Wallace of the United States made a South American trip in April, and when the presidents of Bolivia, Paraguay, Haiti and Colombia visited the United States. The chief executive of Costa Rica visited several neighbouring states, and other contacts were made in hemisphere relations by military leaders, executives, experts and diplomatic representatives. Some inter-Hispanic American commercial agreements were signed; probably the most important of these was a set of conventions arranged between Chile and Argentina which it was hoped would be the basis for a future customs union taking in several nations in the area. The United States was a party to a number of inter-American conventions; in three cases these concerned the continuation of currency stabilization funds (Mexico, Cuba and Ecuador). In June a new copper contract was signed with Chile, and other agreements concerning the purchase or development of production of strategic materials were either continued or established (at least three were worked out with Brazil alone). Economic planning was undertaken as in the setting up of a joint United States-Mexican Economic commission (announced in April), and the inauguration of a Bolivian Development commission and of an Economic Defense plan in Colombia. The comprehensive food production program for the Caribbean, under the general direction of the United States Board of Economic Warfare, was carried ahead.

As the year passed, postwar planning received increased attention.

In internal politics 1943 was generally quiet, except in those cases already noted. The year was not a presidential election year, although in several states, such as Cuba, Costa Rica and Ecuador, parties were active in preparation for 1944. In Panamá the chief executive was continued in office without election because of war conditions. Chief executives in most cases continued to exercise extraordinary powers, either by virtue of special legislation or by continuation of a state of siege. The dissolution of the World Communist party, in June, caused some reorganization of national Communist parties in those states where these had strength (notably Chile and Costa Rica). A trend toward nationalization of foreign-owned corporations, particularly where concerned with utilities, was apparent with the opportunity toward purchase offered by a favourable exchange situation.

Throughout Hispanic America there was a definite increase in the cost of living during 1943. The generally favourable export situation, combined with a shortage of consumer goods, forced up price levels, and price controls were not always too effective. Rationing of at least some items was in effect in most Hispanic American states. The shipping situation was definitely improved over 1942, which offered some relief, but some goods, such as fuel, some types of machine parts and certain manufactured articles, were simply not available. In some sections there was much concern over inflation. In the field of trade there was a notable increase in the net export balance of the American republics in their trade with the United States. The total for both merchandise and gold and silver, through September, amounted to $404,372,000; where favourable balances existed, they ranged from $143,000 for Costa Rica to $103,518,000 for Cuba. Only with Panamá, Honduras and Venezuela did the United States itself have a favourable balance. The volume of Mexican trade was estimated at 259% compared with 1942 (Nicaragua 225%, Haiti 175% and several above 100%). Hispanic American bonds likewise rose in value, with a tendency toward resumption of bond service where this had been discontinued. Credit and collections were generally rated as good. Currencies were strong in most states; one new unit appeared with the establishment of the "guarani" in Paraguay, replacing the peso.

Few areas suffered from unemployment, because of war demands, and both Mexico and the Bahamas sent labourers to the United States.

Hitler, Adolf (1889–), German statesman, was born at Braunau on the Inn, Austria, April 20. For his career prior to 1943 see his biography in *Encyclopædia Britannica.*

Fear that the German home front was cracking at the seams impelled Hitler in 1943 to alter his propaganda tack, substituting for the customary promises of a short war and *lebensraum,* the grim alternative of "win or die." He boasted on March 30 that his armies would fight on until "unequivocal victory" had been won, but warned the Germans that they would become "red slaves" if they lost. The German victories at Kharkov and Belgorod in March established the basis for his declaration on March 21 that the crisis on the Russian front had been overcome; he also spoke of measures that would guarantee "final victory." But in April, he was faced with a new crisis—the impending collapse of axis armies in Africa—and he conferred with Mussolini, presumably on measures to salvage what they could from Africa and prepare to meet new Allied blows. The two dictators conferred again on July 19; six days later Mussolini was overthrown. By September, Italy had surrendered to the Allies and Hitler complained, Sept. 10, that he was a victim of Italian "deception" and vowed vengeance on Pietro Badoglio, Mussolini's successor, for his "treachery." In the autumn of 1943, German cities were being scourged from the air, and German soldiers were again in retreat on the Russian front. On Oct. 8, Hitler appealed to his people not to be discouraged by these reverses. But defeatism was growing on the home front and, a month later, the fuehrer warned that he would resort to mass executions to prevent an internal collapse. His last two speeches of 1943, on Nov. 29 and Dec. 31, were gloomy and desperate. His strident boasting could no longer conceal a subconscious and gnawing premonition that Germany was facing disaster, and again he warned that Germany must win or face total destruction. Throughout 1943, there were recurring reports that the German generals were awaiting the opportune moment to overthrow the fuehrer and seek a negotiated peace with the Allies. (*See* also GERMANY.)

"THAT FORTRESS OF EUROPE," pictured in 1943 by Russell of the *Los Angeles Times*

Hobby, Oveta Culp (1905–), U.S. director of the Women's Army corps (WAC) (*q.v.*), was born Jan. 19 in Killeen, Tex. A graduate of the University of Texas Law school, she was successively a member of the Texas legislature, assistant city attorney of Houston and a bank director. She also helped codify Texas banking laws and was the author of a text on parliamentary law. In 1931, she married William Pettus Hobby, former governor of Texas, and took an active interest in his newspaper, the *Houston Post,* becoming executive vice-president. In 1941, Mrs. Hobby was called to Washington on a dollar-a-year job as chief of the women's interests section of the war department's public relations bureau. At the behest of General Marshall, she drafted plans for a women's army and on May 16, 1942, she was sworn in as director of the first force of this kind in United States history, with a rank equivalent to that of a major. Starting with a goal of 12,200 women in uniform, the corps was subsequently authorized to expand to 150,000, in order to release more men for service on fighting fronts. At the end of the first year, members were serving in 225 army posts. In July 1943, WAAC became WAC; the word "Auxiliary" was dropped and the corps became an integral part of the army. Mrs. Hobby, as colonel, continued in command.

Hockey: *see* ICE HOCKEY.

Hoffman, Paul Gray (1891–), U.S. industrialist, was born Apr. 26 in Chicago. He attended the University of Chicago, 1908–09, and went to Los Angeles in 1911, where he worked as an automobile salesman for the Studebaker corporation. During World War I he was a lieutenant in the field artillery, and after he was mustered out he returned to Los Angeles and founded the Paul G. Hoffman company, a motorcar distributing agency. He was Studebaker's vice-president in charge of sales, 1925–31, and was named president of the Studebaker Sales Corporation of America, 1931. During the depression years the big auto plant went into receivership. It was reorganized, and in 1935 Hoffman was made president of the firm. Under his guidance Studebaker not only was put back on a solid financial basis but was competing successfully with the giant auto combines in Detroit in producing medium-priced motorcars.

In 1937 he was elected to the board of trustees of the University of Chicago. In 1942 he became a federal reserve bank director. Hoffman was the leading spirit in the organizing in Sept. 1942 of the Committee for Economic Development (*q.v.*), of which he became chairman. In June 1943 he became a director of United Air Lines and of *Encyclopædia Britannica.*

Hogs. The year 1943 began with an all-time record number of hogs on farms. The total of 73,660,000 head on Jan. 1, as estimated by the United States department of agriculture, was 22% or 13,283,000 head more than in 1942 and 4,356,000 head more than the previous high record of 1923. The average for the ten-year period 1932–41 was 51,508,000 head. The spring pig crop was estimated at 74,000,000, which was 22%

larger than the 1942 spring farrowings. The fall pig crop was forecast to be 53,000,000 head, making a total of 127,000,000 head compared to 105,000,000 head in 1942 and 73,148,000 head as the ten-year average. These pigs were fed to heavy weights and brought a large increase in pork and lard to set a new record. The large spring pig crop resulted in a heavy utilization of feed, particularly corn, because the price of corn and hogs made it greatly to the farmers' advantage to feed corn to hogs rather than to market it as corn. This also led to the feeding of hogs to the maximum weights and also created a scarcity of corn for industrial uses and for purchase by livestock feeders outside the corn belt.

The slaughter of hogs in 1943 was estimated to be 93,200,000 head, compared to 77,900,000 head in 1942. Since the fall pigs and part of the spring pigs are marketed in the following year, the full increase in the fall pig crop of 1943 was not shown in the slaughter figures, but would be reflected in market receipts in 1944. The total hog slaughter was the highest on record, though the peaks of 1923 and 1933 were near the total of 1942. The capacity of the packing plants was taxed to the limit and at many markets receipts of hogs during the late months of 1943 made embargoes necessary since the packing plants could not handle the large numbers offered for sale. Hog prices remained quite steady through the year until the early fall when receipts at the markets became heavy. The government issued several appeals to farmers to hold hogs on the farms until the stockyards could be cleared. The War Food administration stated that the demand for pork exceeded the supply and that the government would purchase for lend-lease and other uses at prices that would reflect $13.75 per 100 lb. at Chicago.

The shortage of feed in prospect led the government to plan goals for 1944 on a somewhat reduced scale. A spring pig crop of 62,000,000 head and a fall crop of 43,000,000 head, or a total of 105,000,000 head was recommended. This number was expected to meet the food requirements of 14,790,000,000 lb. of pork and lard, of which 7,320,000,000 lb. was for civilians and 5,170,000,000 lb. for noncivilians, with 2,300,000,000 lb. as reserve and carry-over to the next year. Home Building, Federal: *see* NATIONAL HOUSING AGENCY.

Home Economics.

Home economics activities in the United States were centred in national organizations and in federal agencies. During 1942–43 the work of all was focused on wartime needs.

The American Home Economics association, at a wartime institute held in lieu of an annual meeting, considered how home economists might help families to strengthen homes in war and postwar periods. Three problems were discussed: managing finances in a war and postwar period, mobilizing human and material resources, and maintaining and creating values for families.

Representatives of the division of family relations and child development of the association worked on plans that might induce states, and through them smaller localities and communities, to help families readjust to wholesome relationships in the postwar period. During the war year of 1943, the major emphasis was to see that child care centres were provided.

The Association of Land-Grant Colleges and Universities reported that wartime adjustments made in home economics college programs included: modification of courses, with increased attention to the conservation of food, clothing, furniture and equipment, methods of saving time and energy, and problems created by working mothers and broken homes; accelerated programs and refresher courses, particularly in nutrition; help with local and state programs; and the redirection of research, with emphasis on nutritive value and food preservation. The demand for home-economics-trained women far exceeded the supply.

The home economics education service (U.S. office of education, Federal Security agency) listed among the changes brought about by the war in the grade and high school programs: more emphasis on food conservation; the training of child-care aides; more instruction in home nursing and first aid; education in rationing and price ceilings; inclusion of nutrition in the elementary program; and less formal teaching in adult classes.

About $5,000,000 of federal funds were expended for the promotion and development of education for the vocation of homemaking. Approximately 18,000 high schools, about half of them federally reimbursed, offered instruction in home economics; approximately 350 teacher-training institutions, about one-third of them federally reimbursed, prepared home economics teachers.

The co-operative extension work in agriculture and home economics (War Food administration), a co-operative educational undertaking of the U.S. department of agriculture, the land-grant colleges and county governing bodies, was made a part of the War Food administration. This bureau was given the responsibility for educational programs dealing with war food production and conservation. More than 7,500,000 rural women enrolled in this program. The American Institute of Public Opinion reported that in the U.S.A. 24,800,000 families, or 75%, did some canning and put up 4,100,000,000 containers of all sizes; this is about 165 containers per family.

The bureau of human nutrition and home economics (Agricultural Research administration, U.S. department of agriculture) in its home economics research, investigated more problems in food and nutrition than in other fields. Many of the scientific data were interpreted in popular publications to help homemakers adjust to wartime supplies and shortages. There were pamphlets on meat; food preservation and waste; vitamins; fats and vegetables in wartime meals; and on the care of equipment, clothing, household textiles and rubber goods. Of the 113 available publications, more than 28,000,000 copies were distributed directly.

The office of experiment stations (Agricultural Research administration, U.S. department of agriculture) administers specified federal grants assigned to agricultural experiment stations for research, which may include home economics. In 1943–44, 39 states received federal support for 161 home economics projects, of which 134 were in food and nutrition. Forty-six stations and two other agencies participated in the national co-operative project, conservation of nutritive values of foods. Home economics took the lead, with representatives from 38 states.

The stations continued and extended studies on the standard allowances of nutrients established by the National Research council. Home economists made use of their strategic positions in land-grant institutions to work on nutrition problems requiring human beings as subjects. (*See* also DIETETICS; FOOD RESEARCH.)

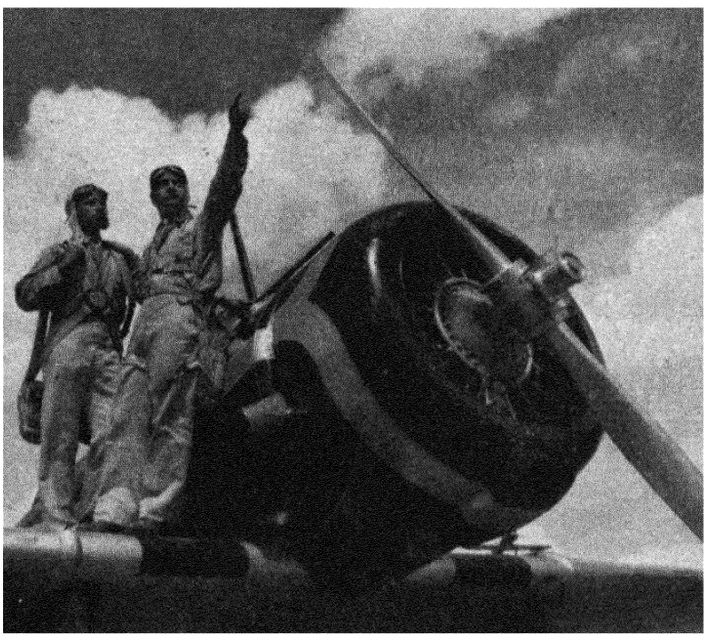
Honduras. A republic of Central America, bounded by Guatemala, El Salvador and Nicaragua. Area 59,145 sq.mi.; pop. (1940 census) 1,107,859. The 1940 census listed 20,327 persons as white, 105,752 as Indian, 957,135 as mestizo and 24,200 as Negro. Most of the population is classed as rural (71%). Capital: Tegucigalpa (47,223); other cities: San Pedro Sula (20,392); La Ceiba (11,293); Choluteca (5,057). Religion: Roman Catholic; language: Spanish. President in 1943: General Tiburcio Carías Andino.

History.—In 1943 the war continued to be felt more seriously in Honduras than in any other Central American country. The banana industry, furnishing ordinarily 65% of Honduran exports and a great part of government income, remained at about one-fourth of normal output, with resulting unemployment and financial shortages. In the latter part of the year six vessels were added to the banana fleet, with some improvement of conditions. The United Fruit company planned hemp plantings as a substitute crop and also established an agricultural school to study the problem. One firm, producing dehydrated banana products, increased its output to full capacity. Work on the Inter-American highway project and other strategic roads eased unemployment to some extent. In June a financial mission was sent from the United States to aid in solution of Honduran problems.

Transportation difficulties became greater during the year, because of shortages of fuel, tires and equipment. Freight cars were added to passenger trains to conserve fuel, and bus and truck facilities were reported as 50% below normal. At one time on the north coast there was complete lack of gasoline.



By July 1943 Honduras had sent 25,191 lb. of rubber to the United States to aid in the war effort.

Education.—Elementary schools in 1940 numbered possibly 1,000, with an enrolment of 51,900. Secondary schools numbered 11, with an enrolment of approximately 2,300. The National university at Tegucigalpa had an enrolment of 300. In the 1942–43 budget, education received 918,000 lempiras (1941–42: 761,000 lempiras).

Finance.—The monetary unit is the lempira (value in 1943 approximately 49 cents U.S.). In the 1942–43 budget expenses were estimated at 12,222,000 lempiras; revenue at 12,542,000 lempiras (revenue in 1941–42 was 11,499,000 lempiras; expenses: 11,647,000 lempiras). Importation and use of $1,500,000 in U.S. currency was authorized March 18.

Trade.—No late figures on Honduran trade were available. Banana export (normally 65% of all exports, and 13,438,935 stems in 1940–41) remained low, although increased toward the end of the year. Silver is second in export (1940–41: 3,037,559 kgs.). In the first half of 1943, export of precious metals (silver and gold) was valued at $1,104,672. Other items in normal Honduran trade are coco-nuts, coffee, tobacco, cattle.

Communication.—Railway mileage is 903.4 mi., with 839.9 mi. of fruit company road. Motor roads amount to some 500 mi. Internal air service is well-organized, and there is connection with the outside world by air and steamer. (D. RD.)

FLIERS OF HONDURAS were on daily patrol of the republic's Atlantic coastline in 1943, in co-operation with the U.S. anti-submarine forces

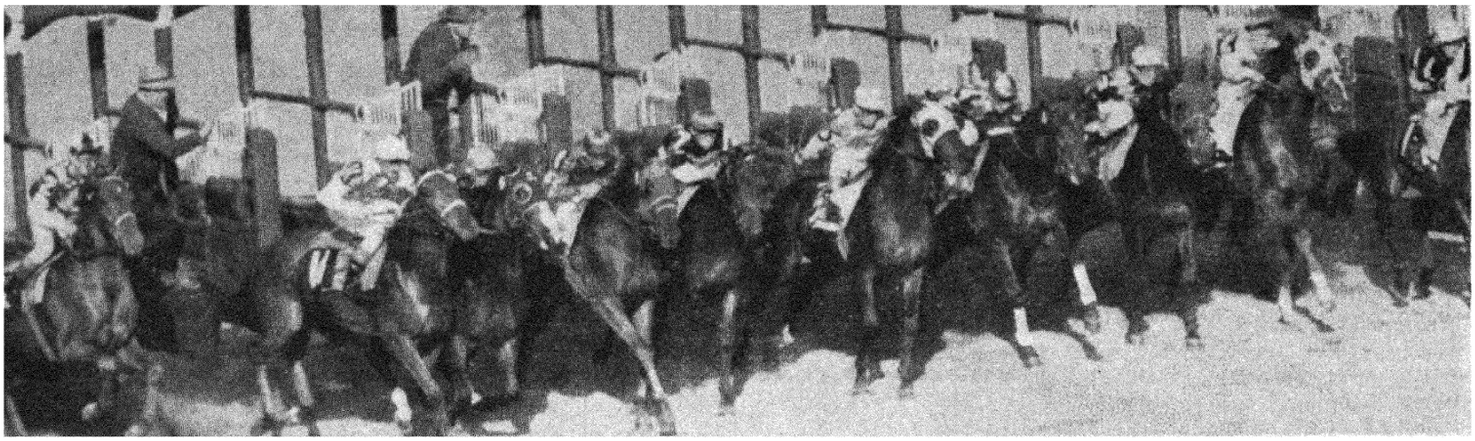
Hopkins, Harry L. (1890–). U.S. politician, was born Aug. 17 in Sioux City, Ia. After graduating from Grinnel college in 1912, he went to New York city to engage in social service work. He later became a fast friend of Franklin Delano Roosevelt, then governor of New York, who in 1933 appointed him federal administrator of emergency relief. From 1935 to 1938 he was administrator of the Works Progress administration. He was appointed secretary of commerce in 1938 but resigned in Aug. 1940 because of ill health. In Jan. 1941, he was sent to London as President Roosevelt's personal emissary to study the war situation at first-hand. On March 27, 1941, the president named him lend-lease co-ordinator. He went to London on a second mission in July 1941, going thence to Moscow. The next month he retired as lend-lease administrator, being succeeded by Edward R. Stettinius, Jr.

On Jan. 10, 1943, President Roosevelt appointed Hopkins head of the newly formed Russian Protocol committee. In May Hopkins was appointed to the advisory committee of the Office of War Mobilization. He accompanied Roosevelt to the international conferences at Casablanca, Quebec, Cairo and Tehran.

Hops. The production of hops in the United States as estimated by the United States department of agriculture was 42,297,000 lb. in 1943, compared to 35,153,000 lb. in 1942 and above the ten-year average of 1932–41, 37,992,000 lb. In Washington the crop of 15,207,000 lb. was the largest on record. Because of a decrease in acreage the Oregon crop was below average while in California the crop was above last year's as well as above the average. Favourable weather for harvest aided the pickers and few hops were left unpicked. A large part of the crop was harvested by machines this year. Yields were better than expected and quality was good.



U.S. Production of Hops by States, 1943, 1942 and 10-yr. Average

State	1943 lb.	1942 lb.	10-yr. average lb.
Washington	15,207,000	11,788,000	9,594,000
Oregon	14,450,000	13,124,000	18,763,000
California	12,640,000	10,241,000	9,635,000

Horse Racing. Racing in the United States in 1943 reflected the general conditions surrounding it. The immensely increased circulation of money caused by the

START OF THE KENTUCKY DERBY at Churchill Downs, Louisville, Ky., May 1. Count Fleet was the winner

war effort, combined with a public living under high tension and avid for excitement sent greater throngs of people to the race tracks than ever before. Despite the ban on pleasure driving, not relaxed until well into the summer, and in some sections, the fall, the national attendance was record-breaking, while the wagering reached figures described as "astronomical." As high as $2,926,-702 was bet on a single day at one of the New York tracks, the great centre of the sport. The national total for the year approximated $700,000,000, as a result of which a taxation revenue accrued to some 15 different states of about $35,000,000—in New York alone the amount exceeded $19,000,000. This led to the distribution, in stakes and purses, of the largest amount ever raced for in a single year, $18,547,635, as against the previous record of $18,136,118 in 1942.

The richest single race run was the Kentucky Derby, which netted the winner, Count Fleet, $60,725. This three-year-old colt at the close of the season was unanimously voted the "horse of the year." Bred and owned by Mrs. John D. Hertz and a son of Reigh Count (Kentucky Derby winner in 1928) and Quickly, by Haste, he was undefeated in six races, all his starts, and earned $174,055. His victories included the "Triple Crown" of Kentucky Derby, Preakness and Belmont stakes, all won in effortless style. Otherwise the honours and the money were much more widely scattered than usual, there being a lack of really dominant horses in the other divisions.

The champion two-year-old, Occupy, bred and owned by John Marsch and by Bull Dog—Miss Bunting, by Bunting, won $112,-949. The leading money-winner among the older horses was the four-year-old Thumbs Up, by Blenheim 2d—Gas Bag, by Man o'War, whose credit was $97,100. These figures are in sharp contrast to those for 1942, when three different horses each won over $200,000. The same condition extended over into the domain of speed. Not a single time record of importance was either beaten or equalled during the entire year and it was the general remark that the horses, as a lot, were slower than usual.

Among the winning stables, that of Calumet Farm (Warren Wright) took the honours with 73 races and $267,915; its trainer, Ben Jones, thereby taking the lead in his department, from the money standpoint. But from that of number of races won, the title once again went to Hirsch Jacobs with 128, this being the tenth time in the past 11 years that he has held the lead. The leading race-winning jockey was Johnny Adams with 228, he having also led in 1942 with 245. Among the money-winning jockeys the leader was Johnny Longden, whose mounts accounted for $573,276 in stakes and purses. The leading money-winning sire was the stallion Bull Dog, whose get won $367,771.

One of the features of the year was the great upturn in thoroughbred values as shown by the yearling sales, where an average of $1,868 was registered, as against but $636 in 1942; with the highest price paid $66,000 as against but $9,000 in 1942. A grand total of $2,074,736 was paid for 1,370 animals of all ages sold at auction, with an average of $1,514, as against one of but $489 for 1,914 sold in 1942. The stimulus to breeding as well as racing was, therefore, equally great. On the harness racing side governmental restriction worked greater hardships than on the thoroughbred, as before causing the cancelling of many of the most important meetings. Otherwise the season was one of unusual success at both the major and the minor tracks. The big winner of the year was the three-year-old Volo Song, by Volomite-Evensong, by Nelson Dillon, who took the annual Hambletonian stake, worth $42,298; his best heat being in 2:02½ (one mile). He was owned by W. H. Strang, Jr., and trained and driven by Ben White. Values for trotters took a big upward turn and a new record of $15,500 for a Standard-bred yearling was established at the annual sale of Walnut Hall Farm, where Volo Song was bred. (J. L. He.)

Great Britain.—Horse racing in 1943 was again severely restricted on account of transport difficulties, Ascot, Windsor and Salisbury in the south and Stockton and Pontefract in the north, in addition to Newmarket, being the only racecourses used. The wartime classic races were all run at Newmarket and proved that the three-year-old fillies were better than the colts. Lord Derby's filly Herringbone, by King Salmon—Schiaparelli, trained by W. Earl and ridden on each occasion by H. Wragg, won the One Thousand Guineas and the St. Leger, and J. V. Rank's filly Why Hurry, by Precipitation—Cybiane, trained by N. Cannon and ridden by C. Elliott, was successful in the Oaks. Lord Rosebery's filly, Ribbon, was narrowly beaten in each of these three races. The Hon. Dorothy Paget won the Derby with Straight Deal, a colt by Solario—Good Deal, who was trained by W. Nightingall and ridden by T. Carey, and also owned the best two-year-old of the season in Orestes, a colt by Donatella II—Orison, who was unbeaten. Kingsway, by Fairway—Yerna, owned by A. E. Saunders and trained by J. Lawson, won the Two Thousand Guineas, in which he was ridden by S. Wragg. The best of the older horses were Ujiji, winner of the Gold Cup, and Shahpoor, who won the Jockey Club Cup. Linklater proved himself the best sprinter of the year when he again won the Nunthorpe Stakes at Newmarket. G. Richards was once again champion jockey with 65 victories, and during the season he beat F. Archer's record of 2,749 winners that had stood since 1886. Miss D. Paget headed the winning owners with £13,145 won in stake money, and W. Nightingall was the most successful trainer. (A. K. B.)

Horses. The number of horses and colts on United States farms declined about 2% in 1942, a continuation of the steady decline since 1915. The total number was estimated by the department of agriculture on Jan. 1, 1943 at 9,678,000 head compared with 9,907,000 head in 1942 and 11,409,000 head as the average for 1932–41. The record number in 1915 was 21,-431,000 head before the widespread use of autos and tractors began on farms. There was a sharp drop in the number of horse colts raised on farms in 1942 the total being the smallest in 24

years of record. The decline was most noticeable in the central states Indiana, Illinois, Ohio, Iowa, and Michigan where farm power machines are most universally used. In New England, the southeast and far west there was little change. Gasoline rationing was expected to stimulate the return of the horse but there was no evidence that it had much effect. The scarcity of horse drawn vehicles was a retarding factor as well as the lack of facilities to take care of horses in cities, and moreover the slow speed of horse travel. Light horses for riding and showing showed little change since the interest of the people was so fully taken by other activities.

The army's requirements for horses were smaller than expected and were quickly supplied by the western range breeding farms. Range bred animals were plentiful and best suited to this work. The average value of horses increased slightly in 1942 to $79.97 per head as the average on Jan. 1, 1943 from $64.75 per head on Jan. 1, 1942, and the record of $99.18 per head in 1937. The total value of horses was $773,917,000 in 1943 compared to the record low value of $641,520,000 in 1942.

The use of horse meat was limited to the making of special foods for dogs and other pets. The use of horse meat for human food had always been very limited in the United States and showed no signs of increasing after the war began. From 15,000 to 30,000 animals were slaughtered each year from 1933 to 1943 and the higher price of feed caused the marketing of more than 40,000 in 1943.

Mules.—The number of mules declined 3% in 1942. The estimated total number of mules on farms was 3,712,000 head on Jan. 1, 1943, compared with an average of 4,542,000 head in the period 1932–41. The value of mules per head increased in 1942 to $127.46 compared with $107.51 a year earlier. Most of the mules are raised in the south central states with Texas producing more than twice as many as any other state. Next in importance as mule raising states are Mississippi, Georgia, Alabama, North Carolina, Tennessee, Arkansas and Kentucky. The army demand for mules dropped off as the needs for foreign campaigns were supplied by purchases in the localities abroad. The increase in prices of mules was attributed more to expansion of the cotton acreage than to the demand for animals for the army or other war activities. (*See* also SHOWS.) (J. C. Ms.)

Horse Shows: *see* SHOWS.

Horticulture. Horticulture throughout the world in 1943 saw greatly restricted flower production and greatly expanded production of food. In the United States the restrictions caused florists to devote some of their greenhouse area to vegetables instead of ornamental plants. Shorter hours went into force and there was doubling up in deliveries. At the same time, prices were increased to a degree not known for many years. On the whole, therefore, florists had an unusual measure of prosperity. However, leading florists made efforts to see that prices did not reach excessively high points.

The growing of ornamentals in the British Isles was permitted to continue at about the same rate as in 1942 and shipments of tulip bulbs to the United States were made. Large vegetable and flower shows were held by the Royal Horticultural society in London, and attended by throngs. Canada bought a reasonable number of bulbs from England and the United States. The European bulb industry shrank to very small proportions, although the Netherlands sold some bulbs to Germany. The Netherlands growers were reported to have given up much of their bulb acreage to the growing of vegetables, but to have preserved strains of their best tulips and narcissi, hoping to resume business on a large scale at the end of the war.

The seed business continued to reverse former conditions. Such seeds as were, at one time, purchased in great quantities abroad were being shipped from the United States to the very lands from which they were once brought. Well over 100,000,000 lb. of vegetable and field seeds were sent by ship and plane to the Allied forces overseas. Shipments made to the U.S.S.R. were particularly heavy and victory gardens were planted in Stalingrad and Leningrad. Late in the year, however, large consignments of field seeds to Russia were held up by lack of shipping accommodations. Many seeds were sent to North Africa, where efforts were made to induce food production by refugees from Europe and Italian prisoners. Large shipments of vegetable seeds were made to the British Isles, where 8,000,000 ac. of new land were being cultivated. Both vegetable seeds and canning equipment were sent to Australia.

In the United States great stress was placed on home gardens and community gardens under the general name of victory gardens, of which some 20,000,000 were listed. Late in the year the department of agriculture in Washington expressed the wish that this number be increased to 22,000,000 in 1944, and that larger gardens be made where possible. A Victory Garden institute, supported by industrial corporations, was organized in New York city. The 1943 victory gardens produced 8,000,000 tons of food, with an estimated value of $1,000,000,000.

The use of fertilizers and insecticides was restricted and a shortage of tools began to develop. Pyrethrum flowers used for an insecticide grow in territory controlled by the Japanese. They also grow to some extent in North Africa, but the natives lagged in the work of harvesting the flowers.

The cultivation of rotenone, which is even more important as an insecticide, gained ground in Brazil and Peru. Planting stocks of derris, from which it comes, were distributed to growers in Central America, Colombia and Ecuador. Plantings in Ecuador increased so fast in 1943 that more than 2,000 ac. were promised by 1945. The government completed arrangements for planting 100,000 cuttings in Haiti.

Efforts were being made to increase the production in South America of other economic plants, formerly imported from the far east. Among them was the cinchona tree, from the bark of which quinine is made. Before the war 95% of the world's supply was produced in the Netherlands Indies. In 1943, agreements were made to provide thousands of acres for growing cinchona trees in Guatemala, Colombia, Brazil and other Latin American countries. Large plantings were also made of abacá a banana-like tropical plant from which comes hemp for making rope. Progress was made in establishing various food materials like vanilla, ginger, black pepper and nutmeg in the Latin Americas on a commercial basis.

Lack of manpower was keenly felt by fruit growers and market gardeners as well as general farmers throughout the United States. Thousands of Mexicans and natives from islands off the Atlantic coast were imported to help in this work. Labourers were sent from the southern states to Maine in the autumn to help harvest a record-breaking potato crop. In some sections soldiers were used to pick apples, but the apple crop was considerably smaller than in 1942. The peach crop was greatly reduced by late frosts in the spring.

Buying of seeds for planting the crops of 1944 began early in the fall of 1943, but the indications were that there would be sufficient seeds to meet all demands, although some varieties might not be available. Production of 22 kinds of food crop seeds was estimated late in the year to total 214,651,000 lb., this being about 15% larger than the 1942 production. The largest increases were in lettuce, carrots, onions, winter squash, cucumbers, sweet corn and certain beets. There was a decline

in cabbage, turnips and romaine lettuce.

Greatly increased interest in soybeans as a food product was shown by amateurs and increased plantings seemed likely in the future. Certain varieties proved to be excellent for home use, although the pods were small and difficulty in shelling was encountered.

Late in the year the George Robert White medal of honour, the outstanding horticultural award of the United States was given to Richardson Wright, editor of House and Garden, New York. (*See* also BOTANY.) (E. I. F.)

Hospitalization Insurance: *see* INSURANCE.

Hospitals. Many factors contributed to increase the number of people seeking hospital care in 1943. Even in established communities there was a "doubling up" of families which left less opportunity for the sick to be cared for at home. Many new industrial communities mushroomed far beyond the ability of available hospital beds to meet their needs. Improved economic conditions enabled more persons to pay for hospital care. Births increased as much as 30% in many large areas. The proportion of mothers seeking the hospital for maternity care continued its rapid increase. The movement of one-third of the most active physicians and nurses into the armed services threw such a load on the remainder that people simply could not get the home care they needed and could get in peacetime.

This movement of physicians and nurses into the armed services reduced the professional staffs of hospitals by as much as 40% in some instances. But the hospital is a self-contained unit and its lay force in dietary, mechanical, housekeeping and similar departments is quite as necessary as is its professional personnel. This group was even more seriously depleted both by entrance into the armed services and by the lure of high wages paid in the defense industries.

The problem was met by stripping every procedure of as many of its niceties as possible without detriment to the patient, by calling personnel from retirement back into service, by the wide use of volunteer and other part-time workers, by limiting admission of patients to those in most acute need, and by discharging them at the earliest possible moment to spend their convalescence at home.

FLIGHT NURSES at Bowman Field, Kentucky, learning how to set up a "flying hospital" in eight minutes. Many such U.S. air ambulances were in operation on all fronts in 1943

A more permanent problem for hospitals was the threat of new social security legislation which proposed to make some form of insurance for the payment of hospital bills compulsory and under governmental auspices. The 15,000,000 people enjoying the protection of the existing voluntary hospital insurance plans fostered by the voluntary hospitals of the United States proved that the unpredictable cost of hospitalization could be carried by the wage earner at moderate cost. The extension of protection by compulsion and to those who do not need protection was being combated by hospitals in the fear that such governmental control would rob the hospital of its initiative, the individual of his independence, and both the hospital and the medical profession of the incentives which gave them the medical leadership of the world and the American people the best medical care of any people in the world.

Housing. Manpower and metals were needed for war purposes in 1943 as in 1942. Therefore, new housing construction was limited to the 820 localities in which there was a shortage of homes for in-migrating war workers and families of military personnel. It was estimated by the National Housing agency that 3,533,721 living units were provided from the inception of the war housing program on July 1, 1940, to July 31, 1943. These were made available in the following manner:

One million eight hundred thousand rooms, apartments or individual homes were found in existing buildings that required no structural change. Private industry built 764,402 new units and converted 204,300 units in existing structures. Most of the financing was guaranteed by the government through NHA's Federal Housing administration. NHA's Federal Public Housing authority financed, with public funds, 700,426 new units (mostly temporary construction to be removed when the war is over) and 64,593 conversions. These units were built by private construction firms, but turned over to the government for management when completed.

In the first eight months of 1943, despite the labour shortage, housing production nearly doubled that completed in the same period of 1942. The 370,837 units built exceeded 1942 production by 197,749. This resulted from the co-ordinated team work of the housing agencies united under NHA in Feb. 1942. Besides uniting many of the operations of its 16 entities, NHA had effected cordial working relationships with the War Manpower commission, the War Production board, the army and navy, and the congress. Therefore, it was possible to turn out in 1943's first eight months, 99,640 privately financed units, 267,107 publicly financed new units, and 4,090 publicly financed conversions of existing structures. At the end of September, 84,291 new privately financed family dwellings were under construction, 13,479 publicly financed conversions, 115,341 publicly financed family units, 30,387 dormitory units, and 8,901 trailers.

On May 13, 1943, the president sent a message to the congress calling attention to an estimated in-migration of 1,100,000 to war production centres during the fiscal year 1944. This estimate was

revised to 1,200,000 in Sept. 1943, requiring 925,295 added housing accommodations, 560,000 to be provided in existing structures. Congress, which had appropriated $915,000,000 in 1942 for the construction of war housing, and another $100,000,000 in July 1943, was asked in September to appropriate for the use of FPHA, an additional $200,000,000 to provide 164,095 more units of temporary construction. On March 23, 1943, it increased the authority of FHA to issue mortgages on privately financed war housing from $800,000,000 to $1,200,000,000, and from $1,200,000,000 to $1,600,000,000 on Oct. 15, 1943.

Every effort was made to have private enterprise finance and build wherever it was economically feasible. Publicly financed housing was programmed wherever there was uncertainty concerning the future need of the structures in the community at the close of the war.

Construction agencies started in 1941 to battle with the problems of cutting down the amount of critical material contained in each house, and with methods of housing workers so that a minimum of houses might be built. Temporary family dwellings were built with less than 2,000 lb. of critical metals per unit, as compared with the prewar permanent units which contained about 9,000 lb. To save materials, much emphasis was placed upon dormitories. But in many localities they proved unacceptable to workers. Consequently, relatively more family units were programmed in the latter part of 1943 and fewer dormitories. In Sept. 1943, the estimate of family units required was raised from 260,000 to 340,000 and the dormitory program cut from 70,000 to 25,000.

Since war housing was constructed to shelter war workers, the size and cost was restricted to meet the income of the war worker, and to use a minimum of critical materials. Private construction was topped at $6,000 per unit, public, consisting mainly of temporary dwellings, averaged $3,000 per family unit.

The Negro war worker, as the Negro in prewar days, was found to be living in intolerable conditions. It was difficult to find accommodations in areas not already established for Negroes. Consequently, they were forced into already overcrowded, insanitary quarters. In Detroit, Baltimore, Washington, Los Angeles and other cities, grave situations arose. Special emphasis was placed upon finding accommodations for Negroes. Many builders realized for the first time that there was a large ready market for Negro purchasers or renters. Many sought to supply the market, but it was difficult to interest mortgage money, and there was also great community resistance. Some progress, however, was made.

Great popular interest was aroused in the question of construction of homes for the postwar period. Several cities—Buffalo, Syracuse, Boston, Chicago—began to measure the future housing needs of their population. The national market was estimated to be from 620,000 to 2,000,000 a year for ten years following the war. The greatest market was said to be in the house costing less than $4,000, but a sizable demand was predicted for the $6,000 to $10,000 home. To prepare for the postwar period, chambers of commerce, real estate and civic associations studied methods of rebuilding slum and blighted areas. (*See* also BUILDING AND CONSTRUCTION INDUSTRY; BUSINESS REVIEW; CENSUS, 1940; FEDERAL WORKS AGENCY; MUNICIPAL GOVERNMENT; NATIONAL HOUSING AGENCY; WASHINGTON, D.C.)

Great Britain.—The findings of the advisory committee set up by the ministry of health to recommend standards for postwar housing had not been published but it was anticipated that they would make some revolutionary recommendations as a result of the evidence which they received from all sorts of societies and organizations concerned. The only outstanding event in connection with housing generally in 1943 was the scheme of the ministry to produce 3,000 houses for rural workers; many regarded this number of houses to be built immediately as by no means large enough. It may be assumed that the scheme was in the nature of an experiment and a purely emergency measure. Costs had risen over 100% on prewar figures but it was expected that they would drop again considerably with the passing of wartime conditions. Nevertheless the costs of the postwar house were likely to be much higher than prewar although the higher costs should not prevent the introduction of a higher standard of housing.

A few houses experimenting with new methods of construction and use of materials were erected by various interests, although anything approaching the final and acceptable prefabricated house had not yet appeared. Much was being done by manufacturers of the components for houses, such as windows, doors, and so on, and more particularly in connection with standardization of equipment for cooking, heating, refrigeration, etc. It may be taken that even though the structure of the small house would probably be carried out largely on traditional lines, there would be available and generally used a standard of mass-produced equipment of every kind.

The work of the board of trade in producing utility furniture for those who had lost their homes through enemy action and for the newly married had undoubtedly set a standard in simplicity which would have its influence.

The services of the most eminent designers were secured for this furniture, resulting in the best possible use being made of such materials as were available. The furniture was well received and something like 140,000 people had been supplied. (F. R. Y.)

Howard, Leslie (1893–1943), British actor and director and producer of motion pictures, was born Leslie Stainer on April 3 in London. The son of a stockbroker, he worked as a bank clerk until the outbreak of World War I, when he joined the British army. Invalided out of the army in 1917, he became an actor, changed his last name to Howard and appeared in a number of plays in London and New York city. His first movie, *Outward Bound,* was an immediate success. Outstanding pictures in which he appeared included *The Cardboard Lover, Berkeley Square, The Animal Kingdom, Of Human Bondage, British Agent, The Scarlet Pimpernel, The Petrified Forest, Pygmalion, Gone with the Wind* and *The Invaders.* After the outbreak of World War II, he returned to England to make a series of war pictures for the British government. In April 1943, he undertook an extensive lecture tour of Spain and Portugal under the sponsorship of the British council. While flying en route to London, the British transport plane in which he was a passenger was shot down by an enemy plane on June 1 and all passengers aboard were presumed lost. Howard's last picture was *Spitfire* (1943), which portrayed the life of Reginald Joseph Mitchell, designer of the British Spitfire fighter plane.

Howland Island: *see* PACIFIC ISLANDS, U.S.

Hrdlicka, Ales (1869–1943), U.S. anthropologist, was born March 29 at Humpolec, Bohemia. Dr. Hrdlicka travelled the world over for 40 years in search of data

that would shed new light on the origin of the human race and explain the phenomenon of prehistoric migration. Although Dr. Hrdlicka calibrated many human and anthropoid skulls in his research, he was immune to the "missing link" theory. He contended that human life did not exist on the American continent in prehistoric times and that man migrated from Asia by way of Alaska at a comparatively late period. To prove his view, he presented his findings, accumulated after painstaking research in Siberia and the Aleutians, in scores of articles in scientific journals. He retired from the National Museum of the Smithsonian institution, Washington, in 1942, but was later restored to active service. His later works include *The Peoples of the Soviet Union* (1942) and *Alaska Diary, 1926–31* (1943). Dr. Hrdlicka died in Washington, D.C., Sept. 5. (See *Encyclopædia Britannica.*)

Hull, Cordell (1871–), U.S. statesman, was born Oct. 2 in Overton (now Pickett) county, Tenn. He was graduated from the Cumberland university law school in 1891 and served as a captain in the Spanish-American War. He served in congress from 1907 to 1933, except for one brief interval, 1921–23. He was elected to the senate in 1931 but resigned in 1933 to become President Roosevelt's secretary of state. Internationally, his name became closely associated with the "good neighbour" policy in South America and elsewhere; he was a consistent foe of aggression in settling disputes. He roundly denounced the Japanese attack on the Philippines and Pearl Harbor on Dec. 7, 1941, as a "treacherous and utterly unprovoked attack."

On April 8, 1943, Secretary Hull signed a reciprocal trade agreement with Iran, the 27th of a series of such pacts made by the United States and the 7th since the beginning of World War II. In a speech on foreign policy (Sept. 12), he stressed the necessity of postwar co-operation between nations. In August Hull accompanied President Roosevelt to Quebec, where he participated in the British-Canadian-American conferences. Two months later he travelled to Moscow to confer with Anthony Eden, British foreign secretary, and Vyacheslav Molotov, soviet foreign commissar. This, the first meeting between statesmen of the three countries, foreshadowed the later conference between the heads of the states themselves at Tehran.

SECRETARY HULL and Foreign Commissar Molotov at the Moscow airport shortly after Hull's arrival to take part in the Allied conference which resulted in the Pact of Moscow, announced Nov. 1, 1943

Hungary. A kingdom in central Europe. Area (1940) 61,728 sq.mi.; pop. (1940) 12,708,439. Capital: Budapest. Chief cities: Budapest (1,115,877); Szeged (131,893); Debreczen (122,517); Kolozsvár (100,844); Kecskemét (83,732). According to official figures published in 1942, the territory acquired by Hungary from Yugoslavia in 1941 and called officially "Southland," contained 339 towns with a population of 1,024,876. As a result of this expansion, the population of Hungary in 1942 was officially estimated at 14,733,000 in an area of 66,409 sq.mi. Religion: the majority are Roman Catholics, with strong Protestant and small Jewish and Greek minorities. King: throne vacant since 1918, royal functions exercised by regent Nicholas Horthy de Nagybánya. Premier (1943): Nicholas von Kallay.

History.—During 1943 Hungary continued as an ally of Germany in the axis war against Great Britain, the soviet union and the United States. As a result of its co-operation with Germany, Hungary had gained large territories from Czechoslovakia (Ruthenia and eastern Slovakia) and from Rumania (northern Transylvania). When Yugoslavia collapsed after German aggression in April 1941, Hungary occupied and formally annexed fertile Yugoslav provinces north of the Danube. In its desire to keep the territories acquired between 1938 and 1941, Hungary was determined to fight on the side of Germany. But the rapid advance of the Russian troops in 1943 toward the Carpathian mountains filled the strongly anti-communist and pro-fascist government of Hungary with deep apprehensions. On the whole the Hungarian government continued to follow the nazi line in its foreign and domestic policies in 1943, yet of all the satellites of Germany it retained the greatest independence and even kept the traditionally parliamentary forms of the Hungarian constitution.

The anti-Semitic legislation, though theoretically as thorough as in Germany, was not applied with the same ferocious ruthlessness as in other German satellite states.

Admiral Nicholas Horthy, the regent of Hungary, visited Chancellor Adolf Hitler in April 1943. Their conversations may have dealt with the questions of Hungary's active participation in the war against the soviet union where Hungarian troops had suffered heavy losses. The troops in Russia had been under the command of Col. Gen. Vitez Gusztav Jany, who was wounded and succeeded by Col. Gen. Ludwig von Csata, commander of the 5th Hungarian army corps in Russia. When Col. Gen. William Nagy resigned as Hungarian war minister in June 1943, Col. Gen. Ludwig von Csata was appointed to succeed him.

The Hungarian government found itself in a difficult situation. There was a rising demand for a *rapprochement* with the Allies if that could be done without incurring German measures of retaliation, and at the same time with Hungary keeping as much as possible of its territorial gains of the previous five or six years. On the other hand there was a strong pro-nazi minority represented by the party led by the former prime minister, Bela Imrédy, and the numerous German minority in Hungary. This opposition demanded an even closer association with Germany and the complete nazification of the country. Fortunately for the government the Hungarian nazis were torn by internal strife and rival leadership. Thus while German-Hungarian relations were more strained than those between Germany and any other of the satellites, Hungary sought some backing in its close friendship with Italy. In June 1943 the Italian minister of national education visited Budapest for the opening of new offices of the Italian Institute of Culture. This effort at a backing by Italy received

a rude shock in July 1943 with the collapse of the Italian fascist regime.

Some of the opposition to the pro-nazi legislation of the government in 1943 came from the Catholic primate of the country, Justinian Cardinal Serédi, who declared that "Christ's teachings do not acknowledge difference between men and men and do not know prerogatives which would entitle a man or a nation to oppress another man or nation on racial or national grounds. Human freedom is the greatest among human rights and for it humanity has fought out innumerable battles; such a battle is going on also today and it will continue until freedom will have become such a natural need for people as air." Nothing definite was known about the strength of the underground movement in Hungary in 1943. The social democratic party still was allowed to function but remained strictly within legal bounds. In the United States a Committee for a New Democratic Hungary was formed under the chairmanship of Professor Rustem Vambery.

Education.—Education is compulsory for children between 6 and 12, while for three more years they have to visit continuation schools or courses, many of them specialized agricultural schools. Besides these continuation schools and a relatively large number of special schools, Hungary had, in 1939, 8,103 elementary schools with 23,215 teachers and 1,104,916 pupils. In the cities there existed 418 primary schools with 4,619 teachers and 105,466 pupils. High schools of different kinds numbered 263, with 4,709 teachers and 79,435 students. There were four universities, Budapest, Pécs (Fünfkirchen), Debreczen and in the newly acquired Transylvanian territory Kolozsvár (Cluj or Klausenburg). These universities had a total of 7,032 students, including 1,011 women.

Finance.—The monetary unit is the pengö, containing 0.263158 grams of fine gold, equal to 19.77 cents U.S. in March 1941. The revenue for 1943 was estimated at 4,047,000,000, the expenditure at 4,247,000,000 pengös. The public debt amounted on Sept. 30, 1942 to 4,869,000,000 pengös, bank notes in circulation on Sept. 30, 1942 to 2,470,000,000 pengös. As against this circulation, the national bank of Hungary had a metal reserve, including foreign exchange, of 166,000,000 pengös.

Trade and Communication.—Hungary imported, in 1941, goods valued at 730,000,000 pengös and exported to a value of 791,000,000 pengös. Of the imports in 1939 almost half of the value came from Germany and half the exports went there. Italy held the second, Great Britain the third place.

In 1939 Hungary had 6,307 mi. of railroad, 2,898 post offices, 6,902 mi. of telegraph lines and 20,976 mi. of telephone lines.

Agriculture, Manufacturing, Mineral Production.—Hungary's main production is agriculture. In the fertile plains of the Danubian basin potatoes, maize, wheat, sugar beets, rye, barley and grapes are grown. Hungary is rich in forests, pigs and cattle. It has a wealth of good coal and important bauxite deposits. Most of the industry is connected with agriculture. Hungary produced in 1939, 10,625,452 tons of coal, 500,193 tons of bauxite, 409,292 tons of pig iron and 732,615 tons of steel.

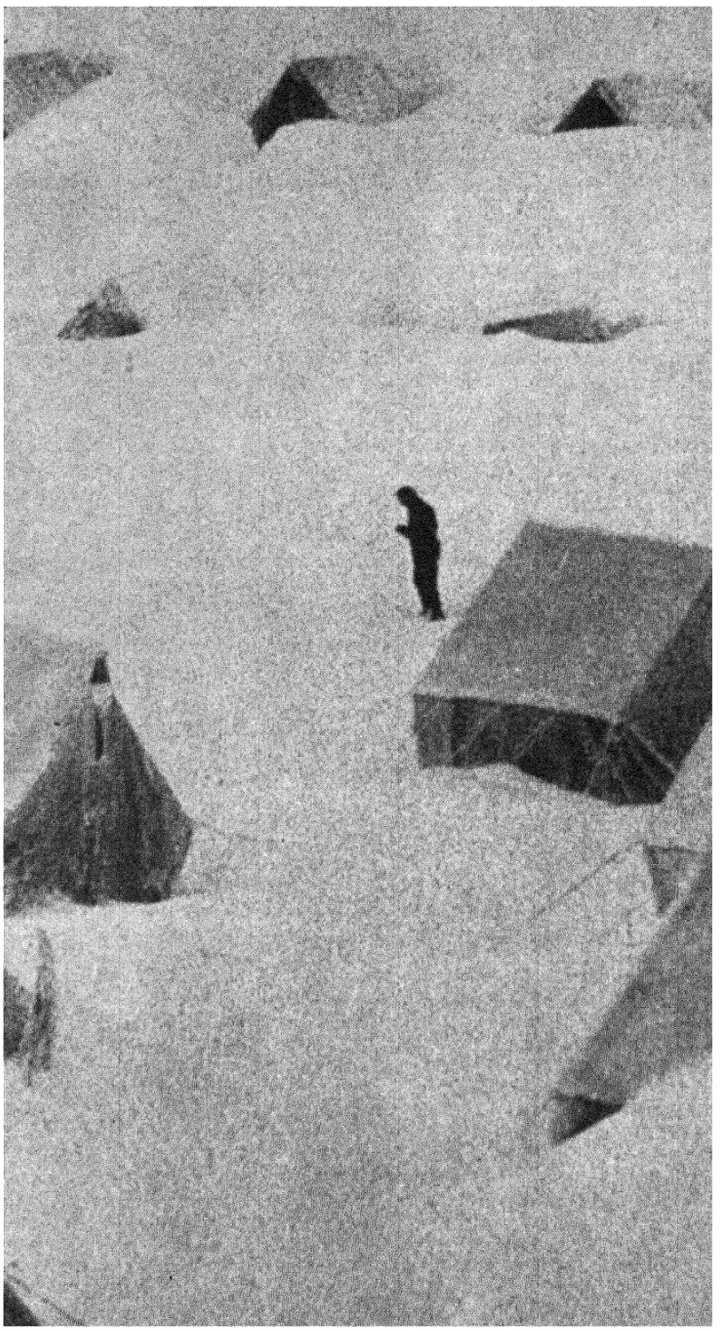
Ice Hockey. The Detroit Red Wings were dominant in professional hockey during the 1942–43 season, first winning the National Hockey league championship and then taking the Stanley cup playoff. Detroit finished four points ahead of the Boston Bruins in league play and swamped the same Bruins, four straight, in the cup final. Goalie John Mowers keynoted the Red Wings' triumph in the Stanley cup series by blanking Boston in two of the cup matches.

Although many outstanding players from Canada and the United States were taken into the armed forces, hockey enjoyed another successful season. The N.H.L. operated with only six teams instead of the usual seven, but nevertheless drew 1,446,747 fans. It marked an increase of 17,544 spectators per team over the 1941–42 season.

Minor league hockey was hard hit during 1942–43. The American Hockey association, a midwestern league, disbanded and the American league in the east was cut from ten to eight teams. The American association also failed to open at the start of the 1943–44 season, while the American league dropped further to six teams and split into two divisions—Providence, R.I., Hershey, Pa., and Buffalo, N.Y., in the east; Indianapolis, Ind., Cleveland, O., and Pittsburgh, Pa., in the west.

Buffalo won the American league hockey championship, while the Eastern league amateur crown went to the Curtis Bay Coast Guard Cutters. The Ottawa Commandos captured the Allen cup, emblematic of Canadian Amateur Hockey supremacy. Dartmouth was unbeaten in U.S. college competition to retain the Pentagonal championship.



Centre Bill Cowley of Boston was awarded the Hart trophy as the most valuable player in the National Hockey league. The George Vizina cup for the outstanding goal-guarding job went to Detroit's Mowers. Gay Stewart of Toronto was judged the outstanding rookie, while Max Bentley of Chicago won the Lady Byng trophy as the player with the best conduct on the ice. Doug Bentley, also of Chicago, led the league scoring with 73 points to tie Cooney Weiland's record, made during the 1929–30 season while with Boston. Doug Bentley and Cowley were placed on the league's all-star team, along with Frank Brimsek, Boston goalie; Earl Seibert of Chicago and Jack Stewart of Detroit, defensemen, and Joe Benoit, Canadiens, right wing. Jack Adams, who during 1942–43 piloted Detroit to its fourth league title and third Stanley cup, was named manager. (M. P. W.)

Iceland. An island state of the North Atlantic. Area, 39,709 sq.mi.; pop. (est. 1939) 120,264. Capital, Reykjavik, the only large town (pop. in 1939, 38,219). Religion, Lutheran Christian. Hereditarily united with Denmark, Iceland became an independent state Dec. 1, 1918, legally united with Denmark only by recognition of a common king. After April 9, 1940, the executive power was wielded by the Icelandic ministry, with a regent, Sweinn Björnsson. The chief minister in 1943 was Dr. Björn Thordarson, who formed a nonpartisan government on Dec. 16, 1942.

History.—Through 1943 the United States military occupation of Iceland continued, and the island continued to be an important Atlantic mid-station in the world-wide war. Major General William S. Key took command of the U.S. garrison in June.

Independence was the most important political question of 1943, but it was hardly a "question." By the agreement with Denmark of Dec. 1, 1918, Iceland might sever all ties with Denmark after Jan. 1, 1944. On May 17, 1942 the Althing resolved that Iceland did not intend to continue the union after the date set, and on Dec. 1, 1943 the three major parties in the Althing (Progressive, Independence and Socialist Labour [Communist], with 45 of the 52 total seats) issued a statement announcing their agreement that an Icelandic republic should be established not later than June 17, 1944.

The cost of living index, based on 100 for 1939, soared to 272 in Dec. 1942, but by Aug. 1943 had dropped to 247. The feared runaway inflation was averted, at least for a time, through strong governmental action including price fixing and subsidies.

THE WINTER OF 1942-43 was a bleak one for U.S. soldiers stationed in Iceland, but winterized tents and large stoves kept them warm

Commercially the most notable thing was the shift of trade from Britain to the U.S. (See *Trade*, below.)

The Roman Catholic Church appointed Jóhannes Gunnarsson Bishop of Iceland—the second Catholic bishop since Lutheranism became the state religion in 1550.

A dream of years approached realization despite wartime obstacles and delays: the hot springs were being connected by pipe lines with the homes of Reykjavik to supply steady heat for houses, heat and water for private greenhouse vegetable gardens, and water for health baths.

Finance.—Monetary unit: krón = 18 U.S. cents (1939), about 15.5 U.S. cents in 1942; in 1939 government revenues were 19,930,879 krónur (and estimated for 1943 at 33,736,100 kr.); expenditures, 19,378,318 kr. (and estimated for 1943 at 28,333,238 kr.); national debt (1939), 56,648,000 kr.; notes in circulation, 14,000,000 kr.; gold reserve, 5,762,000 kr.; bank capital and reserves, 17,577,000 kr.; bank deposits, 76,720,000 kr.; total bank funds, 48,997,000 kr. Bank deposits were 452,421,000 in July 1943. Note circulation jumped from 24,580,000 kr. in Jan. 1941 to 123,810,000 kr. in Aug. 1943; loans in the same period, from 92,137,000 kr. to 170,594,000 kr. Gold reserves and bank capital remained practically at the 1939 figures.

Trade.—Exports in 1939 totalled 69,654,000 kr.; chief articles of export were fish and fish products. Imports in 1939 totalled 61,639,000 kr. The chief imports were gasoline, textiles, metal wares, wood and machines. Great Britain took most of Iceland's exports in 1939 (11,794,000 kr.), followed by Sweden (8,517,000 kr.); Denmark (7,708,000 kr.); Germany (7,488,000 kr.) and the United States (7,378,000 kr.). Great Britain also was first in supplying Iceland's imports, with goods valued at 13,785,000 kr. Denmark was second (12,684,000 kr.) and Germany was third (10,125,000 kr.).

The years 1941 and 1942 show some significant contrasts with the peacetime balance depicted in the above paragraph. Exports rose steeply in value: 188,504,000 kr. in 1941, about two and one-half times the value of 1939; in 1942 the figure was 200,433,000 kr. In 1941 a large credit balance was allowed to accumulate, but in 1942 Iceland imported more than she exported, and continued to do so in 1943. Iceland sold her fish to Great Britain, amounting in the first seven months of 1943 to about the same as in 1942, and simultaneously she increased exports to the U.S. Her purchases, however, showed a startling reversal from a British trade double the American to an American more than double the British. Unemployment was nonexistent.

Communication.—Highways (1936) totalled 2,728 mi., of which 1,736 mi. were improved and 992 mi. were unimproved. Miles of telegraph lines (1939): 9,700. Military occupation led to unrevealed new construction.

Agriculture.—In 1938 the chief products with their yields in tons were as follows: hay (269,024), potatoes (13,160), turnips (2,856).

BIBLIOGRAPHY.—Austin H. Clark, *Iceland and Greenland*, Smithsonian Institution War Background Studies No. 15 (1943). (F. D. S.)

Ice Skating.

Of the two competitive phases of ice skating, only figure skating held a national championship during 1943. The war forced cancellation of the National speed championships, but minor tournaments were held both on the east coast and in the middle west.

Gretchen Merrill, a 17-year-old member of the Skating club of Boston, won the women's senior figure skating championship of the United States, having placed as runner-up the two previous years. The national men's senior title went to Arthur R. Vaughn, Jr., of Philadelphia. Vaughn, who placed third in the senior event in 1942, is a brother of Mrs. Jane Vaughn Sullivan, the 1942 senior women's champion who did not defend her title in 1943.

With Ken Bartholomew, the '42 national champion, in the armed services, Dick Werner of Patterson, N.J., dominated men's speed skating. Werner won the Middle Atlantic, New York State and Eastern championships. Carmelita Landry of Fitchburg, Mass., continued her rule of women's speed skating by winning the Middle Atlantic and New York State titles. Miss Landry won both the National and North American crowns in 1942.

Musical ice shows continued their upward trend in popularity, with three major shows touring the country. Forty performances in New York's Madison Square Garden alone attracted 385,000 spectators. (M. P. W.)

Idaho.

One of the far northwestern states of the U.S. belonging to the group regionally designated as the Pacific northwest. Idaho was admitted to the union on July 3, 1890, and is popularly known as the "Gem state." Area, 83,888 sq.mi., pop. (1940) 524,873, of which 66.3% was rural, 33.7% urban. There were 3,638 Indians in the state. Principal cities are Boise, the

capital (26,130), Pocatello (18,133), Idaho Falls (15,024), Nampa, (12,149) and Twin Falls (11,851).

History.—There was no general election in 1943. State officers elected Nov. 3, 1942 were as follows: governor, C. A. Bottolfsen (Rep.); lieutenant governor, Edward Nelson (Rep.); secretary of state, George H. Curtis (Dem.); attorney general, Bert H. Miller (Dem.); auditor, Calvin E. Wright (Dem.); superintendent of public instruction, C. E. Roberts, (Dem.); mine inspector, Arthur Campbell, (Dem.); state treasurer, Mrs. Myrtle Enking Beatty (Dem.). The legislature elected in Nov. 1942, convened in Jan. 1943: both houses were Republican. The principal subject of controversy was the Old Age Pension act adopted by a safe majority in 1942 on an initiative vote. Within ten days after the election Chase A. Clark, then governor, declared the act a "law in full force and effect." The legislature "repealed" the act and Governor Bottolfsen signed the repeal. Pension advocates immediately started a movement for the recall of the governor and of all legislative members who had supported the repeal. Up to the close of 1943 a sufficient number of signers had not been secured.

Education.—The school population in 1942–43 was 118,000. There were 80,572 pupils and 3,802 teachers in 1,005 elementary schools. High school enrolment was 28,007 pupils with 1,326 teachers in 176 high schools. Enrolment in other educational institutions was as follows: state university (Moscow), 871; southern branch (Pocatello), 760; normal school (Lewiston), 241; normal school (Albion), 78; junior college (Boise), 496; junior college (Coeur d'Alene), 51.

Charities and Correction.—There were two institutions for the insane, one at Blackfoot and one at Orofino, as well as a home for the feeble-minded at Nampa. The penitentiary at Boise had 148 inmates at the close of 1943; it has a capacity of 400. The reform school, known as the "state industrial school," located at St. Anthony, has a fairly constant population of 250.

Communication.—There were 4,910 mi. of state highway and approximately 33,000 mi. of county and forest roads at the close of 1942, with very little construction of other than military roads in 1943. The state had 2,890 mi. of railroad in 1942. Eight major airports were under government control and there were, in addition, a large number of emergency and forest landing fields. There was a very large growth in telephone service during 1943, because of military requirements. The number of instruments in use was estimated at 90,000 with approximately 160,000 mi. of wire. Telegraph mileage was approximately 9,000 mi.

Banking and Finance.—On Dec. 31, 1943 there were 33 state banks with capital of $1,250,000 and surplus of $1,005,500. As of Oct. 18, 1943, there were 54 national banks with capital of $3,510,000 and surplus of $2,788,050. Assessed valuation of the state in 1943 was $408,549,711. State treasurer's receipts were $45,665,550; disbursements $41,352,960. Bonded debt of state government was $1,390,600 and will be cancelled by Dec. 31, 1944.

Agriculture.—Total value of all farm crops in 1943 was $185,271,000; in 1942, $134,660,000. Both figures exclude statistics for sugar beets.

Table I.—Principal Agricultural Products of Idaho, 1943 and 1942

Crop	1943	1942
Wheat, bu.	22,720,000	20,770,000
Corn, bu.	1,683,000	2,444,000
Oats, bu.	7,400,000	7,898,000
Barley, bu.	12,716,000	14,280,000
Sugar beets, short tons	608,000 (est.)	1,076,000
Dry beans, cwt.	2,479,000	2,234,000
Dry peas, bu.	3,326,000	1,775,000
Hay (tame), tons	2,189,000	2,141,000
Potatoes, bu.	43,470,000	30,590,000

Manufacturing.—Defense and war-material manufacturing took over the state's manufacturing activities to such an extent that no statistics were available for 1943. In 1940 there were 533 plants with 12,797 workers and payrolls aggregating $16,249,685.

Mineral Production.—Total value of mineral production in 1943 for the five leading metals was $43,910,180 as compared with $46,063,326 in 1942. The production of zinc in 1943 was the largest in the history of the state.

Table II.—Principal Mineral Products of Idaho, 1943 and 1942

Mineral	Value, 1943	Value, 1942
Gold	$ 1,120,000	$ 3,325,700
Silver	8,298,880	10,414,144
Copper	663,000	830,060
Lead	14,222,800	15,263,866
Zinc	19,605,500	16,229,616

(B. De.)

Illinois. A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," sometimes called the "Prairie state." Total area, 56,400 sq.mi. of which 55,947 sq.mi. are land. Pop. (1940) 7,897,241, including 3,967,481 males and 3,929,760 females; 7,503,987 white, 393,254 nonwhite. Population classed as urban was 5,809,650, rural not on farms 1,121,823, rural farm 965,768. The census bureau estimated the 1942 population at 8,008,067. Springfield, the state capital, with a population of 75,503, is the fifth Illinois city in size. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609).

History.—Intense effort in war industry and agriculture, despite the absence of 750,000 residents in the armed forces, featured Illinois life in 1943. The state stood sixth in the union in war expenditures. Up to Oct. 1, 1943, supply contracts and capital investments in plant and facilities totalled $9,015,490,000, excluding subcontracts and prime contracts of less than $50,000.

Of this amount $1,482,069,000 was for aircraft, $197,840,000 for ships and boats, $2,928,678,000 for ordnance and $3,140,589 for all other supply contracts. The total amount of facility contracts, principally industrial installations, was $1,266,314,000.

More than 800 Illinois plants were engaged in the manufacture of aircraft and parts. The four great ordnance plants erected in the state neared the saturation point of production, as was the case with tank and artillery plants. Production of landing barges and similar watercraft was stepped up throughout 1943.

Dwight H. Green was governor of Illinois in 1943; Hugh W. Cross, lieutenant governor; Edward J. Hughes, lone Democrat official, secretary of state; Arthur C. Lueder, state auditor; William G. Stratton, state treasurer; and George F. Barrett, attorney general.

Education.—Latest available statistics in 1943 placed enrolment in the approximately 12,000 school districts of Illinois at 1,281,854, with private and parochial school enrolment at 252,504. The state superintendent's estimate of total 1943 enrolment was 1,500,000. The decline of enrolment in 1943 was estimated at 7.5% for high schools and 6% for grade schools. Teachers in public schools numbered 45,438. Total expenditures by the state government for education in the fiscal year ended June 30, 1943, were $30,531,905.

Public Welfare, Charities, Correction.—Decline of the relief load in 1943 caused the return to the state treasury of $10,428,463 of unspent relief funds. Recipients of old-age assistance declined by 3,335. At midyear, the total receiving old-age assistance was 147,637, and dependent children receiving aid numbered 60,965. Payment of unemployment benefits decreased by 82% under the 1942 payments in the first half of the year. There were 30,899 in the state's nine hospitals for mental patients. The total population of welfare institutions was 42,778

on June 30, 1943. The population of Illinois's three main prisons and the state prison farm had declined by 880 by Aug. 10, the lowest figure in 13 years.

Communication.—The network of high-type highways in Illinois comprised 13,683 mi. in 1942, connected to about 56,000 mi. of lower-type road. State government expenditures on roads in the fiscal year ending June 30, 1943, were $50,798,801, both direct and in aid of localities. Illinois railroad mileage approximated 11,500.

Banking and Finance.—As of June 30, 1943, Illinois had 813 banks, of which 340 were national banks, 120 state institutions with memberships in the federal reserve system and 353 nonmembers. Total deposits were $7,826,735,000, total investments, $5,079,589,000.

Total appropriations by the state legislature for the biennial period July 1, 1943–June 30, 1945, were $503,847,000. Receipts for the fiscal year ending June 30, 1943, were $256,399,299. State trust funds and surplus included $98,000,000 invested in war bonds. The state had a bonded debt of $149,461,500.

Agriculture.—Major state crops harvested in 1943 had a value of $770,171,000, the highest since 1919, and $140,381,000 greater than in 1942. Hog production in 1943, 11,009,000 head, was the largest on record. Higher prices accounted for the gain in crop income, as the actual quantity of produce was a fraction of one per cent less than in 1942.

Table I.—*Leading Agricultural Products of Illinois, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	446,148,000	433,438,000
Soybeans, bu.	75,250,000	73,704,000
Oats, bu.	113,632,000	141,320,000
Wheat, bu.	17,330,000	12,818,000
Tame hay, tons	3,261,000	3,942,000

Manufacturing.—The value of products manufactured in Illinois in 1939, according to the U.S. biennial census (last before World War II), was $4,794,860,733; the number employed was 688,800; total wages and salaries were $988,453,881. The principal industries and the value of their products were as follows: meat packing, $479,501,224; steelworks and rolling mills, $207,301,815; petroleum refining $122,933,528; tractors, $121,550,621.

Mineral Production.—The total value of minerals produced in Illinois in 1939 was $210,295,738. (L. H. L.)

Table II.—*Production of Coal and Petroleum in Illinois, 1940 and 1939*

	1940	1939
Bituminous coal, tons	45,977,479	47,627,451
Petroleum, bbl.	146,788,000	94,912,000

Illinois, University of.

On March 2, 1943, the University of Illinois observed the 75th anniversary of its opening. More than 600 faculty and staff members were on leave in 1943 for war service. Teaching was on a year-around schedule, eliminating the usual summer let-up. Teaching of civilian students continued without curtailment and with 32 special courses added and the wartime and postwar values of all courses emphasized.

In May 1942, a Naval Training station was located on the campus, training signalmen and diesel-enginemen. Nearly 2,000 men were assigned to the station, with the personnel changing periodically as courses were completed. Under the army specialized training program and the navy V-12 program, an initial quota of 2,800 soldiers and sailors was assigned to the university for college training both in basic subjects and in various specialized fields including medicine and dentistry. Hundreds of others were examined at the university as an army specialized training and reclassification centre.

Under the engineering, science and management war training program 23,000 persons in 55 war-factory centres of Illinois were instructed through the division of university extension. Agricultural extension activities turned to intensive drives to increase farm production, to educate consumers in the conservation of foods and materials, and to promote victory gardens.

In the university's laboratories, the "down-draft coking principle" was built into a "furnace of the future," and a conversion burner for existing home furnaces was tested and made ready for postwar production, both promising a 25% fuel saving and smokeless burning of soft coal—goals long sought to benefit health and cleanliness in U.S. cities.

The operating budget for 1943–44 was $13,114,348, of which $7,304,962 was from state tax revenues. For statistics of enrolment, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

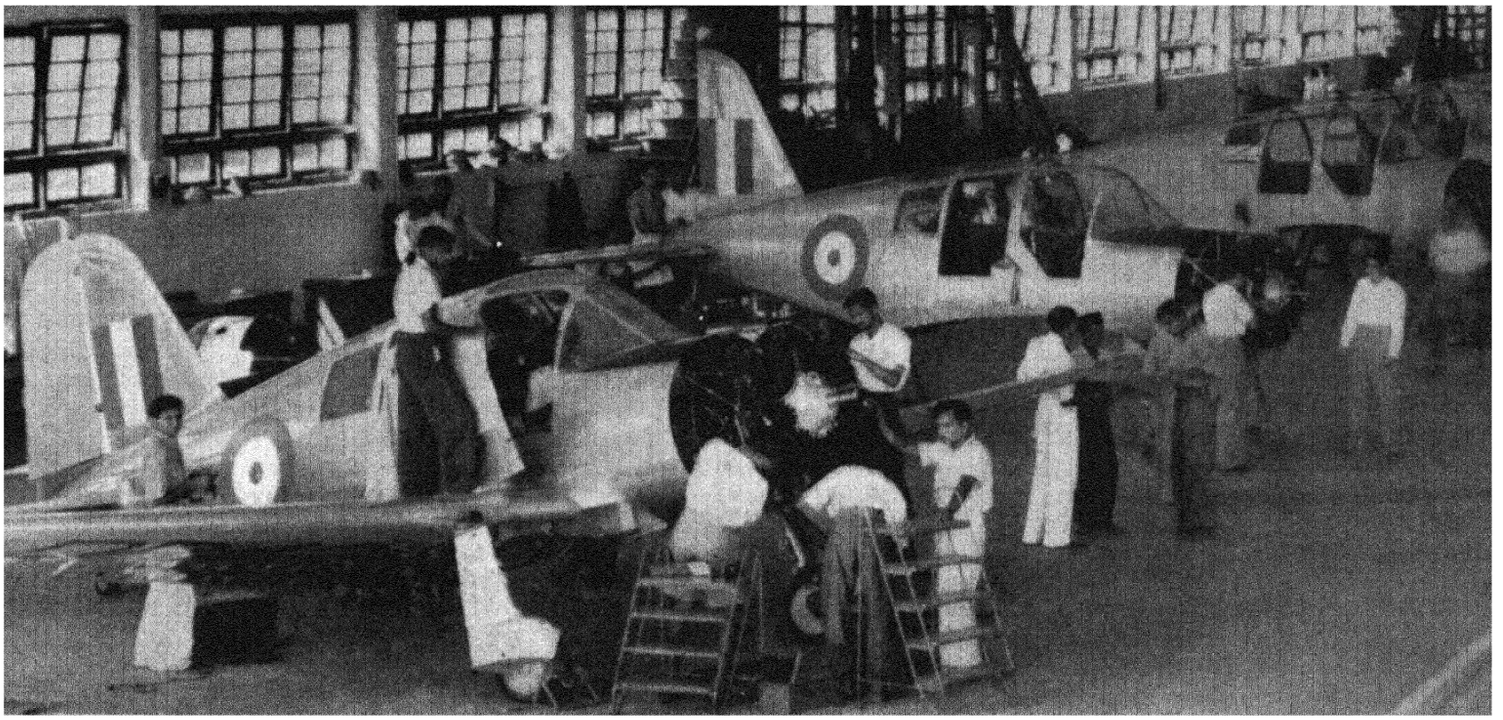
Immigration and Emigration, U.S.

The immigration and emigration of aliens are controlled in the United States by laws and treaties and by regulations based thereon, and are under the direction of the commissioner of immigration and naturalization in the department of justice. Aliens seeking to enter the United States for permanent residence are limited as to quality by the act of Feb. 5, 1917, which requires that they meet certain standards, mentally, physically, morally and economically. The Quota act passed on May 26, 1924, limits the number that may enter for permanent residence from certain countries.

During the fiscal year ended June 30, 1943, officers of the immigration and naturalization service passed upon 41,848,384 persons' entries into the United States. Of these 40,717,372 were across land borders, including 5,623,592 alien entries and 9,182,720 citizen entries from Canada, and 14,754,846 alien entries and 11,156,214 citizen entries from Mexico (making a total of 20,378,438 aliens and 20,338,934 citizen entries across both land borders). Alien entries for permanent residence numbered only 23,725 for the fiscal year ended June 30, 1943, a decrease of 5,056 from the fiscal year 1942 and the second lowest number to take up permanent residence in the United States for any fiscal year since 1831.

Quota immigrants numbered only 9,045, although under the law, 153,774 quota immigrants could have been admitted. Only 5,107 emigrant departures occurred during the fiscal year of 1943, the lowest number since 1908 when records of departure were first made. Immigration of permanent residents exceeded emigration by only 18,618.



During the period 1,495 aliens were excluded. There were 35,738 vessels boarded and 961,142 alien and citizen seamen inspected. The immigration border patrol officers patrolled 10,276,454 mi., examined 8,874,998 conveyances and questioned 24,598,186 persons, which resulted in the apprehension of 16,330 persons and the seizure of 147 conveyances. During this period 4,207 aliens were deported from the United States and 11,947 who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation. R.A.F. TRAINERS on an assembly line near Bangalore, India. This aircraft factory was established by an American, William D. Pawley

India. A sub-continent projecting from the mainland of Asia, India lies between the 8th and the 37th degrees of north latitude. It comprises 11 major or "autonomous" provinces, five minor areas directly administered by the central British government and a large number (between 500 and 600) of states under Indian rulers. The latter are scattered about the sub-continent and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at New Delhi and is under a viceroy and governor-general (Field Marshal Viscount Wavell, appointed in June 1943), who is also the representative of the crown in its relations with the native states. The total area is 1,575,187 sq.mi., of which the native states and agencies total 712,508 sq.mi.; pop. (est. 1941 census) 388,800,000. Chief cities (pop. census 1931): Calcutta (1,485,582); Bombay (1,161,383); Madras (647,230); Hyderabad (466,894); Delhi (447,442); Lahore (429,747). Languages: Hindi, Tamil and Urdu the most important; religions: Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth). Ruler, George VI, emperor.

History.—The year 1943 appeared to dawn more prosperously after the troubles and anxieties of 1942. The campaign of violence inaugurated by the Indian National congress had collapsed, and its leaders were under arrest. The Japanese invasion had been halted on the frontier, and air attack on Indian towns had proved less formidable than had been feared. In three raids on Calcutta at the end of 1942, only 23 were killed and 100 wounded. There was no panic and the A.R.P. services acquitted themselves well.

Financially, India was prospering as a result of the war. The great "steel cities" at Jamshedpur and Khumbarbhudi and the government ordnance factories were working at top speed. India was the centre of the South Eastern Supply Group, and the mills at Cawnpore and other places turned out vast quantities of khaki cloth, boots, equipment and tents. War orders were placed at the rate of over £15,000,000 per month. Under the Bevin scheme, skilled Indian workmen were sent in batches to England for training, and it was found possible to spare considerable supplies for the U.S.S.R. and China. The Bombay dockyards were busy night and day.

Still more significant was the effect of the war on India's external position. Before the war, the sterling debt of the government of India was roughly £360,000,000; in 1943 it was down to £12,500,000.

Ever since his internment in the Aga Khan's palace at Poona, Mohandas Gandhi had maintained a personal correspondence with the viceroy on the subject. When it was pointed out that his conduct had resulted in serious outbreaks, involving great destruction of property and loss of life, he replied that these were not the work of congressmen, or alternatively, that they had been provoked by the "leonine violence" of the British government. Finally he declared his intention, unless he and his colleagues were unconditionally released, of starting on Feb. 9 a three-weeks' fast on lime juice and water. This was the ninth occasion upon which Gandhi had resorted to this time-honoured Indian method of coercing a recalcitrant opponent. His most successful one was in Sept. 1932, when by a threat of "a fast unto death," he had in seven days induced Ramsay MacDonald to abandon the "communal award," which gave separate electorates to the untouchable Hindu castes under the new constitution.

Lord Linlithgow, however, stigmatized the 1943 fast as "political blackmail," and warned Gandhi that he alone was responsible for the result. He was willing to release Gandhi if he repudiated or dissociated himself from the resolution of Aug. 8, and the policy which that resolution represented, but neither Gandhi nor the congress was prepared for this repudiation. The viceroy offered, moreover, to allow him to perform his feat in a friend's house, and relaxed to a limited extent the embargo on receiving visitors. Gandhi refused the offer of release unless it was unconditional, and the fast duly began. He was 73 and there was considerable anxiety when it was announced that he was seriously ill. Madhao S. Aney and C. R. Rajagopalachari visited him and tried to induce him to abandon his intention, and appeals were addressed to the viceroy and Winston Churchill. Gandhi later rallied and emerged from his fast on March 3, apparently little the worse for his ordeal.

One of the results of the fast was a distinct exacerbation of communal tension. Mohammed Ali Jinnah and members of the Muslim league watched closely for any signs of yielding to congress demands on the part of the government of India. About 1922, in the days of the Khilafat movement, there had seemed to be strong hopes of a Hindu-Muslim *rapprochement*. Under the leadership of Abdul Ghaffar Khan, the Red Shirt leader, the Pathans of the North West Frontier province had gone over al-

most en masse, and, as a result of the elections of 1935, they had returned a congress government to office. But experience of the treatment they received from Hindu congress ministries between 1937 and 1939, especially in the United provinces, brought a sad disillusionment. None of the congress prime ministers formed coalition cabinets; government posts went to Hindus, and children attending government schools were reported to have been compelled to sing the Hindu national anthem, *Bande Mataram*, bow to Gandhi's portrait, and submit to other observances deeply repugnant to the Muslim conscience.

Although the president of the Indian National congress was Moulana A. K. Azad, a distinguished Mohammedan theologian, it was felt that this really counted for little; congress rule meant the restoration of the Hindu raj. The proposal put forward by Sir Stafford Cripps in 1942, that after the war the new constitution would be drawn up by a constituent assembly, caused deep disquiet, for such a body would naturally be preponderantly Hindu in its composition. By 1943 there were Muslim ministries in all the provinces excluding those taken over by the governors when the congress ministries were withdrawn at the outbreak of war. Efforts to bring about an understanding between the Hindus and the Muslim league on the part of Sir Tej Bahadur Sapru, the Liberal leader, and Rajagopalachari, the ex-premier of Madras, proved abortive. Jinnah had declared that India is "two nations": there had to be two Mohammedan national states, Pakistan and North Eastern India. Muslims would never collaborate in a federation in which they were placed in a permanent minority. Meanwhile matters remained at a deadlock, and Rajagopalachari was not the only politician who now regretted that the Cripps proposals were so summarily rejected.

Lord Linlithgow was due to retire in the autumn, and speculation was rife about the new viceroy when on June 19 it was announced that the commander in chief, Sir Archibald Wavell, had been appointed, with the title of viscount. He was to be succeeded by Sir Claude Auchinleck. At the same time, in order to relieve the commander in chief of the responsibility for the conduct of operations against Japan, a separate East India command was set up, and subsequently Lord Louis Mountbatten, famous as organizer of commando raids, was given the post. Never before had the office of viceroy been held by a serving soldier. Lord Wavell had had the unique advantage of two years' previous experience in the government of India before assuming office, and he had won the enthusiastic admiration of the Indian troops by his conduct of the African campaign.

Lord Linlithgow retired on Oct. 18. He had been viceroy and governor-general for the unprecedented period of seven and a half years, and none of his predecessors since Lord Canning had been confronted with equally grave anxieties. It was especially disappointing for him that the Act of 1935, in the framing of which he had taken so prominent a part, had never been given a chance of working.

The closing months of Lord Linlithgow's Indian career were darkened by the outbreak of famine in Bengal; the first for over 40 years. Famines are really endemic in India, where the staple foods are rice, millet and wheat, and the crops depend on the monsoon. It had been hoped that the peril had been permanently averted by the erection of extensive irrigation works like the Sukkur Barrage on the Indus, but the large increase in the population, over 60,000,000 in the preceding decade, had more than counterbalanced any advantage derived from this.

Economically, the year 1942 had been disastrous for eastern India. About 650,000 tons of grain had gone abroad to feed the Indian troops, and in October a cyclone and tidal wave had swept over the normally surplus district of Midnapur. Eleven thousand people lost their lives, and 75% of the cattle were drowned. Not only were the crops and stores of grain totally destroyed, but the fertility of the soil was permanently affected. This was followed by a serious outbreak of rice disease in eastern Bengal. The supply of Burmese rice was entirely cut off, and fears of a Japanese invasion led to extensive hoarding. The cumulative effect can be imagined when we realize that in a country of the size of India an increase of an ounce of food a day *per capita* means an additional 4,000,000 tons per annum. The government of India was censured for not taking prompter and more resolute action; but the provinces with a surplus were naturally reluctant to part with it, and the Bengal ministry was confident that it could cope with the situation unassisted.

Matters assumed a serious aspect by August. Crowds of destitutes were invading Calcutta in search of food, and it became an everyday occurrence to find corpses lying in the streets. Between Aug. 15 and Oct. 15, the mortality in the capital alone rose to 8,000. Voluntary societies worked heroically, but were handicapped by a shortage of supplies, and an outbreak of cholera or smallpox was apprehended.

On assuming office, Lord Wavell at once visited the spot, and enlisted the co-operation of the military authorities. All the troops not required for operations against the Japanese were detailed for relief work. Rest camps and hospitals had been established outside the city, and the sick and starving were removed to them. Over 5,000 free kitchens were opened, and 2,000,000 people were fed daily. Considerable supplies of grain, milk products and drugs arrived by sea, and the peak of the danger was apparently past. But it would take months to restore normal conditions; one of the greatest difficulties was that of food distribution in rural areas away from the beaten track. (*See* also FAMINES.)

Lord Wavell was faced with a threefold task—the defeat of Japan, the economic rehabilitation of Bengal, and the political settlement. (*See* also BURMA; WORLD WAR II.) (H. G. RN.)

Education.—(1938–39): Number of recognized institutions in British India (excluding Burma) 211,192; scholars in recognized institutions: primary, males 9,407,782; females 1,462,263; middle, males 1,150,272; females 179,506; high, males 1,059,909; females 115,341. Unrecognized institutions, 19,354. Universities, British India 15, native states 3; total number of students, 140,461.

Finance.—Revenue, central government (est. 1942–43) rupees 191,48,07,000; expenditure, central government (est. 1942–43) Rs.226,54,91,000; public debt (March 31, 1940): in India Rs.450,23,00,000; in England £280,100,000; notes in circulation (April 30, 1943) Rs.669,40,00,000; reserve (April 16, 1943) gold Rs.44,40,00,000, silver rupee coins Rs.13,70,00,000, sterling securities Rs.568,10,00,000. Currency: 1 rupee (Rs.1); Rs.100,000 = 1 lakh, written Rs.1,00,000; Rs.10,000,000 = 1 crore = 100 lakhs, written Rs.1,00,00,000; one hundred crores is written Rs.100,00,00,000. Exchange rate (average 1941) Rs.1 = 1*s.* 6*d.* = 30.14 cents U.S.; (July 1943) Rs.1 = 30.12 cents.

Trade and Communication.—Overseas trade (1942–43): imports, merchandise Rs.110,44,82,618; exports, Indian merchandise Rs.187,60,10,948; re-exports, merchandise, Rs.6,95,22,253; gold coin and bullion (1939–40), imports Rs.1,32,72,707; exports, Rs.36,00,26,302; imports of Afghan merchandise (1939–40) Rs.3,97,06,671; exports of Indian produce to Afghanistan (1939–40) Rs.72,79,399.

Communication.—Roads (March 31, 1938) British India only, 83,612 mi. motorable roads, 201,701 unsurfaced. Railways

(March 31, 1940) route mileage: broad gauge 21,154 mi.; metre gauge 15,899 mi.; narrow gauge 4,103 mi. Shipping, tonnage entered (monthly average 1939) 924,200; tonnage cleared (monthly average 1939) 917,500. Motor vehicles licensed (March 31, 1940): British India 94,788 cars and taxis; 43,187 commercial vehicles; 8,602 motorcycles. Wireless receiving set licences, all India (Jan. 1941) 121,534. Telephones (March 31, 1940): 86,219 straight-line connections, 626 exchanges.

Agriculture, Manufacturing, Mineral Production.—Production (in metric tons): rice (1940–41) 33,332,800; wheat (1940–41) 10,957,100; cane sugar, raw (1939–40) 2,770,000; maize (1937–38) 2,080,800; barley (1938–39) 2,119,500; jute (1940) 2,280,000; coal (1940) (British India) 26,496,000; iron ore (metal content) (1939) 1,994,000; pig iron and ferro-alloys (1939) 1,785,000; steel (1939) 1,035,000; petroleum, crude (1940) 325,000; cotton, ginned (1940–41) 1,049,600; groundnuts (1940–41) 3,528,700; tobacco (1939–40) 495,800; tea (1940) 174,800; manganese ore (metal content) (1939) 430,000; linseed (1940–41) 473,500; gold (1940) 9,000 kg.; bauxite (1939) 9,100; chrome ore (chromic oxide content) (1939) 25,000; rape seed (1940–41) 1,135,900; sesamum (1940–41) 408,200. Industry (excluding Burma): cotton (1939–40) yarn spun 1,233,686,576 lb.; woven goods 4,012,529,025 yards; number of mills 388; average number employed 430,165. Jute (1937–38): mills 105; average number employed 309,000. Total number of factories (1939) 10,466; average daily number employed (1939) 1,751,137.

Indiana.

A north central state with the popular name "Hoosier," Indiana became the 19th state in the union Dec. 11, 1816. The total area of the state is 36,555 sq.mi., of which approximately 510 sq.mi. are water. The population, according to the census of 1940, was 3,427,796; 1,887,712, or 55.1%, were urban; 1,540,084, or 44.9%, rural. Of the total, 93.2% were native white, 3.2% foreign-born white, and 3.6% Negro. Capital, Indianapolis (pop. 1940, 386,972), the largest city. Other cities: Fort Wayne (118,410); Gary (111,719); South Bend (101,268); Evansville (97,062); Hammond (70,184); Terre Haute (62,693); East Chicago (54,637); Muncie (49,720); Anderson (41,572).

History.—The 83rd general assembly, in session Jan. 7–March 8, 1943, though strongly Republican, developed little friction with the governor, a Democrat. Notable was the number of interim commissions (12) created to investigate conditions, codify laws, and locate institutions, and to report to the next general assembly. An act identical with one passed by the Kentucky legislature and enacted later by congress defined the state boundary along the Ohio river southeast of Evansville so as to include in Indiana a strip of land containing the Evansville water works, which Kentucky had claimed and against which it had levied taxes.

Perhaps the most important act was that fixing financial responsibility for operators of motor vehicles.

Much needed regulation was instituted for nursing homes for the aged, many of which sprang up after the establishment of old age pensions; they were required to secure licences and to comply with reasonable specifications. Improvement was made in the investment of the common school fund, which was formerly handled by the counties and for the most part put into mortgage loans. The state personnel board, established in 1941 by an act which put a number of Indiana state departments and institutions upon the merit basis, was abolished and substantially the same act was re-enacted with the sole object of changing the membership of the board—the board had been at odds with various state officers and institutions in the two years of its existence.

A most unusual circumstance was the delay in the printing of the acts of the general assembly. In Indiana, acts without an emergency clause become effective only upon proclamation of the governor reciting the fact that printed copies of the acts have been received by all the county clerks of the state. This process has usually been completed in May or June, but in 1943 it was not completed until Nov. 3. The delay caused embarrassments; some of the most important laws required action on or before July 1.

Officers of the state in 1943 were: Henry F. Schricker, governor; Charles M. Dawson, lieutenant governor; Rue J. Alexander, secretary of state; James M. Givens, treasurer; Richard T. James, auditor; James A. Emmert, attorney general; Clement T. Malan, superintendent of public instruction.

Education.—The number of elementary or common schools in the state in 1942–43 was 2,793. Pupils enrolled in them numbered 464,190; there were 11,844 elementary teachers. There were 866 high schools, with 183,189 pupils and 7,843 teachers (these are teachers in senior high schools; there were 1,103 junior high school teachers, for the most part counted as teachers in elementary schools). There was a total of 25,871 teachers in the state.

Public Welfare, Charities, Correction.—The state expended no money on relief in 1943. The amount spent by the townships of the state was much less than in 1942 but the statistics were not available at the end of the year. Receipts of the state for unemployment insurance in the fiscal year 1942–43 were $33,032,123; benefit payments were $3,815,086; administrative expenses of the system were $1,078,098. The state in 1943 maintained eight institutions for mental cases, including epileptics, nine homes, hospitals, and schools, three university hospitals, a school for the blind, a school for the deaf, and six penal and correctional institutions.

Communication.—Railway mileage in 1941 was 6,928; this figure remained approximately the same in 1942 and 1943. In 1942 there were approximately 10,210 mi. of highways in the state highway system and 70,610 mi. of county roads. Telephones in use numbered 564,794 in 1942.

Banking and Finance.—The total revenue of the state to meet the 1942–43 budget (July 1–June 30) was $48,836,701. The estimate of state revenues for 1943–44 was $36,000,000. Appropriations for 1942–43 amounted to $41,298,161; disbursements for the year amounted to $39,766,619. Appropriations amounting to $46,758,342 were made for the year 1943–44. On June 30, 1943, there was no state indebtedness (there is a constitutional provision strictly limiting state borrowing).

There was a balance of unappropriated surplus in the treasury of $26,977,988.

Two new state banks were organized, the first in more than five years; on June 30, 1943, there were 376 banks, three less than the year before. The state banks had total loans and discounts of $161,195,000; deposits amounted to $802,710,000; total capital was $64,261,000; total surplus amounted to $19,533,000. State Building and Loan associations numbered 179, with assets of $96,632,000. Credit unions reported to the State Department of Financial Institutions, 135, with assets of $4,007,000. On Oct. 18, 1943, there were in Indiana 221 banks (state and national) members of the federal reserve system. They had total assets of $1,521,591,000, including $782,250,000 in United States government direct and guaranteed obligations, $202,853,000 in loans and $31,153,000 cash in vault. Excluding reciprocal bank balances, they had total deposits of $1,434,659,000 (total liabilities, $1,436,686,000).

Agriculture.—Conditions were not so favourable for agricultural production in 1943 as in 1942, and the (estimated) produc-

Leading Agricultural Products of Indiana, 1943 and 1942

Crop	1943 (est.)	1942
Corn, bu.	209,136,000	216,702,000
Wheat, bu.	15,962,000	13,865,000
Oats, bu.	43,396,000	53,428,000
Soybeans (for beans), bu.	27,702,000	29,757,000
Rye, bu.	1,560,000	1,044,000
White potatoes, bu.	5,100,000	6,480,000
Barley, bu.	1,620,000	2,256,000
All tame hay, tons	2,602,000	2,809,000

tion was somewhat smaller. There was a shortage of rainfall in most parts of the state (6.48 in. at Indianapolis), though planting was late in many parts of the state owing to rainfall in the planting season. There was little damage from frost; damage to the corn crop by the European corn borer was estimated at about $8,000,000.

Manufacturing.—Practically all the manufacturing plants in the state were given over, in whole or in part, to production for the war. The munitions plants and plants erected for the manufacture of war machinery reached full production during 1943; the one exception was the munitions plant in Vermillion county, near Terre Haute, work on which was abandoned before the plant was completed. The total production of manufacturing plants of all kinds during 1943 was the greatest in the history of the state. Among the largest and most important products were munitions, aeroplane engines, propellers and other parts, bomb sights, landing barges, brass and rubber articles, fabricated aluminum, high octane gasoline, and medicines.

Mineral Production.—During the years ending June 30, 1943 and June 30, 1942, respectively, 10,508,027 (9,565,037) tons of coal were mined in Indiana; $10,847,020 ($9,127,060) were paid in wages to a total of 5,678 (5,420) miners; there were 21 (12) fatal accidents in the 51 mines reporting; "strip" mines are not included in these figures; these have a substantial product.

In the first 11 months of 1943, 247 oil and gas wells were completed; the total production of oil was 4,866,500 bbl. (in the year 1942, it was 6,609,000 bbl.). (C. B. C.)

Indians, American.

Indian claims against the federal government for its failure to make adequate compensation for ceded Indian lands had been a long continuing problem. In some cases Indian lands were relinquished as a result of treaties officially negotiated, but never ratified by the senate. In other cases, treaties were ratified, but their terms were not fully carried out by the government. Sometimes there were errors in the surveys; sometimes whites were given title to lands which the Indians had never relinquished.

On Nov. 12, 1943, Secretary of the Interior Ickes ordered the restoration of more than 1,000,000 ac. of land within the ceded portion of the Wind River reservation in Wyoming—land which had never been sold even though the Indians had been deprived of its use. The court of claims rendered a decision on Aug. 4, 1943 affirming the right of the Confederated Ute tribes to more than 4,000,000 ac. of previously ceded but unsold lands in western Colorado.

For many years, the California Indians had a substantial claim against the government for lands confiscated in the 1850s as the result of treaties which were never ratified by the senate. In 1928, congress passed a bill permitting suit in the court of claims. Such suit was delayed until the accumulated offsets as the result of gratuity appropriations on behalf of the California Indians almost equal the claim. A bill was pending in congress in 1943 to provide an outright appropriation to the California Indians to right this long standing wrong.

On April 19, 1943, the United States supreme court confirmed the earlier decision of the court of claims, rejecting the claims of the Sioux Indians to the Black Hills of the Dakotas, formerly part of the Sioux reservations.

On June 11, 1943, a sub-committee of the Senate Committee of Indian Affairs issued a report (No. 310) recommending that the Indian bureau be abolished. Thirty-three separate recommendations were made, ranging from the disposal of the Indian Bureau library, the immediate closing of all Indian boarding schools, the elimination of the revolving credit fund, and the transfer of all Indian hospitals to the Public Health service, to the termination of federal trusteeship over Indian lands, and the immediate disbursement of individual and tribal funds of almost $70,000,000 dollars on deposit with the U.S. treasury. The most obvious aim of the report was to transfer the expenses of Indian administration from the federal government to the respective states and to open the Indian estate to dissolution. There was little evidence that the report would be implemented by congressional action.

On Sept. 7, 1942 the attorney general of Alaska issued an opinion to the effect that all children born in the territory of Alaska are eligible to attend the territorial schools without discrimination. He stated that while the federal government operated a number of schools for native children, this was a gratuitous service which the territory of Alaska could not demand as a right. This was a much needed interpretation of the Alaska statutes, for until recently the schools of the territory refused to admit full blood native children, although accepting without discrimination the children of mixed parentage. The attorney general further held that determination as to which of two schools, territorial or federal, a child shall attend is a matter of election by the parent and not by the school authorities.

Since all Indians of the United States were given full citizenship in 1924 they were subject to the draft as were all other citizens. However, a large percentage of young Indian men volunteered. Almost 20,000 Indian men and women were in the military service in 1943. All of the armed forces accepted Indians without discrimination, and they were to be found on every front. Through merit they won admission to officers' training schools and many held commissions. Indians constituted a large proportion of the infantry which fought with MacArthur in Bataan, and the 45th division which was in the van of the Sicilian invasion numbers more than 1,500 Indians. Almost every type of award for distinguished services in the army, navy or marine corps was won by Indians.

Despite the fact that they were among the poorest group economically in the United States, individual Indians purchased more than $1,164,000 in treasury and war bonds during 1943 and more than $2,000,000 of tribal funds was similarly invested. More Indians than ever before left the reservations to engage in war work.

In November, the department of the interior signed an agreement with the state of South Carolina and the Catawba Indians providing for the rehabilitation of the tribe. The state agreed to furnish funds for land purchase and improvement and to admit Indian children to public schools and state institutions of higher learning. The Indian service would furnish supervision and guidance.

After the purchase of Alaska, the natives opposed the establishment of reservations in the fear that this might endanger their citizenship rights. However, they found that the General Land office classified as public domain all land in Alaska which had not been either homesteaded or reserved, with the result that native villages, fishing sites and hunting grounds are in the public domain and subject to filing. As a result, numerous requests were being filed for the establishment of reserves to protect these native rights, which are of prehistoric occupancy.

Within the year, eight reserves of varying sizes were declared by the secretary of the interior under the terms of the Alaska act.

Industrial Health.

Events during 1943 convinced physicians in industry that rehabilitation and re-employment of the disabled were certain to occupy a large share of attention for years to come. The rate of discharges from the armed forces became sufficiently great to provide good insight into the general nature of these problems. Many physical defects unacceptable to the army or navy were found not to interfere in any way with very acceptable work ability. Through well-conducted programs of physical examination and job analysis, industrial physicians were finding it possible to match occupation and restricted physical or mental ability with excellent results. Veterans with a degree of disability which necessitated vocational retraining would obtain these services from the Veterans Bureau. Congress passed the Borden-LaFollette bill, assigning responsibility for rehabilitating nonservice connected disability to the Federal Security agency, using the established state rehabilitation services as major agencies of administration. Legal obstacles to employment of the handicapped were a source of concern to employers and physicians and interest was revived in securing proper relief through amendment of workmen's compensation laws.

The Chamber of Commerce of the United States appointed an advisory health council, one of whose subdivisions was to concern itself with extension of industrial health services. A vigorous attempt was made in Philadelphia jointly by the local chamber of commerce and the county medical society to bring good medical service widely to small plants in that area. A number of experiments in the provision of general medical coverage for workers in addition to necessary medical and hospital attention for compensable disability aroused considerable interest. These steps were necessary in many instances because isolated location or sizeable shifts in industrial population made dependable medical and health facilities in sufficient quantity unavailable. Considerable acceleration in industrial health activity by workers' organizations was noted, due in great part to freezing of wages and hours. The United Automobile Workers established a medical research institute to arrange for physical examination of workers, to investigate industrial environment, to provide health education and to assist in rehabilitation. Union health councils were being advocated as an expression of the workers' increasing interest in their own health.

In one instance, health and safety clauses were included in a proposed employment contract which called for joint labour-management control over industrial health services as well as general medical and hospitalization activities.

A laboratory of industrial hygiene was organized in the army, under the occupational hygiene branch of the surgeon general's office, to facilitate investigation and control over working conditions in arsenals, depots and ordnance plants.

Industrial Hygiene and Toxicology.—Industrial hygienists were still unable to keep pace with the industrial processes and materials that were being introduced, many without suitable toxicologic investigation. Some of the rarer metals came under scrutiny, such as selenium, tellurium and beryllium, and attention was called to potential risks. Warnings were also issued regarding the necessity for suitable safeguards against radium exposures in the currently important dial painting industry. In most respects, however, the bulk of control measures were, of necessity, directed at old offenders.

Industrial Medicine and Surgery.—Maintaining the work force at maximum health and efficiency was complicated mainly by shortages in trained personnel and continued influx of inexperienced or substandard workers into employment. Both of these factors were regarded as substantial contributing causes to increased lost time from accidents and occupational disease. Women in industry continued to present special medical and health problems which were the subject of several investigations. The greatest amount of lost time was found to occur in married women with associated home responsibilities, especially young children. Maintenance of day nurseries proved to be the best immediate solution, although they, in turn, served to produce their own health problems. Elsewhere it was advocated that employment of mothers with children under 14 be prohibited.

The techniques of tuberculosis case-finding in industry were vastly extended. Significant findings were uncovered in 1% to 2% of those examined.

The effects of aluminum dust on disabling silicosis were still under close and expectant observation. Inhalations of this dust were described as producing considerable symptomatic relief. No other essentially new therapeutic principles emerged in the medical and surgical management of industrial disability. Evidence began to accumulate that the X-ray appearance of certain welders' lungs was caused by depositions of iron which produce no functional impairment.

As in other years, personal illnesses not associated with work as a cause were still the most prolific cause of industrial absenteeism.

New occupational disease compensation laws were enacted in Arizona and Oregon. Kansas, Nevada, New Jersey and West Virginia authorized legislative commissions to survey occupational disease and the need for special remedial legislation. (*See* also ACCIDENTS; DERMATOLOGY; MEDICINE.) (C. M. PN.)

Industrial Production: *see* BUSINESS REVIEW; WAR PRODUCTION, U.S.

Infantile Paralysis.

During 1943, major outbreaks of infantile paralysis occurred in many parts of the United States. There were over 12,000 cases reported —the largest number since 1931—exceeded in magnitude only by the outbreaks of that year and 1916.

Through assistance from the National Foundation for Infantile Paralysis, Yale university, The Johns Hopkins university, the University of Michigan, the University of California, and the University of Southern California carried on epidemiological field work in the epidemic areas on a basis heretofore impossible. These studies gave added confirmation to the fact that the virus apparently is widespread in nature, being excreted through the intestine of both patients and healthy contact carriers. The virus was again demonstrated in sewage of large cities with serious outbreaks. It was also shown that cases diagnosed as infantile paralysis which occurred in the winter not only suffered from typical symptoms but were proven to be true poliomyelitis by recovery of the virus from the stools.

Many studies aimed at improvement of accurate diagnosis by use of laboratory methods were negative. No real progress in the production of induced immunity was reported during 1943. Several workers reported that in the experimental animal, resistance to artificially produced infection was increased when the nutritional state of the animal was markedly lowered. A significantly greater number of animals with good nutrition were paralyzed within a shorter incubation period than in those groups maintained in the poorer nutrition.

Laboratory studies showed that ozone was an efficacious viru-

cidal agent. It was also shown that the activated sludge process of treatment of sewage effectively inhibited or destroyed virus contaminated material. Improved techniques in the use of the ultracentrifuge allowed for accumulation of great quantities of highly concentrated virus. Histological study of poliomyelitis in the experimental animal demonstrated a heretofore described degeneration of the motor end plates of paralyzed muscles.

The outbreaks of 1943 afforded the first opportunity to apply on a large scale basis the method of treatment advocated by Sister Kenny of Australia. Most workers believed that the application of heat during the acute stages coupled with the earliest possible use of specialized physical therapy in an intensive manner lessened both the severity and duration of pain and contributed materially to the recovery of function with a minimum of structural deformities. (*See* also NERVOUS SYSTEM.)

Infant Mortality. Provisional reports of births and deaths in the first year of life indicate that infant mortality in the United States, Canada, and England and Wales for 1943 was the best on record. For the first time, the infant mortality rate for the United States fell below the level of 40 per 1,000 live births. In 1942, the last year of complete record, there were reported 113,418 deaths under one year of age and 2,807,445 births, so that the infant mortality rate was 40.4 per 1,000 live births. Records covering the first nine months of 1943 show a 7% decrease from the same months of the year before. Canada, in 1942, had 14,637 infant deaths and 271,981 births, so that the infant mortality rate was 54 per 1,000 live births. In London and the great towns of England and Wales, infant mortality for the first nine months of 1943 was 3% lower than for the same period of 1942. Deaths under one year of age in England and Wales as a whole in 1942 totalled 32,260; with 654,039 births, the infant mortality rate was 49 per 1,000 live births.

In 1942, Germany had an infant mortality rate of 66 per 1,000 live births, compared to 59 in 1941.

An analysis of infant mortality according to month of birth showed that the chances of survivorship to their first birthday anniversary are best for babies born in summer, which is also the season when most babies are born. The study was based on data for the United States covering the period 1935 to 1937, the latest years for which the pertinent records were available (Statistical Bulletin of the Metropolitan Life Insurance company, June 1943). Among babies born during the summer months, mortality from conditions largely congenital in nature, such as stillbirth, premature birth, congenital debility, and congenital malformation, was at a minimum. This was taken to indicate that summer babies are constitutionally stronger against the hazards of early infancy than babies born in other seasons. But, in addition, the study indicated that the summer is the best time for a baby to be born. This conclusion was based upon the variation in mortality from environmental causes (all other than those specified above) according to month of birth; this also tended to have its low point for babies born during the summer.

Although it was commonly believed that health conditions are better in rural sections than in urban communities, the contrary situation was found in a study of infant mortality in which both births and deaths were duly allocated to the regular place of residence of the mother. Thus, it was observed that in 1941 the infant mortality rate among the white population in cities of 100,000 or more was, on an average, 33.7 per 1,000 live births. In cities of 10,000 to 100,000, the average rate was noticeably higher, namely 40.3 per 1,000, while the poorest showing was made by the aggregate of towns and villages of 2,500 to 10,000, the rate being 46.6 per 1,000; the rural sections, as a whole, had a rate of 45.0 per 1,000. The better showing of the large cities may be attributed to the accessibility of maternity hospitals and facilities especially designed for the care of pregnant women and newborn children, to the ready presence of specialized physicians, and to the availability of nursing services. In order to improve the situation in rural sections, the states were being encouraged to develop and expand maternity centres in the less densely populated areas. The initial step in this direction was provided for in the Social Security Act of 1935; another important step was taken when the congress appropriated funds, in 1943, to provide medical, hospital and nursing care for the wives and babies of men in the lower ranks of the armed services.

Considered according to race, the infant mortality rates per 1,000 live births in the United States for 1941, the latest year with data available, were: white 41.2; Negro, 74.1. The recorded stillbirth rates per 1,000 live births were: white, 26.5; Negro, 55.4. The proportion of stillbirths not attended by a physician were: white, 2.7%; Negro, 39.9%. In 1941, there were 40.9 illegitimate births per 1,000 live births, the figure for the white population being 19.0 and that for all other races, 176.2.

A study of stillbirths in relation to age of mother and order of child at birth showed that the hazard of stillbirth is least among young women of ages 20 to 29 who are bearing their second child (*Statistical Bulletin* of the Metropolitan Life Insurance company, Oct., 1943). The chances of a stillbirth rise markedly with the age of the mother, particularly so in the case of first births.

A high frequency of stillbirths is also observed among women with large families.

Infant mortality rates per 1,000 live births for the principal causes of death in the United States in 1941 were as follows (the first figure relates to the white population and the second to all other races): premature birth, 12.6, 17.9; influenza and pneumonia, 5.6, 14.0; congenital malformations, 5.0, 2.5; injury at birth, 4.4, 3.5; diarrhoea and enteritis, 3.2, 7.1; other causes, 10.3, 29.8.

Ingersoll, Royal Eason (1883–), U.S. naval officer, was born June 20 in Washington, D.C., the son of Rear Adm. Royal Rodney Ingersoll. He was appointed to the Naval academy from Indiana, 1901, and after graduation was assigned to several U.S. warships. He was on duty at the Naval academy, 1911–13, when he received orders to join the Asiatic fleet. He went to the office of naval operations in 1916, and during World War I received the navy cross for his services in organizing, developing and directing the communications office of the navy department. Pres. Roosevelt in 1938 nominated him rear admiral, jumping him over the heads of a dozen senior officers. On Dec. 20, 1941, Secretary of Navy Knox appointed him commander of the Atlantic fleet to succeed Adm. Ernest J. King, who was designated commander in chief of the U.S. fleet. Under his command, in 1942 and 1943, the Atlantic fleet not only did extensive convoy duty but also played an important part in the invasion of North Africa, Sicily and Italy. On July 3, 1942, Pres. Roosevelt named Ingersoll for promotion to full admiral.

Ingram, William ("Navy Bill") (1897?–1943), U.S. marine officer and football coach, was graduated from the United States Naval academy in 1920. A star football player, he joined the navy after graduation, but resigned in 1922 to become coach of William and Mary college, Williamsburg, Va. He then accepted a contract as football coach at the University of Indiana in 1923, remaining there until 1925; in January 1926 he returned to his alma mater as football coach, a post he held for five years. He was then coach at California, 1931–34. In 1935, "Navy Bill" quit coaching, became an executive in a grocery chain and was sworn into the marine corps in Jan. 1943 as a major in the procurement division.

He died in Los Gatos, Calif., June 2.

Inönü, Ismet (ISMET PASHA) (1884–), Turkish statesman, was born in Smyrna (Izmir) on Sept. 24. At the age of 12, he entered an artillery school in Constantinople, later studied at the General Staff college, and had risen to the rank of a full general in 1926. During World War I, he saw action in Palestine against the British and was Kemal Ataturk's chief of staff during the campaign against the Russians in eastern Turkey. When the Greeks invaded Turkey in 1921, Inönü again acted as Ataturk's chief of staff. He defeated the Greeks twice at Inönü and took the name of the battlefield after Ataturk decreed that all Turks must have last names. When the Turkish republic was proclaimed on Oct. 29, 1923, Ataturk became president and Inönü was made premier. Although Inönü approved Ataturk's radical measures to westernize Turkey, he himself was more conservative and disagreed frequently with his chief. Inönü resigned unexpectedly in 1937, but after Ataturk's death in 1938, he was unanimously chosen president by the Grand National assembly.

During the early part of World War II, he carefully avoided offending either Germany or the U.S.S.R. In late 1943, he went to Cairo to confer with President Roosevelt and Prime Minister Churchill and on Dec. 7, the three leaders proclaimed the "closest unity" of Turkey with the United Nations.

Insurance. **Accident and Health.**—Accident and health insurance continued to show substantial gains in the United States in 1943, with an estimated 10 to 12% increase in premium income, bringing the total to approximately $400,000,000. About 55% of employed persons had some form of accident and health coverage, compared to 20% in 1934.

Group and payroll deduction coverages continued to show a marked increase, although the rate of personnel expansion in war plants was more stabilized. There was a great increase in insurance on employed women. Railroad ticket accident business showed a 35% increase to approximately $2,500,000 in premiums.

Caution in underwriting war workers and employed women was shown because of a probable decline in postwar earnings. Some advocated restricting indemnity in such cases to 50 to 60% instead of the usual 80%. In view of satisfactory experience on servicemen while still in the U.S., companies continued their liberal attitude in keeping policies of servicemen in force as long as they remained in the country. Plans were made for liberal reinstatement provisions without penalty for servicemen returning to civilian life. (C. D. SP.)

Great Britain.—Some contraction in the volume of accident and miscellaneous insurance continued during 1943, largely because of the drop in motor premiums caused by the laying-up of motor vehicles, and the operation of the 20% rebate allowed off private car premiums. This was accompanied by an improvement in the experience, and the accident results disclosed during the year were uniformly favourable. Road accidents tended to decline through smaller traffic and greater familiarity with blackout conditions. Workmen's compensation insurance expanded especially in the heavier industries, where the war effort required the payment of increased wages upon which insurance premiums were based. Periods of incapacity tended to be shorter in wartime with a consequent relief on the claim strain. Personal accident insurance was in demand in connection with certain classes of war work, but the ordinary business of this class was not in so great demand. (C. E. G.)

Automobile.—Automobile insurance premium volume in the United States was down about 20% in 1943. Most of this reduction was chargeable to the eastern territory, where severe gasoline rationing caused many private automobiles to be retired from service. In addition, further reductions in national rates meant less premium per unit insured.

The frequency of accidents continued to decline during 1943, as did the number of fatalities, but a marked increase in the number of persons injured per accident partially offset this reduction. There was also a definite increase in the cost per liability claim because of inflationary tendencies, and higher repair costs and automobile values had the same effect on property damage, fire and collision losses. In spite of these factors, the companies continued to show favourable underwriting results. (G. E. Ho.)

Fire.—There were two outstanding events in regard to U.S. fire insurance in the year 1943. The first was in regard to the War Damage corporation (*see* below). At the close of its first year, July 1, 1943, so few losses had been sustained that it was suggested that no premiums be charged for the next year; but this plan was not adopted. No serious losses occurred until Jan. 3, 1944, when the United States steamer "Turner" exploded, broke in two and sank off the northern part of the New Jersey coast. The explosion was so great that there was considerable damage to glass on the Jersey coast. Within a week public announcement was made in the press that the War Damage corporation would assume liability.

The second event was the adoption of the standard fire insurance policy effective July 1, 1943. This action occurred in the state of New York but the new policy, because of its simplicity

and its broader coverage, appealed to other states so quickly that at the close of 1943 it had been adopted by some thirty.

According to the *Insurance Year Book, 1943,* published by the Spectator company, premium receipts during 1942—the last year for which complete statistics were available—from all forms of underwriting—stock, mutual, Lloyds and reciprocal—amounted to $1,396,000,000. The total income including interest, rents, etc., amounted to $1,534,000,000. The losses paid amounted to $727,000,000 and the total disbursements, including all forms of expenses, amounted to $1,424,000,000. (*See* also FIRES AND FIRE LOSSES.) (E. R. H.)

Hospitalization.—Membership in nonprofit Blue Cross hospital service plans passed 13,000,000 by the end of 1943, enrolled in 77 plans in 36 states of the U.S.A. and 3 Canadian provinces. Enrolment of 500,000 new members during the third quarter of 1943 was greater than for any quarter in Blue Cross history.

The year 1943 was marked by a trend toward consolidation of plans to cover state-wide areas; by absorption of "single-hospital" plans in community-wide programs; and by extension of the movement toward uniform rates and benefits among plans. (A. G. S.)

Life.—During 1943, the legal reserve life insurance companies of the United States and Canada increased their investments in government bonds by about $3,000,000,000, an amount greater than the increase for the year in the companies' total assets. At the end of 1943, the total life insurance (excluding reinsurance) in force in these legal reserve companies was estimated at more than $146,000,000,000, about 7% greater than the amount outstanding at the end of 1942. New paid-for coverage issued during 1943 amounted to over $13,000,000,000. The assets of the companies at the end of 1943 reached an estimated total of more than $40,000,000,000, after paying or crediting to policyholders and beneficiaries about $2,600,000,000 during 1943.

The mortality experienced in the United States and Canada during 1943 continued favourable, although it was not quite as low as in 1942. War deaths resulting directly from enemy action comprised less than 2% of total deaths among ordinary policyholders during 1943, and a considerably smaller proportion among industrial policyholders. An increase in the mortality from pneumonia during 1943 marked a reversal of the sharp downward trend which had been in evidence each year since the introduction of serums and sulfa drugs in the treatment of this disease. The record for tuberculosis continued to be generally favourable. In spite of the increased industrial activity in connection with the war production program, the death rate from occupational accidents remained relatively stable.

The interest rate earned during 1943 on the aggregate of life insurance companies' assets followed the downward trend characteristic of preceding years. This reflected to a marked degree the low yield obtainable on government bonds, in which as much as one-third of the assets of the companies had been invested.

The year 1943 witnessed a legislative development of great significance to U.S. life insurance, in the enactment by some 14 states—as part of a nation-wide legislative program—of new standard valuation and nonforfeiture benefit bills. The proposed legislation was recommended by the National Association of Insurance Commissioners and endorsed by many insurance organizations. It provided for the use of modern mortality tables, and dissociated to a greater extent than did current laws, the minimum nonforfeiture value requirements from the policy valuation basis. It also provided a new method of determining minimum nonforfeiture values under which such values were more nearly related to the real equities of the policyholder at the time of default than had been true under existing nonforfeiture legislation.

The war was directly responsible for the incorporation of war risk provisions limiting the insurance company's liability in event of death while in military service. Prior to the entry of the United States into World War II, only a very small proportion of life insurance policies in force on citizens of the U.S. contained or retained any limitation of the life insurance benefits on account of war service or required the payment of extra premiums in such event. While the companies were therefore absorbing the war risk on practically all of their existing policyholders in 1943, the safety of the insurance of the general body of policyholders demanded that the companies take the necessary precautionary measures in respect to new insurance.

Marine and War Risk.—The war continued to be the most important factor in marine insurance during 1943. Many new ideas were adopted to enable underwriters to meet the needs of importers and exporters trading in wartime. One was the war risk extension clause which involved amending the terms of the war risk coverage to permit cargoes to be covered against war risk on shore at transshipping ports beyond the 15-day period originally allowed. Frequently ships were diverted from their expected routes and cargo was discharged for transshipment. If the goods were kept on docks or in a warehouse over 15 days before being loaded on an on-carrying steamer, the war risk insurance lapsed. All this might be without any knowledge of the owners, who automatically lost their insurance protection. To enable a shipper to have a war and marine risk cover that would be continuously in force from the start to finish of a voyage regardless of interruptions or transshipments, extension clauses were agreed upon and shippers acquired continuous protection. New rate schedules were adopted, combining in one additional rate the surcharge for the additional marine risks due to war conditions and the charge for the extended coverage at transshipping points. There was also issued a schedule of charges for the extended war risk insurance coverage, so that the shipper knew in advance exactly what his continuous cover would cost, regardless of all delays on the voyage.

Changes were made in the f.c. and s. clause in both the United States and Great Britain. The standard f.c. and s. clause in use throughout the world for many years read in part "Warranted free of capture, seizure . . . also from the consequences of hostilities or warlike operations." A number of disputes arose as to what was intended by the words "consequences of hostilities or warlike operations." Several types of losses, such as a collision in a convoy at night due to the ships running without lights, were capable of being interpreted either as war or marine losses. In the early part of 1943 the British Government War Risk bureau and British commercial underwriters agreed on a war coverage and a corresponding f.c. and s. clause for marine policies whereby all these borderline cases were to be considered as coming under marine policies and the war risk cover was limited to losses actually caused directly by a hostile act by or against a belligerent power.

The War Shipping administration and commercial underwriters in the United States were invited to agree to the new clauses, but the WSA, after consultation with the Office of Price Administration, declined to do this, as they feared it might result in higher marine rates on certain imported essential commodities on which they were endeavouring to keep prices down. Therefore, the WSA proposed a new definition of "consequences of hostilities" under which all these borderline cases would be considered war losses. This was the first instance in years where there was a difference in conditions in the ocean cargo policies issued in the United States and Great Britain.

Because war losses in the Atlantic on account of submarines decreased steadily during 1943, war risk rates also decreased. Cargo underwriters showed a profit on their war risk business, on which they had a heavy loss in 1942. Hull underwriters, however, had a poor year, largely because of the unprecedented number of collisions. Rates on renewals were increased, but did not keep pace with the increased losses due to operating under wartime conditions. A series of discussions between the War Shipping administration and the hull syndicate resulted in the "Wartime-hull Insurance Agreement (1943)," under which the syndicate agreed to insure U.S. privately-owned, ocean-going vessels, without any navigating limits or trading warranties, but subject to the new f.c. and s. clause excluding the so-called borderline cases.

(S. D. McC.)

War Damage.—By act of U.S. Congress approved March 27, 1942, Reconstruction Finance corporation had been authorized to supply War Damage corporation with funds in an aggregate amount not exceeding $1,000,000,000, for the purpose of providing through insurance reasonable protection against loss of or damage to property resulting from enemy attack or from the action of the military, naval or air forces of the United States in resisting enemy attack. To avoid the necessity of creating a complete governmental organization to handle the program, the corporation entered into separate agreements with 546 fire insurance companies pursuant to which such companies agreed to act as "fiduciary agents" for the corporation in receiving applications and premiums, issuing policies and otherwise handling the program. The participating companies had a 10% interest in the operating profits or losses of the program, subject to a limit of $20,000,000. As of June 30, 1943, premiums collected aggregated approximately $132,200,000, and it was estimated that approximately $136,700,000,000 of War Damage corporation insurance was in force on that date. In excess of 5,000,000 policies had been issued by the corporation.

Effective Dec. 21, 1942, the corporation had made available insurance on money and securities through the facilities of 88 casualty and surety insurance companies likewise acting as "fiduciary agents" of War Damage corporation. As of June 30, 1943, premiums from the money and securities program aggregated approximately $600,000, and it was estimated that approximately $3,200,000,000 of War Damage corporation insurance covering money and securities was in force under approximately 3,000 policies.

War Damage corporation was also authorized to compensate for loss or damage to property sustained during the period from Dec. 6, 1941 to July 1, 1942, without premium or other charge, subject to the limitations prescribed in the act. The corporation by 1943 had investigated and adjusted claims for loss sustained during this period as a result of enemy attack or action of the military, naval or air forces of the United States in resisting enemy attack in the Hawaiian Islands, Alaska and certain other areas within the geographical purview of the act. Practically all of the Hawaiian eligible claims had been paid by the end of 1943. The Alaskan claims were in process of adjustment and payment, as were certain marine claims. As of Dec. 18, 1943, $255,581.97 had been paid to compensate for loss sustained during the period from Dec. 6, 1941 to July 1, 1942. (W. L. C.)

Great Britain.—The various forms of insurance against loss or damage due to war risks were transacted during 1943 without any alteration in scope, but with certain revisions in premium rating. These revisions were mostly in a downward direction, because the course of the experience was much more favourable than during 1940 and 1941, when these insurance schemes first came into operation. The insurance of vessels or cargoes at sea, carried on partly by the War Risks Insurance office and partly by private insurers was rated according to a schedule, with varying rates according to the voyage. This schedule was revised several times during 1943, following the improved course of the war, and some substantial reductions were possible in rates for Mediterranean voyages and also in some parts of the far east. Atlantic voyages too could be covered at moderate rates.

Rates of premium for war risk insurance on land were made for set periods and fluctuated less often. Under the commodity scheme the rate of 5*s.*% per month, fixed on April 3, 1942, was reduced to 2*s.* 6*d.*% per month from March 3, 1943. After Dec. 3, 1942, policies could be obtained for three-monthly periods. Under the business scheme applying to trade plant, machinery and fixtures, policies were issued for six-monthly periods. The rate of 10*s.*% for the period fixed on Oct. 1, 1942, was reduced to 5*s.*% on April 1, 1943. Private chattel insurances ran for 12 months from any date, and in March 1943 the rates were fixed at 10*s.*% per annum on the first £2000, 15*s.*% on the next £1000 and 20*s.*% on the next £7000, being one-half of the rates previously in force. Inter-American Affairs, Office of the Coordinator of.

Operations of the U.S. Office of the Coordinator of Inter-American Affairs for 1943 group themselves into two broad classifications—wartime economic development work with related health, sanitation and food supply programs, and informational activities involving the press, radio, motion pictures and education.

A basic program was formulated to protect the health of armed forces at bases throughout the hemisphere, as well as that of war and agricultural workers in certain strategic regions of the American republics. Health and sanitation projects, developed by the United States jointly with the governments of 18 other American republics, included control of malaria and other tropical diseases, drinking water and sewage disposal projects, and programs for training medical and nursing personnel.

The food supply program for 1943 centred in regions of the hemisphere where the war made large military concentrations necessary. Migrations of workers to areas of strategic material production further aggravated food shortages. Agricultural experts, crop specialists and technicians were loaned by the U.S. to some of the other American republics.

Another important economic activity concerned hemisphere transportation problems, created largely by war disruptions. Cooperative projects were undertaken to solve these problems as well as those arising from greatly increased shipments of war materials.

The informational activities of the Coordinator's office furthered the exchange of all types of knowledge and information to aid mutual understanding and unity among the American republics. Wide distribution was given to news of inter-American significance. An illustrated magazine, *En Guardia,* was distributed in Spanish and Portuguese to a selected list of 500,000 subscribers in Central and South America, and a quarterly edition of this magazine was distributed in French in Haiti.

Radio coverage was also extensive. Besides news broadcasts—for which a special inter-American news report was provided 24 hours daily, seven days a week, other programs were broadcast or transcribed for rebroadcast. Special scripts dealing with the history, culture, resources, and war activities of Central and South American republics were furnished weekly during 1943 to more than 500 radio stations in the hemisphere. Wide use of

motion pictures was also made during 1943, particularly of 16 mm. educational and documentary films.

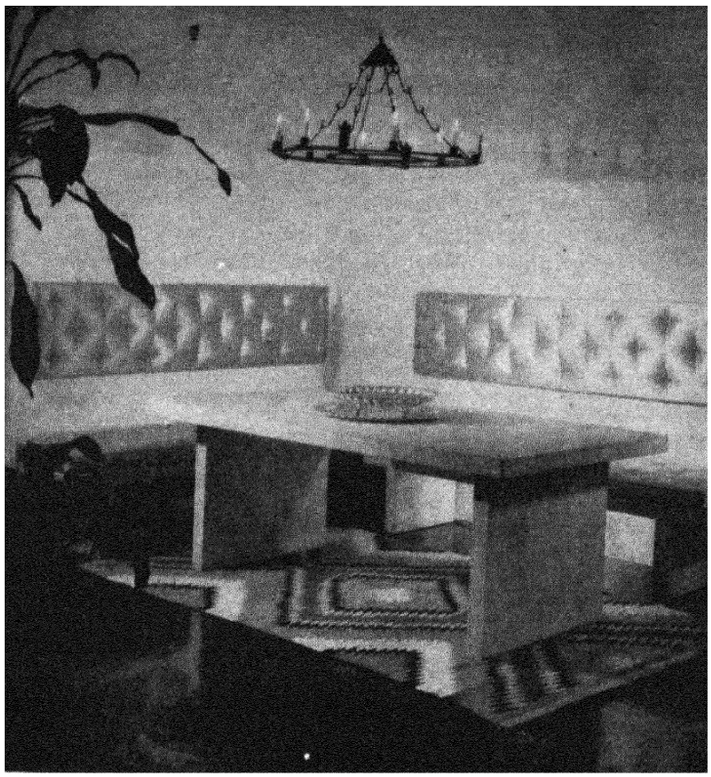
During 1943, the Inter-American Educational foundation was organized by the Coordinator's office to develop a program of hemisphere education. Co-operation was effected through the various ministries of education and through existing educational organizations.

A wide variety of inter-American activities were sponsored in the United States during the year through the establishment of Inter-American centres in strategic regional cities. Here reliable informational materials—pamphlets, motion pictures, graphic materials, exhibits and speakers—were made available for individuals and groups. (N. A. R.)

Inter-American Defense Board. The Inter-American Defense board represents a significant and definitely objective step in the evolution of inter-American co-operation, being the first attempt at collaboration in the military field through a body of representatives of all the American republics.

The board was established on March 30, 1942, pursuant to Resolution XXXIX of the Third Meeting of the Ministers of Foreign Affairs of the American Republics at Rio de Janeiro, Jan. 15–28, 1942, which recommended "the immediate meeting in Washington of a commission composed of military and naval technicians appointed by each of the Governments to study and recommend to them the measures necessary for the defense of the Continent."

The membership of the board is composed of distinguished army, navy and air officers, carefully chosen for their military and diplomatic experience. Numbered among the delegates are former chiefs of staff and former cabinet members. The headquarters of the board are in the Federal Reserve building in Washington, and it operates under the auspices of the Pan American union. The board holds its regular meetings on the second and fourth Tuesdays of each month, in addition to numerous meetings of its various committees. Its recommendations are transmitted in the form of resolutions to the governments of the American republics.



The organization and functions of the board are outlined in its regulations. Under these regulations, the chief of the delegation of the country in which the board is located is *ex officio* the chairman of the board. Provision is also made for a co-ordinator and a secretary general. Officers of the board in 1943 were: Lieut. Gen. Stanley D. Embick, U.S.A., chairman; Maj. Gen. Blanton Winship, U.S.A., co-ordinator, and Col. Edward H. Porter, U.S.A., secretary general. (B. Wp.)

Inter-American Highway: *see* Roads and Highways.

Interior, U.S. Department of: *see* Government Departments and Bureaus.

Interior Decoration. The field of interior design was limited in many ways during 1943 because of shortages and wartime restrictions. Building was still at a standstill, but the designing of interiors continued and showed considerable originality, with the trend more and more away from copying the traditional and toward original contemporary design. Restrictions on the manufacturing of furniture per se, that is, the general type, gave impetus to designers to break away from the usual and create new designs more suitable to the times. An outstanding influence was the influx of low cost war workers' homes which necessitated the designing of simple, easily constructed and inexpensive furniture.

The outstanding motive behind decoration was to create an atmosphere suitable for present day living, from which emanated a style that was comfortable, convenient and pleasing to the eye. For a more detailed description of the trend some of the important features of interior decoration are outlined below.

U.S. SOUTHWEST DESIGN was a new trend in interior decoration in 1943. The table in this dining room is of native New Mexican pine, the banquettes of yellow satin and the chandelier of wrought iron. The Navajo rug has brown, yellow and black shades

Wall Treatment, Interior Trim and Floors.—Walls were most frequently painted or papered though wood panelling, and prefabricated wood veneers on wallboard were increasingly popular. Woodwork was either painted or of the same material as the walls. Various hardwood and tile flooring continued to be used extensively.

Floor Coverings.—Carpets and rugs were predominantly plain. Selection of material and colour was very limited, the colours running to the lighter shades, and cotton textures were more accessible than the ever popular wool floor coverings. Textured weaves continued to be most popular.

Window Treatment.—Windows were treated simply, the object being to make them harmonious with the room. A draw curtain usually covering the entire wall where windows occurred was a satisfactory treatment as it could be drawn aside to allow full benefit of light and air or when closed give a continuous line around the room. With a strip of fluorescent lights concealed above the curtains a soft, diffused light gave an interesting effect when the curtain was drawn at night. Materials were generally plain light weight, often textured, cottons or cotton and artificial silk mixtures in colours blending with the walls. Printed chintzes and cottons were still seen though not so frequently as in former years. Venetian blinds were still popular though they began to be supplanted to some extent by the draw curtain.

Furniture.—Furniture designed to fit the needs of contemporary living was increasingly evident. Simple functional pieces formed the setting of most interiors with units built in where convenient, allowing more space and creating unity between furnishings and architecture. The scale of furniture was lighter and less massive than that of former years. Light wood finishes such as pine, birch, bleached walnut and mahogany were the most popular.

Furniture Coverings.—Fabrics were affected by wartime restrictions in many ways, thereby limiting the field somewhat.

Colours were limited and new designs were infrequent as the materials themselves were so difficult to obtain. There were few new upholstery fabrics. Plain, textured weaves and bright floral prints continued to be seen most often.

Decorative Accents.—Lamps and other decorative accessories followed the trend of the time and remained simple and functional. Unexaggerated forms and clear, bright colours gained importance over the more elaborate, intricate bric-a-brac seen so often in previous years. Old Chinese pottery fitted in well with the simple contemporary interiors, and a Chinese influence was often felt in their decoration. Various types of plants, such as large tropical varieties, played an important part in giving an interesting, livable atmosphere to homes. (G. M. J.)

International Labour Conference: *see* INTERNATIONAL LABOUR ORGANIZATION.

International Labour Organization.

Temporary headquarters of the I.L.O. continued to be at Montreal.

Merchant Seamen and the War (Studies and Reports, series P., no. 5, pp. 154) made public for the first time the proceedings of a session of the Joint Maritime commission—the 12th, London, 1942, at which this body of shipowners and seamen adopted a set of proposals for safety measures for seamen in wartime, many of which were put into force by the governments of the United States and Great Britain. It brought a step nearer the realization of an international maritime charter to be embodied in and enforced as an I.L.O. convention. Much work was done by the I.L.O. at the request of the Joint Maritime commission to secure wider ratification of the I.L.O. maritime conventions.

The consultative subcommittee of the J.M.C. met in London in May and urged more rapid implementation of the resolutions of the J.M.C. affecting the life and work of merchant seamen. The governing body and the office agreed to press for further ratifications and to study the possibility of ratifications on the basis of collective agreements, to continue collection of information on the development of safety measures in wartime, to urge representation of the shipping industry, along with the I.L.O., at the peace conference, and in every way to carrying out the resolutions of the J.M.C. They brought to the attention of the governments of member states the resolutions of the J.M.C. and asked for detailed information on the measures taken or contemplated on ensuring equality of treatment between seafarers, and on the subject matter of other resolutions. The governing body decided to convene the next session of the J.M.C. in 1944.

Other meetings of importance held in 1943 by or with the active participation of the I.L.O. included: (1) The 7th Canada-U.S. meeting on labour supply, New York, Feb. 13–14, at which manpower development and labour-management were discussed on the basis of another important publication of the year, *Joint Production Committees in Great Britain* (S. and R., ser. A, no. 42, p. 74 and chart); (2) Conference of the Joint Canadian-American Women's Committee on International Relations, Montreal, May 15–17; (3) First Inter-American Population Congress, Mexico City, Oct. 12–21, at which Pierre Waelbroeck, chief of the labour conditions, employment and migration section, represented the I.L.O. and presented two papers: (*a*) "Migration Problems of Postwar Europe," based on *The Displacement of Population in Europe*, by Eugene M. Kulischer (S. and R., series O, no. 8, pp. 171) which had been prepared for, and edited by Waelbroeck's section, and published by the I.L.O. in Sept.; (*b*) "The Organization of Migration in Relation to Postwar Reconstruction"; (4) At a public hearing (June 11) of the enquiry into industrial relations and wage conditions, upon invitation of the Canadian National War Labour board, the I.L.O. presented a memorandum on the experience of other countries in regard to legal regulation of collective agreements, conciliation in labour disputes, the right to strike, etc.

The I.L.O. was represented by Acting Director Phelan at the first session of the council of the United Nations Relief and Rehabilitation administration at Atlantic City, N.J., in November at the invitation of Dean Acheson, its chairman.

In addition to the publications already cited, Studies and Reports issued in 1943 were: *Labor Conditions in War Contracts* (ser. D, no. 23, pp. 74) in revised edition; *International Standardization of Labor Statistics,* (ser. N, no. 25, pp. 169). Other important publications were: the first two issues of a new series of pamphlets on postwar reconstruction, *The Health of Children in Occupied Europe* (43 pp.); *Manpower Mobilization for Peace* (78 pp.); *The Co-operative Movement in the Americas* (59 pp.); *Labor Problems in Bolivia* (Report of the Joint Bolivian-U.S. Labor commission, Spanish and English texts, 96 pp.); and *Year Book of Labor Statistics* (1942, 7th year, 222 pp.); *Intergovernmental Commodity Control Agreements* (221 pp.).

The serials, the *International Labour Review* (monthly), and the *Industrial Safety Survey,* and the *Legislative Series* (about 900 pp. in 1943), both quarterlies, were continued at peak output, and reprints of many important articles in all three were widely circulated.

Great Britain ratified two conventions: No. 64, Contracts of Employment, and No. 65, Penal Sanctions, both relating to indigenous workers. This made the total number of ratifications on Nov. 30, 886.

The governing body of the I.L.O. held its 91st session in London, Dec. 16–20. After taking action on the tripartite basis on many of the far-flung services of the office in wartime it voted to convene the 26th session of the International Labour conference in Philadelphia on April 20, 1944, with the following agenda:

1. Future Policy, Program and Status of the I.L.O.
2. Recommendations to the United Nations for Present and Postwar Social Policy.
3. Organization of Employment in the Transition from War to Peace.
4. Social Security: Principles and Problems Arising out of War.
5. Minimum Standards of Social Policy in Dependent Territories.

Also significant was the maintenance of the continuity of French membership. The commissioner of labour for the French Committee of National Liberation, Adrien Tixier, a former assistant director of the I.L.O., occupied at this meeting the French seat on the governing body. The president of Haiti took steps to retain Haitian membership in the I.L.O. when its resignation of membership in the League of Nations would become effective. (*See* also CHILD WELFARE; LEAGUE OF NATIONS; REFUGEES.) (S. McC. L.)

International Law.

The problems of international law arising during 1943 revolved mainly about the development of economic war, which reached a point never heretofore known. Not only did this form of warfare impair many old conceptions concerning international law, but its results threatened to carry over into peacetime, and thus to make a restoration of friendly relations or economic peace difficult or doubtful. This process began in World War I. But in comparing the two wars, law, both between belligerents and between belligerents and neutrals, was then far more respected than it was in 1943.

The Connally resolution and those adopted at Moscow, Cairo and Tehran, also raised doubts about the future. While assuring unity of action during World War II, they promised "peace and security" after the war, to be obtained by the united force of the victors against "aggressors." "Aggressor" is a political, not

a legal term, and is usually identified with the dissatisfied. The attempt to produce peace by force, the "hue and cry" theory, undid the League of Nations. Russia, Great Britain and the United States seemed again to be subscribing to a theory which had demonstrated its war-provoking tendencies.

Economic War.—In the United States economic war began by the freezing of the bank accounts of citizens of Norway and Denmark (5 Fed. Reg. 1400) and then of all the European countries—except Turkey—after Germany overran and occupied much of Europe. Control was tightened by requiring reports covering all funds owned by aliens, resident or nonresident (T.F.R. 300). More than $7,000,000,000 was reported as owned by nationals of "blocked" countries. This "freezing" was designed to prevent American-controlled funds from reaching the axis powers, the military occupants of several countries, but also served to deprive the owners of access to their funds. This was even applied to residents of neutral countries, like Sweden and Switzerland—and, if proclaimed, residents of the United States—but was ameliorated by the extension of licences from the treasury. In March 1941, the so-called Lend-Lease act extended American governmental aid to countries fighting the axis, assistance amounting to over $18,000,000,000 at the end of Nov. 1943. In July 1941, the freezing of funds was extended to Japan and its nationals.

After the United States entered the war, the alien property custodian took over German, Japanese and Italian direct investments, amounting near the end of 1943 to some $130,000,000. In July 1942, an Inter-American Conference on Systems of Economic and Financial Control recommended to all the countries of this continent the liquidation of all local businesses friendly to the axis. At the same time, long blacklists of citizens or firms of nonenemy countries were prepared in the United States and Great Britain, by which nationals of those countries were prohibited from entering into any trade relations with the citizens or firms on the blacklist. In Britain, for example, 1,164 Swiss firms were blacklisted up to the end of 1943. These measures were independent of the so-called "blockade," designed to keep any commodities out of the hands of the axis powers. Resident enemy nationals might by proclamation of the president be interned for the duration of World War II.

These measures were directed not merely against enemy nationals or persons domiciled in enemy countries, but under the first and second war powers act were directed against those who were thought not to manifest "loyalty" to the Allied cause. (Americans of Japanese origin were evacuated from the west coast and subjected to restrictions.) It was a form of "boycott" which cut across national lines and might even affect citizens of the boycotting countries. How far the Latin American countries had acted upon the recommendation of the Inter-American Conference on Systems of Economic and Financial Control was not known at the end of 1943.

These measures irritated neutral countries considerably. The restrictions on the axis necessarily involved, as in World War I, restrictions on the importations allowed to neutrals. Sweden, Switzerland, Spain and Turkey were in continuous negotiation with both belligerents for permission to import needed materials, against an assurance that these materials would not reach the enemy. Switzerland was especially irritated at the Allied effort to limit closely the trade between Switzerland and Germany, which she contended was within her legal right and necessary to Swiss economic life. By penalizing Swiss firms for undertaking this normally privileged trade, Switzerland claimed that her independence was impaired. Since only a few countries in the world possessing overseas transportation facilities were in a position to apply blacklists and thus regulate to some extent the trade of neutrals, the question was raised as to the future of the small state, and whether its independence in time of war is more than nominal.

The fate of the sequestrated investments, direct and indirect, could not be determined in 1943. Probably all the belligerents seized or controlled enemy-owned property, giving an expanded definition to the concept "enemy." Few countries seemed to have confiscated the property. A newspaper report stated that Colombia nationalized axis trademarks, and the alien property custodian undertook to license to Americans patents owned by enemies and nationals of countries occupied by the enemy. Congress did not indicate a confiscatory policy. The Gearhart bill proposed confiscation while purporting to avoid that conclusion, by providing, as did Article 297 of the treaty of Versailles, that the enemy countries would compensate their own nationals for their losses. The author of the provision, ex-solicitor Nielsen of the department of state, doubted whether it ameliorated the obloquy of confiscation. Confiscation would impair, as Cordell Hull remarked, the interests of Amercian citizens and the future of foreign investment (letter to Senator Capper, 31 *A.J.I.L.* 680).

Nonbelligerency.—This term has come into common parlance without any clear appreciation of its meaning. It seems designed to indicate a neutral's status of favouritism toward one belligerent while yet avoiding participation in the war. For example, a neutral country, like some South American countries, undertakes to extend facilities to one belligerent, like the United States, which the law of neutrality would foreclose. The term received currency when Germany and Italy intervened in the Spanish civil war to help Franco defeat the loyalists. In itself it does not indicate what measures the nonbelligerent may adopt to express his favouritism. It is, therefore, not a legal but a political term. It beclouds the clarity which international law was designed to afford as to the status of any country in time of war. The unneutral acts committed in the name of nonbelligerency expose the nonbelligerent to the dangers of war. It is used to justify departures from neutrality and breaches of the law. If it conveys the impression that such breaches are privileged or lawful, it is deceptive. It is a further impairment of law.

The Doctrine of Nonrecognition.—The refusal to recognize facts, which bulks large in the philosophy of the new theory of identifying peace with the maintenance of the *status quo*, operated strangely in numerous American cases decided during the period 1940–43, in connection with the refusal of the United States to recognize the absorption by soviet Russia in 1940 of the Baltic countries of Estonia, Latvia and Lithuania, later militarily occupied by Germany. Numerous ships belonging to citizens of the Baltic countries were located in American ports. The soviet government, under its established principles, undertook to confiscate or nationalize these ships. Then commenced a series of suits by the old owners or, as their representatives, the consul of Estonia, Latvia or Lithuania, still recognized by the United States, as against some agent of the soviet government, both claiming title. Since the annexation was not recognized by the United States, the courts found one reason or another for refusing to recognize the title of the soviet agent. Since the old owner had nevertheless been in fact displaced, they declined to recognize him as the entitled claimant, either because he had failed to prove ownership or because letters rogatory would not be issued to the soviet supreme court, making inquiry into the fact of ownership. Sometimes the libellant was an agent of the soviet government whom the courts regarded as not the real party in interest. It might have been easier to refuse to recognize the soviet title to property in American waters on the simple ground that confiscatory decrees, even of a recognized government, operating on property in the United States, are contrary to American

public policy. Even this established doctrine is beclouded by *United States* v. *Pink*, 315 U.S. 203. The confusion entailed in American courts by the refusal of the U.S. government to recognize the soviet government down to 1933 was perpetuated by the cases arising out of the refusal to recognize the annexation by the U.S.S.R. of the Baltic republics. *See* H. W. Briggs, "Non-Recognition in the Courts: The Ships of the Baltic Republics," 37 *A.J.I.L.* 585.

Enemy "Native, Citizen, Denizen or Subject."—On Aug. 18, 1943, the United States court of appeals for the second circuit decided three cases interpreting the term "native, citizen, denizen or subject" of Germany under the Alien act of July 6, 1798, and clarified some of the legal conditions attaching to collective naturalization. Without stating the full facts of the cases, discussed in the opinions and in 37 *A.J.I.L.* 634, the court held that the annexation of Austria by Germany in 1938 could not extend German citizenship to a citizen of Austria who had left that country prior to the annexation and was a permanent resident of the United States. *United States* ex rel. *Schwarzkopf* v. *Uhl, District Director of Immigration,* 137 F. (2d) 898. They reiterated the oft-repeated doctrine, both of American and of international law, that personal election plays an important part in the effect of annexation on citizenship, and that departure from the country prior to annexation manifests an election not to be considered an "inhabitant" or to "remain" in the country. In another case, *United States* ex rel. *Zdunic* v. *Uhl,* 137 F. (2d) 858, a citizen of Yugoslavia, residing in Austria from 1922 until 1939, was apparently deemed not a "denizen" of Austria. That was a term of art known only in English law. In another case, *United States* ex rel. *Wakler D'Esquiva* v. *Uhl,* 137 F. (2d) 903, a person born in Vienna, though having left Austria in 1919, was deemed a "native" of Germany if, on proof, the United States was deemed to "recognize" the absorption of Austria into Germany. Since the department had both recognized and refused to recognize that absorption, it might be difficult for the district court to decide the issue on the criterion of recognition.

Provision was made by executive order 9372 of Aug. 27, 1943, exempting from the classification "alien enemy" all enemy nationals certified by the attorney general or the commissioner of immigration as persons loyal to the United States (*Bull.* D. S., Sept. 4, p. 155). At an earlier date, nationals of Austria and Italy were excused from registering as enemy aliens (M. Domke, *Trading with the Enemy in World War II,* p. 70).

Among the notable events of the year 1943 were:

The reciprocal exchange of patents between the United States and Great Britain, by which each country agreed to make nationally registered patents available to the other, for the duration of the war.

The German attacks upon Swedish vessels and deposit of anchored mines in Swedish territorial waters.

The exchange of notes by which the United States agreed with the United Kingdom and various dominions, including India, that each country may bring its prizes into and take prizes in the territorial waters of the other (*Bull.* D. S., Feb. 6, p. 133).

The agreement (*Bull.* D.S., Aug. 14, p. 96) by which, under reverse lend-lease, the British government undertook to compensate private owners for private property expropriated to build the naval bases leased to the United States on British islands off the American coast.

The agreement (*Bull.* D. S., Oct. 2, p. 230) by which Mexico agreed to make specific payments in execution of the award compensating American oil companies for properties expropriated by Mexico, an award which significantly left unmentioned the bases on which it was reached, including the crucial question of compensation for subsoil petroleum.

The declaration of the United Nations of Jan. 5, 1943 (*Bull.* D. S., Jan. 9, p. 21) by which the Allied governments agreed to regard as null and void all transfers of property made by nationals or residents of occupied countries to German nationals, a transfer which led Dr. Frank Munk to propose that the six great trusts organized by Germany from German and transferred property be left unimpaired, but stock ownership be vested proportionately in the countries whose nationals were thus expropriated or who voluntarily parted with their assets.

The warning of Sept. 21 from the department of state (*Bull.* D.S., Sept. 25, p. 207) to neutral countries against the acquisition of Italian properties or enemy-owned shares in Italian companies, which the United States and the United Kingdom reserved the right to treat as void.

The refusal of a New York court to permit a French national to replevin his securities from a New York bank, held in the name of the French branch, since there was no French government in existence after the German occupation to which application could be made for release of the securities (*Bercholz* v. *Guaranty Trust Co.*, 44 N.Y.S. [2d] 148 [1943]). The New York courts had previously held (*Bollack* v. *Société Generale . . .*, 263 App. Div. 601 [1942]) that they would not give effect to a French confiscatory decree purporting to confiscate the bank deposits in New York of French nationals who fled the country in 1940.

The treaty signed Jan. 11, 1943, by which the United States abandoned extraterritorial rights in China, including rights under the "Boxer Protocol" of 1901 (*Bull.* D. S., Jan. 16, p. 59). This policy has since been implemented by a statute repealing Chinese exclusion (Nov. 1943).

The decision of the house of lords in the case of the soviet corporation *Sovfracht* v. *Van Udens Bros.*, (1943) 1 All. Eng. Rep. 76, that a Dutch company of shipowners having an arbitration agreement with the charterers of their vessel, a Russian company, could not pursue the arbitration in England since, being domiciled in Holland, enemy-occupied territory, they were themselves deemed to have "enemy character," which was a question of domicile and not one of nationality or patriotic sentiment.

The decision of the probate divorce and admiralty division in the case of the *Lubrafol* v. *Owners of the Steamship Pamia,* (1943) 1 All Eng. Rep. 269, that when the plaintiff Belgian company removed its domicile to Pittsburgh under authority of a Belgian order in council three months before the invasion of Belgium, they had a commercial domicile in the United States and could not be charged with "enemy character," thus distinguishing the case from the *Sovfracht.* A somewhat similar decision was made by Conger, J. in *Chemacid* v. *Ferrotar Corp.*, 51 F. Supp. 756 (S.D. N.Y. 1943).

The trial of "war criminals" for atrocities committed was considerably agitated during 1943. The warning to neutral countries to refuse them asylum was not hospitably received. There is much critical literature on the subject, questioning the wisdom of such trials, on the argument that the trials might not be genuine, that executions by Allied or international courts might introduce a dangerous precedent, that execution or other sanctions might martyrize the accused, that it would psychologically do harm both to victor and defeated countries, and that it would make difficult a restoration of peace (*Cf.* C. Arnold Anderson, in [Dec. 1943] 37 *Am. Pol. Sci. Rev.* 1081). (*See* also PRISONERS OF WAR.) (E. BD.)

International Trade. International trade in 1943 was predominantly war trade carried on within three groups of countries almost completely insulated from each other by blockade and counterblockade. The first of these groups included the United States, Canada and the countries in the Latin American area, the United Kingdom and British countries outside of the western hemisphere, the U.S.S.R., the European neutrals and their possessions, the countries of the middle east, and Free China. The second comprised Germany, Italy, the European countries under axis domination, and the European neutrals. The third consisted of Japan and the countries under Japanese occupation. The European neutrals, which maintained trade relations on some basis both with the rest of continental Europe and with the countries outside the German and Japanese spheres, appeared in two of the groups; otherwise they were mutually exclusive trading areas. The oversea trade of Sweden, which had been conducted on a very limited scale through the port of Göteborg under British-United States and German surveillance, was interrupted in Oct. 1943, as a result of the denial by Germany to Swedish vessels of transit through the Skagerrak in retaliation for the withdrawal by Sweden of transit privileges for German troops and supplies through Sweden.

Very little was publicly known about trade within the areas under German and Japanese control in 1943. The trade of Germany with other European countries and their trade with each other was carried on under the terms of comprehensive trade agreements, payment being made through clearing accounts. There was considerable evidence that Germany was experiencing increasing difficulty during 1943 in meeting export commitments under these agreements. As a result, imports into Germany were curtailed in some instances, and large clearing balances against the reich were accumulated. The major development in 1943 affecting trade within the area dominated by Japan was the growing shortage of shipping. Because of the lack of transportation, the movement of strategic materials and foodstuffs was curtailed even where supplies were available. Output within the area was undoubtedly reduced also as a consequence of Japan's inability to transport materials and equipment to points of production.

The broad features of the foreign trade of the United States, Canada and the Latin American countries in 1943 were made pub-

lic and provided considerable information regarding the international trade of the United Nations group of countries, even though foreign trade statistics for many of them were not available.

United States foreign trade in 1943 was dominated by lend-lease shipments, which comprised approximately 80% of total exports, as shown in the accompanying table.

Total shipments in 1943 were nearly $13,000,000,000. The value of exports, which were exclusive of supplies destined for the armed forces of the United States in foreign countries, was 60% greater than the 1942 total and constituted a volume of shipments unparalleled in the history of international trade. Lend-lease shipments exceeded $10,000,000,000 during the year and other exports amounted to approximately $2,600,000,000, as compared with $4,900,000,000 and $3,100,000,000, respectively, in 1942. The reports of the president to congress on lend-lease operations indicated that an increased proportion of total exports from the United States in 1943 consisted of military items, although shipments of industrial materials and equipment and of foodstuffs continued very heavy.

The value of imports into the United States in 1943, amounting to approximately $3,400,000,000, equalled or surpassed the highest levels since 1929 despite the severance of trade with areas formerly furnishing almost half of total imports into the country. Exports for cash, *i.e.*, exports other than lend-lease shipments, were exceeded by imports during the year by approximately $750,000,000.

United States exports to countries outside the western hemisphere in 1943 consisted almost entirely of lend-lease shipments. By the same token, cash-purchase or commercial exports were concentrated almost entirely in trade with Canada and with Latin America. Judging from published records for the first ten months of the year, more than one-third of total exports in 1943 went to the United Kingdom and more than 20% to the U.S.S.R. Shipments to Africa, the middle east, and the Mediterranean area accounted for more than 10% of the total and those to China, India, Australia and New Zealand for somewhat less than 10%.

Exports to Canada (as shown in Canadian import statistics) accounted for another 10% or more.

Exports from Canada reached unprecedented levels in 1943, partly as a result of a greatly expanded war trade with the United States, and partly as a result of heavy shipments, largely without immediate payment, to the United Kingdom. Imports into Canada, of which approximately four-fifths were supplied by the United States, were also at record levels. Exports during 1943 exceeded imports by a margin without parallel in the history of Canadian foreign trade. Much of the export surplus was accounted for, however, by shipments to the United Kingdom financed under Canada's provision of $1,000,000,000 for mutual aid to the United Nations or in other ways not requiring immediate payment. Trade with the United States resulted in an apparent excess of imports, partly as the result of the inclusion of lend-lease deliveries to Canada by the United States for other than Canadian account.

United States Foreign Trade, 1939–43*

(In millions of dollars)

	General imports	Total exports	Lend-Lease shipments	Exports exclusive of Lend-Lease shipments	Balance of exports (+) or imports (−) exclusive of Lend-Lease shipments
1939	2,318	3,177	—	3,177	+859

The trade of the Latin American countries was maintained at high levels in 1943 despite an acute shortage of shipping which affected most of the area during the early part of the year. Exports, estimated at $2,400,000,000, were higher than in preceding years, largely as a result of the extraordinary volume of shipments to the United States, placed at $1,300,000,000 as compared with $1,100,000,000 in 1942 and an average of $600,000,000 in 1938–39. Aggregate imports into the Latin American countries, estimated at approximately $1,400,000,000, were at about the level of preceding years on a value basis. Of this total, $800,000,000 represented imports from the United States. Perhaps the most notable development of 1943 was the continued accumulation by the Latin American countries of gold and foreign exchange, estimated privately to have reached a total of $2,000,000,000 by the end of 1943. The balance of exports, which was the principal factor involved, was roughly $900,000,000. Of this amount, more than $500,000,000 was accounted for by the excess of exports over imports in trade with the United States.

Not even the totals of British foreign trade in 1943 were publicly known. It was apparent from available records of United States, Canadian and Latin American exports, however, that imports into the United Kingdom from these sources in 1943 exceeded imports from all sources in prewar years on a value basis. A high proportion of these imports consisted of military supplies, as indicated by data on lend-lease shipments from the United States. What the comparative levels of imports of civilian-type goods may have been could not be determined on the basis of publicly available information. Other evidence, especially the continued severity of rationing restrictions on food, indicate that imports of this character were below normal requirements.

British exports in 1943 were probably only a fraction of their prewar volume, although no definite figures are available. What must have been an enormous excess of imports over exports was financed by: (1) Lend-lease aid from the United States; (2) mutual aid from Canada; (3) further liquidation of British investments in certain countries; and (4) the accumulation of blocked sterling balances. It was estimated that blocked sterling balances were somewhere between £1,000,000,000 and £1,300,000,000 at the end of the year. (*See* also BUSINESS REVIEW; FOREIGN ECONOMIC ADMINISTRATION.) (A. MY.)

U.S. Trade Agreements.—On June 7, 1943, President Roosevelt signed a joint resolution extending for a period of two years from June 12, 1943, the authority to enter into trade agreements with foreign countries. During 1943 reciprocal trade agreements were signed with Iran, on April 8, and with Iceland, on Aug. 27. Conclusion of these two agreements increased to 28 the number of countries with which trade agreements have been concluded under authority of the Trade Agreements act. The 28 countries, in the order in which the agreements were signed, were: Cuba, Brazil, Belgium and Luxembourg, Haiti, Sweden, Colombia, Canada, Honduras, The Netherlands, Switzerland, Nicaragua, Guatemala, France, Finland, Costa Rica, El Salvador, Czechoslovakia, Ecuador, United Kingdom, Turkey, Venezuela, Argentina, Peru, Uruguay, Mexico, Iran and Iceland. On June 23, public notice was given of intention to negotiate an agreement with Paraguay. Negotiations with Bolivia continued. (D. AN.)

Interstate Commerce Commission. The Interstate Commerce commission, established Feb. 4, 1887, for the regulation of carriers engaged in U.S. interstate commerce on land and water, consists of 11 members appointed by the president. From its membership the commission selects its chairman (J. Haden Alldredge in 1943). On a virtual leave of absence as commissioner in 1943, Joseph B. Eastman was serving as director of the Office of Defense Transportation (*q.v.*) and Commissioner John L. Rogers was assistant director of that office, which also utilized the services of many of the commission's employees.

In 1943 the carriers subject to the commission's jurisdiction were called upon to carry an increasing burden of wartime transportation, and many changes in normal modes of operation and routing of traffic were necessary. Railroad freight traffic reached a new high record, and passenger travel also increased. Motor-truck and bus traffic continued to be very heavy. A number of motor-carrier freight lines adopted plans for co-ordination of their operations in order to save rubber, gasoline and manpower by avoiding duplications in service. Many motor carriers and a few water carriers were granted temporary operating authority to meet urgent needs for transportation service which could not be furnished by other means.

The commission's emergency powers with respect to railroad service proved to be of the utmost importance in 1943. The number of orders issued in the exercise of these powers exceeded that for any previous year. These orders were instrumental in preventing any serious or long-continued shortages of railroad transportation.

In the early part of 1943 the commission reopened for further hearing the proceeding in which it had authorized certain general increases in railroad freight rates in 1942. After further hearing it found that the increased rates were no longer necessary under current conditions. Accordingly the increases in rates were suspended until July 1, 1944. Moderate general rate increases for motor carriers in certain sections of the country were authorized in 1943. Hearings in the comprehensive proceedings relating to class rates and the basic classifications were completed in 1943.

Further progress in the financial reorganization of railroads under the Bankruptcy act was made during the year. In this way and by other means the railroads continued to reduce their funded debt and lighten their burden of fixed interest charges. A revised and simplified edition of the commission's accounting rules for steam railroads was issued in 1943. (J. H. A.)

Intestinal Disorders: *see* ALIMENTARY SYSTEM, DISORDERS OF.

Intoxication, Alcoholic. There is a growing volume of evidence that chronic alcoholic intoxication is the expression of a particular kind of neuroses, that the problem falls within the purview of the student of personality, and that treatment is essentially and finally a personal matter.

The medical writings for 1943 contained no new contributions for a better understanding or specific solution of chronic alcoholism. Contributions on the conditioned reflex treatment of chronic alcoholism continued to occupy attention. This treatment consisted of establishing, under institutional supervision, a reflex aversion to the sight, smell, taste and thought of alcoholic beverages, by means of chemically induced emesis.

The controversy of ambulant versus institutional treatment was revived. The former involved the use of benzedrine sulphate, the value of which was not fully established, and, also the activities of "Alcoholics Anonymous" that sought to engage the alcoholic in social activities in a nondrinking environment, and offered constructive ways of employing vocational abilities and leisure time through the advantage of mutual understanding and past experience. Alcoholism as a disciplinary problem in the military forces was the subject of comment.

Chemical tests for the presence of alcohol in the blood, as a diagnostic criterion of drunkenness, in connection with the prosecution of motor traffic violation, seemed to have passed the twilight zone of experiment and to have entered the realm of scientific dependability. Some courts of law still refused the admissibility of such evidence where there is absence of consent in submitting to such tests. Three states recognized by law the reliability of chemical tests for intoxication and their admissibility in evidence. Other courts, in the absence of specific legislation, admitted these results in evidence, and ways and means were being considered to make such tests compulsory. The supreme court of one state ruled that the test of intoxication is not the amount of liquor consumed, but the amount of alcohol in the blood. (*See* also LIQUORS, ALCOHOLIC; PSYCHIATRY.)

Iodine. No information was available on iodine in 1943, beyond the fact that the supply was sufficient to cover immediate needs for both war and essential industrial uses. The United States output was not reported after 1937, but it was known to have increased materially over the approximately 300,000 lb. reported in that year. (G. A. Ro.)

Iowa. A north central state of the United States, admitted as the 29th state on Dec. 28, 1846; popularly known as the "Hawkeye state." Area, 56,280 sq.mi., of which 294 sq.mi. are water. The population in 1940 was 2,538,268 with 1,084,231 listed as urban and 1,454,037 as rural. Native whites numbered 2,403,446, foreign-born whites, 117,245, Negroes 16,694 and other non-whites, 883. The bureau of the census estimated the population of Iowa on March 1, 1943, at 2,308,748, a decrease of 228,260. Capital, Des Moines (159,819 in 1940). Other principal cities: Sioux City (82,364), Davenport (66,039), Cedar Rapids (62,120), Waterloo (51,743) and Dubuque (43,892).

History.—There was no state election in 1943. Officers elected Nov. 3, 1942, all Republicans, continued in office during 1943: governor, Bourke B. Hickenlooper; lieutenant governor, Robert D. Blue; auditor, C. B. Akers; secretary of state, Wayne M. Ropes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker. John M. Grimes was appointed treasurer on Oct. 21, 1943, to fill the vacancy caused by the death of W. G. C. Bagley. The general assembly was in session from Jan. 11 to April 8, 1943. Among the acts passed was one providing "rules of civil procedure."

Education.—For the school year 1941–42 there were 357,049 pupils enrolled in the 10,204 public elementary schools, 133,885 pupils in the 1,006 public high schools and 1,918 students in the 27 junior colleges. There were 24,808 teachers in the public schools. The property tax levy for schools in the local districts for the year 1939–40 was $41,711,546.

Public Welfare, Charities, Correction.—The state appropriation for the year 1943–44 included $8,500,000 for old-age assistance, $500,000 for state emergency relief and $260,000 for child welfare and aid to the blind. The state maintained five

penal and correctional institutions with a total of 2,665 inmates and ten eleemosynary institutions with 11,130 inmates, as of July 1, 1943.

Communication.—As of July 1, 1943, there were 5,488.5 mi. of paved primary roads in Iowa and 3,092.7 mi. gravelled or otherwise surfaced. Construction work on primary roads for the fiscal year 1942–43 totalled $3,654,242 and maintenance $4,063,255. Of the secondary roads 46,967 mi. had been gravelled. At the close of 1942 there were 9,351.84 mi. of steam railroads in Iowa and 435.1 mi. of electric interurban tracks. Iowa has approximately 10,297 mi. of telegraph lines and 90,335 mi. of telephone lines, with 594,759 telephones.

Banking and Finance.—There were 102 national banks in Iowa on June 30, 1943, with deposits of $485,790,000 and resources of $515,517,000. The 542 state banks had deposits of $787,765,327 and resources of $845,261,046. The income of the state government for 1942–43 was $33,536,537 of which $19,475,960 came from a retail sales tax and $7,781,985 from the income tax.

Agriculture.—There were 208,870 farms in Iowa in 1943 with 34,650,845 ac. For the first eight months of 1943 Iowa farmers received a cash income of $1,021,898,000, an increase of approximately one-third over that for the same period of 1942.

On Jan. 1, 1943 there were 13,028,000 hogs on Iowa farms, 1,866,000 sheep, 5,422,000 cattle, 658,000 horses and 39,000 mules.

Table I.—*Leading Agricultural Products of Iowa, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	641,212,000	574,080,000
Oats, bu.	189,315,000	196,270,000
Hay, tame, tons	4,855,000	6,683,000
Soybeans (grain), bu.	39,300,000	35,451,000
Soybeans (hay), tons	144,000	212,000
Barley, bu.	1,035,000	4,158,000
Wheat, bu.	3,025,000	4,193,000
Potatoes, bu.	5,529,000	6,600,000
Rye, bu.	202,000	279,000

Manufacturing.—The total value of products manufactured in Iowa in 1939 was $718,531,801. There were 2,670 manufacturing establishments with 11,501 salaried employees who received $23,535,779 and 65,314 wage earners who received $73,466,119. Meat packing and butter headed the list of industries. War industries were built up at Burlington, Ankeny, Cedar Rapids and other centres.

Mineral Production.—In 1942 Iowa ranked 31st among the states in the value of mineral products. (R. A. GA.)

Table II.—*Principal Mineral Products of Iowa, 1940 and 1939*

	Production, 1940	Value, 1940	Value, 1939
Cement	4,605,886 bbl.	$7,641,163	$7,771,503
Coal	3,231,177 tons	8,045,630	7,503,000
Gypsum	487,379 tons	587,223	510,120
Sand and gravel	3,164,803 tons	1,852,285	1,299,449
Stone	4,013,740 tons	3,832,070	4,385,234

Iowa, State University of.

An institution of higher education at Iowa City, Ia., established Feb. 25, 1847. It was the first state university to admit women on equal standing with men. In March 1943, the university began training of army air force pre-meteorology students and in May the first of some 1,300 army specialized training cadets arrived for work in six fields. Civilian campus enrolment continued to decline, but with the specialized army units university faculty members gave instruction to some 4,700 persons. The U.S. navy continued to train cadets in a pre-flight program with a constant total average of 1,800, using facilities of two men's dormitories, the field house and sports fields. More than 100 men of professorial rank entered government war service and 6,600 alumni and former students in December were listed in the armed forces. For statistics of enrolment, faculty, literary volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Iowa State College.

Service to the armed forces and for the war effort continued and expanded at this land-grant college during 1943. In addition to carrying on regular undergraduate and graduate instruction in agriculture, engineering, home economics, science and veterinary medicine, the college had in training some 3,400 men in uniform at one time. New contingents added during the year included the navy specialized training program, the second stage of navy aviation training and the army specialized training program. The quota of sailors in the navy electrical, diesel and cooks and bakers schools was increased. The college also trained 90 young women in engineering for the Curtiss-Wright corporation. (For statistics of enrolment, faculty, library, volumes, etc., *see* UNIVERSITIES AND COLLEGES.)

Iran.

Known before March 1935 as Persia, a country of western Asia bounded on the east by India and Afghanistan, on the north by the U.S.S.R., on the west by Iraq and Turkey, and on the southwest and south by the Persian gulf and Arabian sea; ruled after 1926 as a constitutional kingdom. Ruler: Shah Mohammed Reza Pahlavi; premier (1943): Ali Suhaili. Area, *c.* 628,000 sq.mi.; pop. (est.), 15,000,000. Chief towns: Tehran (cap., 360,000), Tabriz (220,000), Meshed (140,000), Shiraz (120,000), Isfahan (100,000). Language, Persian; religion, Mohammedan.

History.—Tribal unrest in southern Iran provided an opportunity for German agents, who tried to direct it toward the sabotage of the lines of communication between the Persian gulf and the U.S.S.R. In August the government offered a substantial reward for the capture of any Germans living without permission in Iran, and early in the following month ordered the arrest of a number of Iranians believed to be conspiring with these agents. A few days later, on Sept. 9, Iran declared war on Germany.

Meanwhile the country had been assisted by the United States and Great Britain to play its important part in the war by providing a route for supplies to the soviet union. The United States army became, during 1943, the leading partner in the organization of transit across Iran, assuming responsibility for the operation of the Trans-Iranian railway from the gulf as far as the Russian-occupied zone, and supplementing with its own convoys the road service organized in 1941 by the United Kingdom Commercial corporation.

Internally, the rising cost of living and the recurrent local shortages of food still presented grave problems. There had been a bread riot in Tehran at the end of 1942, but the situation in the capital was subsequently eased by the creation of a single state bakery, distributing 160,000 loaves daily through 28 government shops. The Allies also supplied a quantity of grain, and the harvest promised well. The problems of inflation and of the unbalanced budget were tackled by Dr. Arthur C. Millspaugh, who returned to Iran in January as financial adviser, and who was empowered to make regulations having the force of law.

Qavam es-Saltaneh resigned the premiership in Feb. 1943 and was succeeded by Ali Suhaili, who continued in office until the autumn elections.

Two economic agreements were concluded during 1943 by the Iranian government—a reciprocal trade agreement with the United States, and a settlement of the royalties to be paid by the Anglo-Iranian Oil company at £4,000,000 a year for the duration of the war. The company's net profits for 1942 were more than double those of 1941.

At the end of November Tehran was the scene of the first three-cornered conversations between President Roosevelt, Marshal Stalin, and Mr. Churchill. These were followed, on Dec. 1, by a joint declaration of the three leaders which associated the United States with the assurances given to Iran by Great Britain and the U.S.S.R. in Jan. 1942. (For the text of the declaration, *see* UNITED STATES OF AMERICA.)

Education.—(1937) 4,939 schools; 273,600 scholars; one university at Tehran.

Banking and Finance.—Revenue, ordinary (1942–43) 3,137,866,000 rials; expenditure, ordinary (1942–43) 3,137,695,000 rials; foreign loan (Dec. 31, 1941) £930,541; public debt (Dec. 31, 1938) 98,900,000 rials; note circulation (Nov. 30, 1942) 2,554,000,000 rials; gold reserve (Nov. 30, 1942) 310,949,000 rials; exchange rate (May 31, 1943) 1 rial = 3.077 cents U.S.

Trade and Communication.—Foreign trade (merchandise) 1941–42: imports 1,802,400,000 rials; exports 3,405,600,000 rials. Communications 1938: roads fit for wheeled traffic, *c.* 8,700 mi.; railways open to traffic, 1,072 mi.

Agriculture and Mineral Production.—Production, est. 1937–38 (in metric tons): petroleum, crude (1940) 10,426,000; wheat 1,942,300; barley 706,900; rice 382,100; cotton (1940–41) 50,000; wool (1940) 15,500; beet sugar (1939–40) 25,200; tobacco (1940–41) 12,700.

Iraq.

An Arab state of the near east, between Iran, Syria and Arabia, watered by the Tigris and Euphrates; an independent kingdom after 1932, when the British mandate was terminated. Area, 116,000 sq.mi.; pop. (census Oct. 1934) 3,561,000 (est. Dec. 31, 1939), 3,700,000. Chief towns: Baghdad (cap. 400,000), Mosul (260,000), Basra (180,000). Ruler: King Feisal II; regent: Prince Abdul-Ilah; premier (1943): General Nuri es-Sa'id; language: Arabic; religion: Mohammedan.

History.—Throughout 1943 Iraq continued to be ruled by the government which Nuri Pasha Sa'id had formed in Oct. 1942. The government remained substantially unchanged in personnel.

The most important of the government's acts was its declaration of war on the axis powers (Jan. 16). In its official statement, the government accused the axis of a hostile attitude toward Iraq over a long period and of having tried to destroy the legitimate government and promote disunity. For this reason and also because it was in the interests of Iraq and of the Arabs to adhere to the declaration of the United Nations, the Iraqi government considered itself in a state of war with the axis.

IRAQI "QUISLINGS" In Germany—the Mufti of Jerusalem and former Premier Rashid Ali el-Gailani—appearing in public on the second anniversary of the British occupation of Iraq in May 1943. The photograph was sent to the United States through neutral sources

The other important political activity of 1943 was the establishment of closer ties with other Arabic-speaking countries, and especially with Egypt. In January the regent and prime minister and in March the king paid official visits to Cairo. In July the prime minister went once more in order to discuss with Nahas Pasha, the Egyptian prime minister, the question of union between the Arab peoples; he subsequently described the discussions as having had "important results." On the same trip he also visited Palestine, Trans-Jordan, Syria, and Lebanon, to discuss the same subject with the authorities, and made statements in support of the idea of a greater Syrian state.

In internal politics, 1943 saw a revision of the constitution designed to make possible more stable governments. This received the approval of parliament in June. Shortly afterward the chamber was dissolved, and a general election was held in October

The economic situation gave some cause for anxiety. There were inflationary tendencies, and wartime control of supplies was made difficult by the existence of a well-organized "black market." The government took severe steps to fight these evils; for example it drew up a "law for the reorganization of economic life," which set up a higher committee on economic life.

Education.—In 1938: elementary schools, government, 741; scholars 94,368; new schools opened 1938–39, 22; secondary schools 14; scholars 1,904; intermediate schools 48; scholars 10,611.

Finance.—Revenue, ordinary (est. 1941–42) 6,800,000 dinars; expenditure, ordinary (est. 1941–42) 6,700,000 dinars; notes in circulation (Jan. 31, 1943) 21,900,000 dinars; foreign assets reserves (Jan. 31, 1943) 23,400,000 dinars; exchange rate (1943) (currency based on sterling): 1 dinar = £1 sterling = approx. 403.5 cents U.S.

Trade and Communication.—Foreign trade, 1941 (merchandise): imports 6,948,000 dinars; exports, domestic (excluding crude petroleum) 3,906,000 dinars. Communication: roads open to traffic (1940), *c.* 4,000 mi.; railways open to traffic (June 1940), 947 mi.

Agriculture and Mineral Production.—Production 1938–39 (in metric tons): petroleum, crude (1940), 3,438,000; wheat 600,000; rice 360,000; barley 1,138,400; tobacco 4,000; wool (1938) 8,300; cotton (1940–41) 3,600; cotton seed (1940–41) 8,500.

Ireland: *see* EIRE.

Ireland, Northern.

Northern Ireland forms part of the United Kingdom of Great Britain and Northern Ireland but (since 1920) has its own parliament and executive, with limited powers for local purposes, though also represented in the imperial parliament by 13 members. Area 5,238 sq.mi.; pop. (June 1939) 1,295,000. Chief cities (pop. census 1937): Belfast (cap. 438,086), Londonderry (47,813). Language: English; religion: Christian (Roman Catholic, 33.75%; Presbyterian, 31.4%; Episcopalian, 27%). Ruler and national flag, as for Great Britain. Governor: the duke of Abercorn; premier (1943): Sir Basil Brooke.

History.—In spite of some labour unrest at the beginning of the year, the war effort of Northern Ireland developed rapidly during 1943. The number of registered unemployed persistently declined, reaching a record low level of 12,500 by mid-October.

On May 1 Prime Minister J. M. Andrews yielded to the pressure of malcontents within his own party and resigned his office. His place was taken by Sir Basil Brooke, who retained his former

position as minister of commerce and production. The cabinet was reconstituted as follows: minister of finance, Major J. M. Sinclair; minister of home affairs, William Lowry, K.C.; minister of labour, William Grant; minister of education, the Rev. Professor Corkey; minister of agriculture, the Rev. Robert Moore; minister of public security, H. C. Midgley. Only the attorney general (J. C. MacDermott, K.C.), the parliamentary secretary to the ministry of education (Mrs. Parker), the chief whip (Sir Norman Strong), and the parliamentary secretary to the prime minister (Sir J. Davidson) retained their former positions in the government.

Two Northern Ireland seats in the British House of Commons were filled in the course of the year. J. Beattie (West Belfast) became the first Labour M.P. to represent an Ulster constituency at Westminster, and V. Dermot Campbell retained the County Antrim seat for the Unionist party.

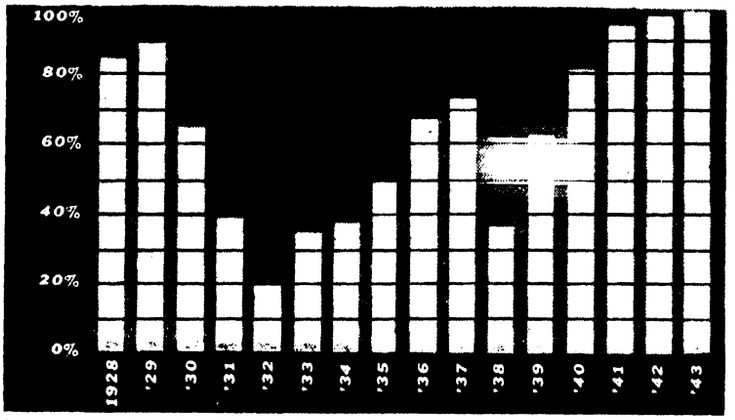
It was announced that the Belfast city administrators, appointed by virtue of the Belfast County Borough Administration act (1942), would shortly cease to hold office.

Considerable progress was made in the preparation of plans for postwar reconstruction. The Northern Ireland planning advisory board continued its investigations into postwar problems and in some fields the drafting of tentative plans was reported to be well advanced. On the initiative of the board, the ministry of home affairs began a detailed survey of housing conditions in the province. The planning commission (a body of experts mainly concerned with the more technical aspects of physical reconstruction) was reported to have prepared a master plan for the whole of Northern Ireland into which local authorities would be invited to fit their detailed plans for postwar building and redevelopment. Committees to consider the future of the linen industry and agriculture were also set up by the ministries concerned.

There was considerable public agitation during the year concerning the serious housing situation, particularly in Belfast. In spite of the fact that more than 44,000 war-damaged houses had been made habitable, the shortage of housing accommodation remained acute. In November the government offered a subsidy of £390 per house for the immediate erection of 750 houses in Belfast. (AR. B.)

Education.—In 1941–42: elementary schools 1,681; scholars 183,872; secondary schools 75; scholars 14,772; university students 1,626; technical schools 60; students 20,462.

Finance.—Revenue (est. 1943–44) £51,825,000; expenditure (est. 1943–44) (including £31,800,000 imperial contribution, and surplus £111,000) £51,825,000; 1942–43, estimated revenue, £41,797,000; estimated expenditure (including £21,300,000 imperial contribution, and surplus £84,000) £41,797,000; exchange rate (1943) £1 = 403.5 cents U.S.



Trade and Communication.—External trade 1938: imports, £54,385,000; exports, £51,061,000. Communication 1939: roads fit for motor traffic, 13,043 mi.; railways, standard gauge 741 mi., narrow 121 mi.; canals 180 mi. Shipbuilding, tonnage launched (1938) 79,468; value of linen goods exported (1938) £5,480,000.

Agriculture.—Total area under crops 1942, 1,263,131 ac., including 522,050 ac. cereal crops, 187,320 potatoes, 72,996 flax, and 435,429 ac. hay. Cattle 826,651; sheep 741,601; pigs 271,227; poultry 13,339,558. In 1941–42, cattle and sheep to value of £2,820,000, bacon and pigs to value of £2,480,000, eggs £3,500,000, potatoes £850,000, and fruit more than £500,000 were shipped from Northern Ireland to Great Britain.

Irish Free State: *see* EIRE.

Iron and Steel.

For convenience in coverage, this subject is subdivided into three heads—iron ore, pig iron and steel. Production data were suppressed by all of the major producers except the United States.

STEEL PRODUCTION in the United States; monthly average percentage of capacity (figures compiled by American Iron and Steel Institute)

Iron Ore.—Such information as was available in 1943 on world iron ore production is shown in Table I.

Production of usable iron ore in the United States in 1942 rose to 118,189,336 short tons, from 141,710,416 tons of crude ore, an increase of about 14% over 1941. The Lake Superior district accounted for about 90% of the total ore shipped. Production for the first three quarters of 1943 totalled about 90,000,000 tons of usable ore, of which the Lake Superior district supplied about 86%.

Lake shipments were hampered in the spring of 1943 by a late clearance of ice from the lakes, and again in the winter by early freezes. The November shipments were down to 6,940,503 tons, from 11,612,542 tons in the same period of 1942. Total shipments for the 1942 season, at 102,596,379 tons, cannot be duplicated in 1943, though ore consumption has been materially greater than in 1942, and the deficit has had to be supplied from other sources.

Although Canada is not normally a producer of iron ore, because of the ready accessibility of rich ores from the United States and Newfoundland, war demand led to several rather extensive new developments in Ontario, Quebec and British Columbia. All three provinces were paying bounties on iron ore,

to promote output.

Ore production of the Wabana mines in Newfoundland increased from 950,000 tons in 1941 to 1,200,000 tons in 1942, but exports declined from 1,235,000 tons to 980,000 tons, and the mine was closed for several months early in 1943 because of accumulated stocks.

Pig Iron.—In addition to the record of earlier years, as shown in Table II, the following text presents such later information as was available in 1943. The output of blast furnaces in the United States rose from 56,686,604 short tons in 1941 to 60,903,304 tons in 1942, including 59,077,544 tons of pig iron and 1,827,360 tons of ferroalloys. Ore consumption was 110,424,000 tons. The expansion program for new blast furnace capacity was about complete, 9 out of 10 furnaces under construction being scheduled to start operation before January 1, 1944.

Canadian production in 1942 included 1,975,015 short tons of pig iron and 213,636 tons of ferroalloys, a total of 2,188,651 tons. Through October 1943, Canadian furnaces with an annual capacity of 2,756,160 tons turned out 1,478,760 tons of pig iron and 185,480 tons of ferroalloys, a total of 1,664,240 tons, against 1,817,391 tons in the same period of 1942.

Spanish production was declining slightly, having been 580,771 metric tons in 1940, 536,865 tons in 1941 and 528,417 tons in 1942, and at a rate of 524,000 tons during the first quarter of 1943.

Steel.—As with pig iron, Table III shows past performance, and the text gives whatever later information was received.

Steel production in the United States in 1942 reached a total of 86,029,921 short tons, an increase of 4% over 1941. Plant operation averaged 96.8% of capacity for the year, with a high of 101.3% in October. The production goal for 1943 was 91,500,000 tons but this could not be attained, since the total through November was 81,589,202 tons, with a probable total of 89,000,000 tons for the full year. The chief reason for the failure to reach the desired total was the succession of four coal strikes during the year, as a result of which blast furnaces in several areas had to be banked during the strike periods due to shortage of coke. To a lesser degree, shortage of scrap was also a contributing factor, particularly during the latter half of the year. Purchased scrap constituted 45% of the total scrap consumed in 1942, but only 42% in August 1943. In an effort to remedy this shortage, an intensive drive for the collection of scrap was carried on during the last quarter of the year.

Steel production in Canada failed in 1943 to show the marked increase that had been made in 1942; production through Oct. 1943 totaled 2,509,712 short tons (a rate of 3,012,000 tons for the full year), in comparison with 3,121,361 tons in 1942. Scrap was more plentiful in Canada than in the United States, the scrap content of the furnace charge running better than 54%, against less than 50% in the United States. Irrigation.

United States.—Snow surveys made by the U.S. department of agriculture throughout the 11 western states at predetermined intervals resulted in irrigation water supply forecasts for the several basins of this area. These forecasts promised an abundant water supply for the entire irrigated west with the exception of southern Utah, Arizona and eastern New Mexico, where no serious shortage was forecast, but conservation was recommended. These forecasts proved to be very accurate, so that there was neither a reduction nor loss of irrigated crops.

War activities in the United States, as in all other countries of the civilized world, caused retrenchment or complete cessation of most civil improvements during 1943. Only such construction of new works or expansion of irrigated areas as were necessary to produce more food or fibre were undertaken.

On other than federal irrigation projects, the Imperial Valley Irrigation district led in major activities, although here, too, all operations were very seriously handicapped and had to be curtailed by reason of shortage of labour. This shortage affected all departments of this 500,000-ac. district but was especially serious in canal-maintenance work and drainage construction. The All-American canal continued to function satisfactorily except for the lower end. It was operated by the U.S. bureau of reclamation, since there remained minor construction work before the operation could be turned over to the district. For the power system of the district, there was a gradual increase in both power load and power sales during the year. Following negotiations of more than 12 months, the district took over ownership of the electric properties of the California Electric Power company as the result of a $6,000,000 issue of revenue bonds voted by the district. This was expected to greatly increase the efficiency of the district's power distribution system.

In general, the crop situation was quite satisfactory. Yields were good and prices above average. Some difficulty was experienced with farm labour, there being a serious shortage at times However, all crops were harvested with little if any loss from lack of labour. The co-operation of the Mexican government with

the government of the United States in supplying Mexican farm labour was very helpful. The total acreage of crops was about the same as for 1942. However, some shift was made from alfalfa and vegetables to flax. The area given over to the various crops in 1943 was as follows: Flax 144,618 ac.; alfalfa 114,085 ac.; garden crops 53,738 ac.; barley 32,848 ac.; rice 7,701 ac. All other crops, including sugar beets and citrus totalled 31,909 ac., making a grand total of 384,899 ac. farmed and irrigated within the boundaries of the district.

In central California the Nevada Irrigation district voted new bonds in the amount of $1,500,000, part of which was to be used to complete purchase of irrigation works and for the enlargement of the Bear River canal. The balance of the funds was for construction of Scotts Flat dam on Deer creek, extension of the Deer Creek South canal, and construction of the Combe-Ophir canal. Preliminary work was undertaken at the Scotts Flat dam —clearing the reservoir site and drilling the outlet tunnel, but actual construction was not to be undertaken until the conclusion of the war.

Federal irrigation activities continued to remain under the U.S. bureau of reclamation. As a result of the efforts of that bureau to bring about increased war-food production, the war board in 1943 lifted stop-construction orders on 13 of the bureau's irrigation projects on which the board had previously halted work in the fall of 1942, in order to save labour and strategic materials for strictly war purposes. The extensions of irrigation service on these developments, scattered over eight western states, were designed to provide water for 200,000 additional acres of land in 1944, 793,000 ac. by 1945, and a total of more than 1,000,000 ac. by 1946.

Work was halted in the fall of 1942 on practically all irrigation construction on bureau of reclamation projects. The War Food administration, which recommended the resumption of construction on the majority of the 13 projects approved, also made favourable recommendations on 13 additional projects and had under consideration about 50 others. From the 4,000,000 ac. already irrigated by the bureau of reclamation, crops valued at $272,000,000 were harvested in 1942. A crop value of at least that much was expected for the 1943 harvest. The bureau had 71 projects in operation, under construction or authorized, 52 of which were generating power or supplying water for irrigation or other beneficial uses. The storage capacity of 81 of its reservoirs in 1943 reached a new high of more than 64,000,000 ac.-ft.

Shasta dam on the Sacramento river, key structure of the vast Central Valley project (California), was about 90% complete. This structure was to contain 5,556,700 cu.yd. of concrete, and ultimately will be more massive than Boulder dam and higher than Grand Coulee. Two of five generators, each rated at more than 70,000 kw., were being installed.

The Green Mountain dam of the Colorado-Big Thompson project (Colorado), with its power plant of more than 20,000 kw., was completed early in 1943. Construction to increase the height of the Altus dam (Lugert-Altus project, Oklahoma) to supply additional water, was completed.

Other dams under construction in 1943 by the bureau of reclamation included Keswick dam (Central Valley project, Calif.), Wickiup dam (Deschutes project, Oregon), Anderson Ranch dam (Idaho), Deerfield dam (South Dakota), Jackson Gulch dam (Colorado) and the Newton dam and Scofield dam (Utah). In addition there were many smaller structures, including canals and aqueducts, under construction.

Argentina.—Irrigation systems are under federal and provincial control. In the most important and productive provinces the distribution works were constructed by the irrigators with some aid from the provincial government and in some cases from the federal government. In other provinces and in national territories, the federal government was the principal builder of irrigation works—in many cases to promote settlement in remote regions of the country.

A marked interest arose in all of the country in the construction of reservoirs for conservation and flood control, and new appropriations were authorized for construction of large dams. During 1942, construction of the Nihuil dam across the Atuel river in Mendoza province was started and continued into 1943. This structure was to extend and improve service to 172,900 ac. of land already partly irrigated. In the province of Córdoba, the San Roque, La Viña and Cruz del Eje dams were completed.

These dams are for irrigation, flood control and hydroelectric power.

During 1943 the national government also started construction on Cadillal dam (145,985 ac.-ft. capacity) and the Escaba dam (102,190 ac.-ft.), both in the province of Tucumán. These reservoirs were expected to permit the improvement and extension of the present irrigated area to a total of 172,900 ac. of sugar cane, tobacco and citrus in this sub-tropical zone.

Canada.—In 1935 there was set up in the dominion of Canada, a federal agency known as the Canadian Prairie Farm Rehabilitation administration, which had headquarters in Regina, Saskatchewan. This agency developed a water program for postwar years, to cost more than $100,000,000 and to involve reclamation work on the Canadian prairies. It was to include an enormous amount of dam construction and ditch-digging, affording employment for thousands of men and many contractors. Eight irrigation projects costing $17,000,000 were in 1943 ready for immediate construction after the war ends, while six more, to cost about $1,500,000, were virtually ready. Twelve more projects to cost an estimated $48,000,000 were in preliminary stage of development, while an additional six with an estimated cost of $15,000,000 were yet unsurveyed. The agency had in mind the development of another group for power and irrigation, which when completed would cost about $30,000,000.

Mexico.—After the creation of the Mexican Commission of Irrigation in 1926, it did much to promote irrigation agriculture in that country. During the period 1941 to 1946 it was planning new irrigation works to serve approximately 1,750,000 ac. This would bring the total to 2,500,000 irrigated acres, which it was estimated would affect a total population of over 1,000,000 people by the close of 1946.

As in the United States, the irrigated regions of Mexico were the only agricultural zones where it was relatively easy to balance agricultural production. It was intended, therefore, that these regions would serve as a central nucleus when agriculture in the postwar period would be co-ordinated with the economies of all the countries of the world and especially the Americas. There was evident a well-formed plan of development by the Mexican government to raise the living standards of the Mexican rural population.

Peru.—The Peruvian government approved plans for an irrigation project to cost $15,000,000. This project compared favourably in size with any in the South American countries, involving about 250,000 ac. Approximately half of this acreage was in 1943 only partially or inadequately irrigated and the balance in desert. The project was located just north of the Chimbote bay region on the western slope of the Andes. In the irrigation program there was to be also hydroelectric development of about 100,000 kw. from the flow of the Santa river. The development was expected to extend over a period of about 3 to 8 years.

Venezuela.—The government of Venezuela undertook from 1941 on a program of irrigation development. Five small proj-

ects completed would furnish irrigation water for about 29,640 ac., and it had under study and fairly well advanced in preliminary surveys, another group of projects totalling about 434,720 ac.

During 1942, Venezuela enacted a reclamation law which provided for the granting of concessions for use of water occurring on public lands under specified time-limiting conditions. Certain provisions also governed development and appropriation of ground water for use in irrigation. Reclamation was governed and directed by a Federal Water commission created by the 1942 Reclamation act.

Islam. The Islamic world after 1939 was affected by the war in common with the rest of the world. The figure for non-Arabian pilgrims at Mecca in 1942 fell to about 25,000 (19,000 in 1941), compared with nearly 60,000 in 1939. This was accounted for not only by the scarcity of shipping but by the unsettled political conditions in overseas countries. On the other hand, the progress of modernity in Islam was evidenced not only in Turkey but in India, Egypt, and North Africa generally. During 1943 the Moslem league in India greatly strengthened its position and extended its influence. El Azhar university in Egypt was exploring modern ideas and modern methods more and more and under the influence of its progressive leader, the Sheikh al-Maraghi, was finding considerable points of contact in Moslem theology with modern movements. The modern Arabic press was developing a technique of its own, and serving as a valuable link between historic traditions and modern needs. The intellectual confusion in France was helping in the emancipation of Moslem ideas in North Africa, which hitherto had been under French hegemony. The social services under the ministry of health in Turkey were proceeding actively with a ten-year plan which would give the lead to other Islamic countries. There were no notable literary developments of the ideas of modern Islam during 1943, but the Moslem press in Egypt and India continued to give support to reasonable progressive views about unity and inter-communications in the Moslem world.

Isle of Man: *see* BRITISH EMPIRE.

Italian Colonial Empire. The accompanying table gives essential information relating to the so-called Italian colonial empire. The year 1943 confirmed the virtual disappearance of the Italian colonial empire as such. Italian forces were driven out of Libya by the end of January and a British military government under Brigadier Lush was set up. Military courts were established to deal with espionage, looting, and violence, and all fascist organizations, both political and educational, were dissolved. The Italian civil and criminal courts were allowed to continue, and in Tripolitania, though some 4,000 prominent fascists had fled, enough Italians were left to staff the administration under British control. Food shortage was a considerable problem at first in Tripolitania owing to previous German looting, but the Italian colonists soon returned to their farms. In Cyrenaica the administrative problem was simplified by the evacuation of the whole Italian civil population with the retreating axis armies, and the farms there were worked by Arabs. The lira continued to circulate, together with the British military currency at the rate of 480 lire to the £.

In Albania, the conquest of which in 1939 had not been recognized by the United States and Great Britain, there were many cabinet changes during the first half of 1943, indicating the uneasy situation there. On Jan. 19 the Kruja cabinet resigned and Ekrem Libohova, a former foreign minister, formed a government; on Feb. 13 he was succeeded by Maliq Bushati (foreign minister 1939–41), but on May 12 Libohova resumed the premiership. On March 17 General Alberto Pariani became governor-general in succession to Jacomini. After the surrender of Italy in Sept. 1943, the Germans announced that Italian troops in the Balkans were being disarmed and that Albania and the whole Dalmatian coast were under the control of German and Croat troops. Throughout 1943 there were constant acts of sabotage and violence against the occupying authorities, and guerrilla fighting, in which Italians often assisted the Albanians, increased after the assumption of control by the Germans.

The Italian surrender also had grave repercussions in the Dodecanese. The garrison at Rhodes surrendered immediately to the Germans and, in spite of Allied landings during September and October on Leros, Cos, Castelorizzo and Kalymnos, the Germans gradually took over all the islands. At the beginning of October the Germans captured Cos and Stampalia, on Nov. 16 Leros was recaptured from the Allies, and on Nov. 19 they reported the capture from the Italians of Patmos, Lipso and Nicaria. (*See* WORLD WAR II.)

On Oct. 13 it was announced in the British parliament that an assurance had been received from the Badoglio government

Italian East Africa: *see* ITALIAN COLONIAL EMPIRE.

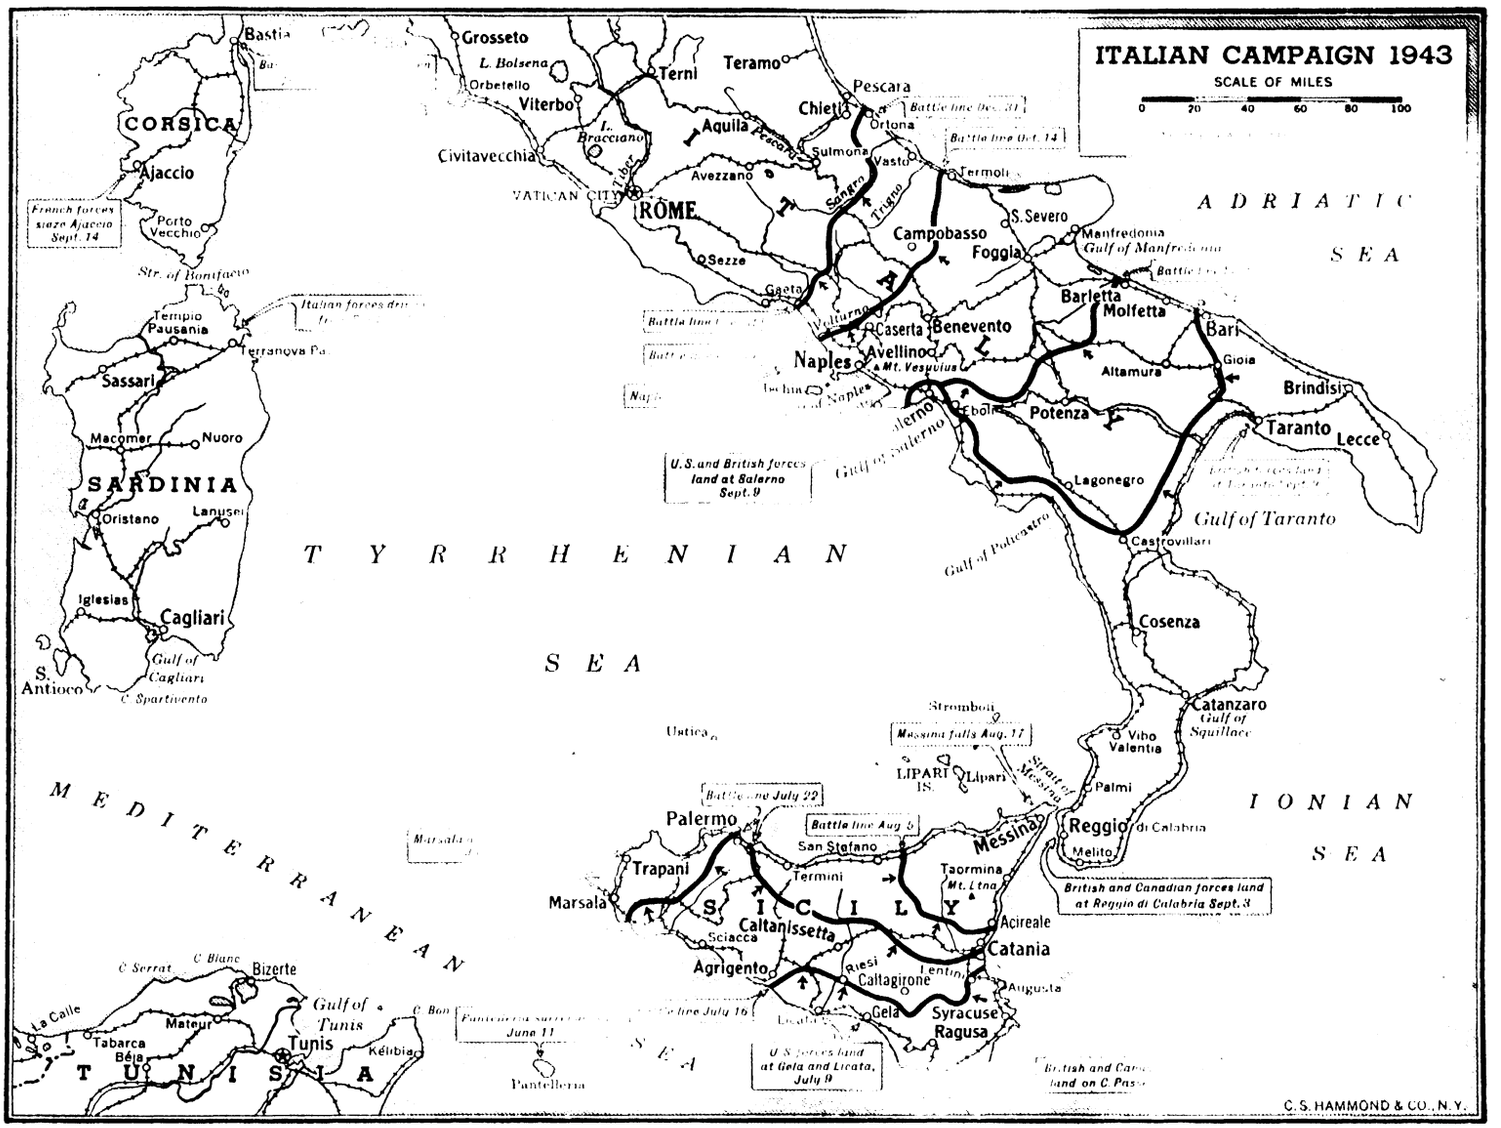
Italian Literature. Italy's emergence as a major theatre of war dwarfed by comparison every manifestation of the country's cultural activity. The bombing of Italian cities, the invasion of the peninsula, the downfall of the fascist government and the ensuing dislocation of the country's life made it virtually impossible to garner material sufficient for a fair estimate of the Italian literary output for 1943. However, from what little is known, it appears that nothing of distinction or importance appeared either in the field of drama or fiction. New editions of old novels, dating back to 60 years, served perforce as substitutes for the reading public. On the other hand, literary and historical research continued to hold a prominent place. The Regio Istituto di Studi Romani published Ciaceri's *Opera di Tito Livio e la Moderna Critica Storica,* besides a series of studies on the influence of Rome, over Greece, Rumania and other Latin countries. The Istituto di Studi Filosofici initiated publication of the *Edizione Nazionale dei Classici del Pensiero,* with A. Giuliano and E. Castelli as editors. This collection was to include rare and inedited works by outstanding Italian thinkers from the middle ages to our day. Under the title *Biblioteca Universale "La Meridiana,"* Sansoni brought out in various languages the first ten volumes of an ambitious series of the most distinguished contributions to art and science. V. De Bartholomaeis' compilation of religious plays of the 15th and 16th centuries, *Laudi Drammatiche e Rappresentazioni Sacre,* was published by Le Monnier. The Centro Di Studi Manzoniani sponsored M. Parenti's *Immagini della vita e dei tempi di A. Manzoni.* A. Bruers assembled in a single volume (Zanichelli) his scattered essays on literary criticism. An analysis of the personality and works of L. Chiarelli was published by M. Lo Vecchio Musti (Cenacolo).

The most significant works by Italian writers in exile included *What To Do With Italy* by Gaetano Salvemini and G. La Piana (New York); G. A. Borgese's *Common Cause* (New York); L. Weiczen-Giuliani's *Historia del Socialismo en el Siglo XX* (Mexico) and volume III of *Quaderni Italiani* (New York), devoted in great part to the role played by the Italian anti-fascists and the Vatican in the Spanish Civil War.

The meagre information which filtered through the press revealed that a strong reaction had set in against the young Italian writers who poured out the pent-up anguish of their turbulent adolescence in their books.

Still more vocal was the revulsion against the very pillars of the dictatorship: "propaganda, rhetoric, superficiality and confusion."

These healthy symptoms, together with the undercurrents perceptible in Italian literature after World War I, the return to militant liberalism by such men as the philosopher Benedetto Croce and Professor Adolfo Omodeo, President of Naples university, and the spirit which imbued the works of Italian writers in exile, were heartening portents of the revival which we may expect in Italian letters.



Fascism, during its 20 years of power, could not boast of a single outstanding fascist writer and did not succeed in leaving behind it a single literary work worth remembering and it was to the credit of the young Italian writers who preferred escapism or silence to the dictator's prizes and laurels. (M. F. C.)

Italian Somaliland: *see* ITALIAN COLONIAL EMPIRE.

COLUMN OF U.S. JEEPS heading inland after the initial Allied beachhead had been established near Salerno, Italy, Sept. 9, 1943

Italy. A kingdom consisting mainly of the peninsula projecting south into the Mediterranean from the mass of central Europe. The land boundaries, which reach as far north as 46°40′, are formed by France, Switzerland, Germany and Yugoslavia. Capital, Rome. Ruler: King Victor Emmanuel III. National flag: green, white and red in vertical stripes, with the arms in the white stripe.

Area and Population.—Excluding Libya: area 119,764 sq.mi.; pop. (est. Jan. 1, 1940) 44,815,000. Chief cities (pop. 1936): Rome (1,155,722), Milan (1,115,848), Naples (865,913), Genoa (634,646), Turin (629,115). Language, Italian; religion, Roman Catholic.

History.—By Jan. 1943, the Italian people had become thoroughly apathetic toward the war. Nothing that Mussolini did or said could make them otherwise. On Feb. 5 the duce forced the resignation of twelve members of his cabinet, including his own son-in-law, Count Ciano, and two days later he reorganized his entire administration. But no change in personnel could help now. The bread ration of his countrymen had fallen to one third below the lowest figure quoted for World War I; a swarm of British bombers constantly blasted Turin, Milan, and Genoa; Russian victories in the east decimated Italian divisions brigaded with nazi armies; and finally in May it was evident that the conquest of Libya and Tunisia by the Anglo-French-American forces during the first five months of 1943 had ended Italy's African empire.

By the end of spring invasion from Africa seemed imminent. But before Italy and Sicily could be attacked, it was first necessary to subdue the islet of Pantelleria, 40 mi. from Tunis, 65 from Sicily. This was accomplished, and exclusively by air assault, on June 11. One month later, July 10, the Americans and British invaded Sicily, which fell 38 days later.

Quite as important as this feat of arms was the deposition of Mussolini on July 25. The duce, it seems, at last demanded too many sacrifices for even the fascist grand council to accept, and by a sudden *coup d'état*, Marshal Pietro Badoglio arrested fascism's founder in the name of the king and spirited him away into captivity. Badoglio made a pretense of continuing the fighting, but soon agreed to unconditional surrender. When this was announced the first week in September, the enraged Germans occupied Naples, Rome, Milan, Turin and other cities. Riots promptly broke out everywhere in northern Italy but quickly were suppressed. Badoglio's government declared war on Germany but Mussolini, rescued by the German luftwaffe and backed by German bayonets, reappeared in Italy once more, claiming that he stood for an Italian republic. Italian soldiers in Croatia, Albania, Greece, and in the Dodecanese Islands were disarmed by angry German detachments. The Italian fleet steamed to Malta, losing one battleship en route by German bombing.

On Sept. 3 the invasion of the Italian mainland commenced as the British 8th army crossed from Sicily to the toe of Italy. The following week the American 5th army under Gen. Mark Clark landed at Salerno. The Americans had grave difficulty in securing their beachhead; the Germans, indeed, were so confident of victory that they announced that the Americans had been driven into the sea, and as a matter of fact this almost happened. It was a good ten days before Clark's 5th army could be considered firmly established on shore, and not until Sept. 17 did it make contact with the British 8th army marching up from the south against little opposition. The Germans retreated promptly to the north, making a shambles of Naples as they did so. That city

SHIPS BURNING in Palermo harbour, Sicily, during a German air raid which followed U.S. occupation of the city July 22, 1943. The hulks in the foreground are of axis ships sunk previously by Allied bombers

was the American objective, but so high were the mountains that stood between it and Salerno, that it was Oct. 1 before American troops occupied the important port. They found a wrecked city, the harbour junked with dynamited ships, water and lighting facilities ruined and a population starving, drawing its drinking water from the sewers. Even the library of the University of Naples was looted and ruined by the Germans, who also set time bombs in hotels and in the post office so that the maximum number of Italian and American lives might be taken even after the city was evacuated.

Meanwhile on Sept. 30 a conference took place on a British battleship between Gen. Dwight Eisenhower, Allied commander-in-chief, and Marshal Badoglio.

During the last quarter of 1943 the political question of what should be done to Italy and who should govern Italy attracted almost as much attention as the continuance of the war. Scarcely any Italians wanted Victor Emmanuel to remain as king, but some did believe that a liberal and anti-fascist monarchy under his son, or perhaps a regency for his grandson, would be the best solution for their country. This seemed to be the opinion of Count Carlo Sforza, Italy's foremost anti-fascist exile, who expressed himself as willing to collaborate with the monarchy but not with Badoglio. Other Italians, however, made it quite evident by mass meetings, or by attempted mass meetings (one of which was forbidden by the Allied military government in Naples), that not only Badoglio but the house of Savoy must be eliminated. Roosevelt meanwhile assured the Italian people that they would ultimately determine entirely for themselves their own form of government, and with this pledge even Stalin apparently was content, for the U.S.S.R. associated herself with Britain and the United States in a joint resolution to the effect that complete guarantees concerning freedom of speech, assembly, and the press, together with the final elimination of all traces of the fascist regime, must for the time being be considered subordinate to military objectives.

Those objectives soon became apparent as the British 8th army advanced up the eastern coast of Italy, securing after desperate German resistance the great Foggia air base on Sept. 28 and coming abreast of the American 5th army, which, with several British divisions attached to it, was pushing northward toward Rome.

Three months of steady fighting during October, November, and December brought both armies nearer their goal, but progress was slow. Torrential rains bogged down the invaders and the terrain was mountainous. As 1943 ended the Allies were still 75 to 80 mi. from Rome. (*See* WORLD WAR II.)

Education.—Public elementary schools in 1937–38, 131,580; pupils, 5,411,596. Students in secondary schools, 647,505; in universities, 77,429. A special school charter of 1939 required all education in Italy to have a fascist stamp.

Finance.—Estimates for year ending June 30, 1940: revenue, 24,560,000,000 lire; expenditure, 29,316,000,000 lire. Lira quoted Dec. 1939 at 5 cents; in June 1941, 5.262 cents.

Trade and Communication.—In 1939: imports, 11,061,000,000 lire; exports, 8,007,000,000 lire. Railways, 17,824 mi. Shipping: 2,301 sailing vessels, 1,057 steamships, 293 motorships. Total more than 2,200,000 short tons.

Agriculture, Manufacture and Minerals.—Livestock in 1938: horses, 791,120; asses, 791,390; mules, 431,150; cattle, 7,666,890; pigs, 2,940,440; sheep, 9,467,400; goats, 1,828,070. In short tons: wheat 1,369,000,000; maize 410,000,000; beans 179,000,000; olives 225,000,000.

Most important industry, textiles, with 938 factories in 1938. In minerals, sulphur continued to lead, there being mined, in 1938, 2,604,735 short tons, to 930,000 tons of iron pyrites, next competing mineral. Jacobs, William Wymark ("W. W.") (1863–1943), British author, was born Sept. 8, at Wapping, east London. He attended private school and for 16 years held a civil service post in a savings bank department. His books on seafaring men and dockyard hands, speaking through their characters, displayed a gentle humour and economy of style. Though his seamen were rarely at sea, their adventures or misadventures ashore provided many a thrilling tale. His first volume of short stories, *Many Cargoes* (1896), had an immediate success and was followed by two similar volumes, *The Skipper's Wooing* (1897) and *Sea Urchins* (1898). One of his most famous short stories, *The Monkey's Paw*, came to be regarded as a "horror" classic and was dramatized for the screen, stage and radio. An omnibus, *Snug Harbour*, containing some 17 volumes of his work, was published in 1931. Jacobs died in London, Sept. 1.

Japan. An empire, consisting of a chain of islands in the western Pacific, stretching from South Sakhalin (Karafuto) (50° latitude) to the South Seas mandated islands, which extend over a great expanse of the Pacific, some being located near the equator. The Japanese empire includes Chosen (*q.v.*) on the mainland of Asia and the small Kwantung leased territory, with the city of Dairen, at the tip of the Liaotung peninsula. Chosen, Formosa (Taiwan) (*q.v.*) and South Sakhalin, together with the South Seas islands, are administered as colonies. The area of the Japanese empire is 263,359 sq.mi., of Japan proper (the four large islands, Honshu, Hokkaido, Shikoku and Kyushu, with many adjacent smaller islands) 148,756 sq.mi. Population of the empire (census of 1935) was 97,697,555, of Japan proper, 69,254,148. An estimate of the Cabinet Statistics bureau placed the population of the empire at 103,087,100 on Dec. 1, 1937. The same source estimated the population of Japan proper at 72,875,800, as of Oct. 1, 1939.

Capital, Tokyo (*q.v.*). Japan's six largest cities are Tokyo (pop. 5,875,667, census of 1935; 6,581,100, estimate of 1939); Osaka (pop. 2,989,874, census; 3,394,200, estimate), Nagoya (pop. 1,082,816, census; 1,249,100, estimate), Kyoto (pop. 1,080,593, census; 1,177,200, estimate), Kobe (912,179, census; 1,006,100, estimate) and Yokohama (704,290, census; 866,200, estimate). Buddhism is the most prevalent religion, followed by Shintoism, the indigenous faith of Japan. There were 41,127,307 Buddhists in Japan in 1936, 16,525,840 Shintoists, 215,166 Japanese Christians of Protestant denominations, 111,856 Roman Catholics and 41,251 Greek Orthodox believers in 1938. U.S. and British missionary work was suspended after the outbreak of the war, but Japanese Christians remained free to profess their faith.

The Japanese sovereign is Emperor Hirohito. The prime minister during 1943 was Gen. Hideki Tojo.

History.—The second year of Japan's war against the western powers, which began with the attack on Pearl Harbor on Dec. 7, 1941, differed appreciably in strategic outline from the first. During 1943 Japan was entirely on the defensive. No major Japanese offensive was launched in any direction. The Japanese forces which had occupied Attu, in the Aleutians, were destroyed and a larger force, which had established itself on Kiska, in the same region, slipped away under cover of fog. Gen. Douglas MacArthur's campaign in northeastern New Guinea moved ahead. There were successful landing operations in New Britain, directed against the main advanced Japanese base of Rabaul. The last Japanese centre of resistance in the New Georgia group, Bairoka Harbor, was evacuated by the Japanese. The Americans occupied Vila, on Kolombongara Island, and effected landings on Bougainville, northernmost of the larger islands of the Solomon group.

An offensive from another direction was launched when a marine force late in November occupied the small Gilbert group of islands.

The balance of naval force in the Pacific during 1943 shifted so much in favour of the United States that it became a part of American naval strategy to tempt or provoke the Japanese main fleet into a decisive engagement by sending task forces to attack points well within the range of Japanese naval power.

Except for some stiffening of U.S. air support, there was no major change in the military situation in China during 1943. Japanese local attacks in the "rice bowl" area of China, in Hunan province, south of the Yangtze river, and in the rugged Salween river region of Yunnan led to no important results. No important city changed hands. The so-called Ledo road, being pushed into China from northern Assam under the direction of a U.S. engineering force, made further progress. American public opin-

THE SLOGAN "AAA" (Asia for the Asiatics) appeared throughout Japanese conquered territories in 1943

ion was shocked by the news in April that some of the aviators who had taken part in the Doolittle raid on Tokyo in April 1942 had been put to death after some kind of trial by the Japanese authorities.

While the territorial results of 1943 were much less favourable for Japan than those of 1942, Japan remained in possession of all its major conquests of the first months of the war. The Japanese hold on Burma was harassed by periodic air bombing, but there was no direct disturbance of the Japanese rule and exploitation in Malaya, the Netherlands Indies and the Philippines. The U.S. offensives were still on the outer periphery of Japan's enormously enlarged empire. Much more serious, from the Japanese standpoint, than the comparatively small territorial losses of 1943 were the severe losses in shipping as a result of activity of U.S. submarines and the increasingly unfavourable balance sheet of losses in air combat. (*See* also WORLD WAR II.)

Policy in Conquered Countries.—The apparent Japanese military decision to concentrate on holding what had been conquered rather than to launch new offensives was accompanied during 1943 by interesting political and economic moves in the vast area of southeastern Asia and adjacent archipelagoes which had fallen under Japanese military control. Japanese policy aimed at two main objectives: to make political capital by granting the show of independence and sovereignty to some of the countries which had been occupied and to draw as effectively as possible on the rich stores of strategic raw materials in which this part of Asia abounds.

Formal independence was granted to Burma on August 1 under a native government headed by a political leader named Ba Maw. There was a similar grant of independence to the Philippine puppet government headed by José P. Laurel in October. In neither case was there, of course, any withdrawal of Japanese troops or of Japanese supervision and control in all important matters. But the setting up of native governments in Burma and the Phi'ippines may have relieved the Japanese army of some of its policing tasks. Both in Burma and in the Philippines armed native units, the numbers and military value of which were difficult to gauge, were created. Japanese influence in these countries found expression in native parties, the Kalibapi in the Philippines and the Dabama Sinyetha in Burma. Thailand was rewarded for cooperation with Japan by a grant of additional territory, the four Unfederated Malay States (*q.v.*), Perlis, Kedah, Kelantan and Trengganu in northern Malaya and the Shan States in southeastern Burma. Here the motive was probably twofold. There was an attempt to appeal to Thai nationalism (Thailand, with Japanese collaboration, had already enlarged its territory at the expense of French Indo-China) and to give the Thai government an interest in resisting the reoccupation of this territory by United Nations forces.

No governments were set up in the Netherlands Indies or in Malaya; but Malay local councils were set up in these regions and a so-called all-Java cultural movement was launched under Japanese inspiration. A treaty of alliance was concluded with the Nanking government, headed by Wang Ching-Wei and, in an effort to split Chinese nationalist sentiment, the foreign concessions were formally returned to the authority of this regime, although Japanese military control remained unrelaxed. A further Pan-Asian move was the setting up in Singapore of a "provisional government of Free India," headed by the irreconcilable Bengal enemy of British rule, Subhas Chandra Bose.

Japan had set up a ministry of Greater East Asia, headed by Razuo Aoki, in Nov. 1942. Its task was to exert a centralizing and co-ordinating influence on the economic development of the occupied regions in the south. The Southern Development bank was created for financial operations in these regions and it was

U.S. AIRMAN, believed to be one of the Tokyo raiders, being escorted from a plane by Japanese after his capture. This picture was released by the Japanese through a neutral source in 1943 after their announcement that some of the captured U.S. airmen who participated in the Doolittle raid had been executed

stated that this bank would lend 3,300,000,000 yen for the needs of the military budget in 1943–44. This probably represented the value of the material which Japan planned to obtain in southeast Asia during the year in question.

While this part of the world is rich in many raw materials (rubber, tin, oil, quinine, sugar, to mention a few of the more important), lack of shipping and of adequate land transportation handicapped Japanese exploitation to a considerable extent. Japan by 1943 had not invested much capital in industrial development in the south, because the military hold on these new conquests was somewhat precarious, and the government's economic policy was to concentrate war industries within what might be called the inner ring of Japan's defenses, in Japan proper, Chosen, and Manchuria.

Internal Developments.—There were no drastic changes in the Japanese internal political set-up as a result of the great expansion of the war. Hideki Tojo remained head of the cabinet; a veteran diplomat and former ambassador to Great Britain and to the soviet union, Mamoru Shigemitsu, took over the portfolio of minister of foreign affairs in April 1943.

Besides the regular annual session of the diet, ending in March, there were two brief extraordinary sessions, in June and October, apparently designed to communicate to the deputies and through them to the people a sense of the gravity of the war situation and also to thresh out the details of a new system of government regulation of the major war industries. Plans for fire prevention and for the evacuation of the larger Japanese cities in the event of air raids were announced, and Prime Minister Tojo told the October session of the diet that Japan had built "an invincible fortification against invasion."

An Ordinance for Wartime Administrative Authority to Act was passed by the diet on March 17, 1943, and conferred on Tojo virtually dictatorial powers over production in the following key industries: aircraft, shipping, iron and steel, coal, light metals. Perhaps as a counterbalance to this extension of government control over business, seven representatives of big industrial and commercial firms were given *shinnin* rank (the first category in the civil service) and were appointed as cabinet advisers. This move was apparently designed to facilitate discussion at the top level between government and big business on vital issues of economic war mobilization.

A second exchange of interned civilians was arranged between Japan on one side and the United States, Great Britain, and Can-

ada on the other, after some difficulty and delay; and the Swedish ship "Gripsholm" brought a considerable number of repatriates back to the United States in Dec. 1943.

Education.—There were 48,637 schools of all types in Japan in 1938, with 15,638,780 pupils. There were 563 middle schools (the equivalent of U.S. high schools), with 364,486 students, and 45 universities, with 6,385 professors and 72,968 students.

Finance.—The unit of currency is the yen (officially valued at 23.48 U.S. cents before the outbreak of war in the Pacific). The budget for 1942–43 plainly reflected the tremendous strain of the war against the west. It called for expenditures of 30,000,000,000 yen and revenue receipts of 8,000,000,000 yen. The 1941–42 budget was set at 13,875,000,000 yen, of which 7,574,000,000 yen was raised through loans. The national debt was growing at a dizzy pace and at the end of 1943 must have been well in excess of the national income, estimated at 45,000,000,000 yen in 1942. Currency in circulation on Sept. 30, 1941: 4,619,000,000 yen.

The Bank of Japan is the central bank of note-issue. The Yokohama Specie bank is in charge of foreign exchange transactions (almost nonexistent after the outbreak of war with the west) and finances foreign trade. Commercial banking is mostly in the hands of seven large banks, which are closely tied in with the big Japanese trusts and cartels: the Mitsui, Mitsubishi, Daiichi, Sumitomo, Yasuda, Dai Hyaku, and Sanwa.

Trade and Communication.—Trade figures for Japan proper, excluding its colonies, were as follows:

	1939 (yen)	1940 (yen)
Imports	2,917,000,000	3,709,035,000
Exports	3,576,000,000	3,972,400,000

After 1940 there was no publication of detailed trade figures and after July 1941, there was almost no foreign trade, in the normal sense of the term. At that time the United States, Great Britain, and the Netherlands Indies adopted retaliatory economic measures, following the Japanese occupation of southern Indo-China, that brought Japan's trade with those countries to a standstill. Following Pearl Harbor Japan's commercial exchanges were almost entirely with countries under its direct or indirect military control. The only exceptions were a small trade with the soviet union, occasional exchanges of blockade-running cargoes with Germany and a trickle of trade with Free China across the loosely held front.

There were 16,549 mi. of state and private railways in Japan in 1938, 3,176 mi. in Chosen and 209 in South Sakhalin. The completion in 1942 of an undersea railway tunnel beneath the Kwannon strait, between the cities of Shimonoseki, in Honshu, and Moji, in Kyushu, eliminated the necessity of transshipment of troops and supplies across this narrow body of water.

At the end of 1939 Japan possessed 4,084 ships of over 100 tons, with an aggregate tonnage of 5,728,779 tons. As of Sept. 30, 1938, there were 17,791 sailing ships, average tonnage 1,046,476. U.S. naval sources estimated Japanese merchant shipping losses during the first two years of the war at 2,000,000 to 2,500,000 tons. No figures of Japanese ship construction were available after 1936, when 295,000 tons of shipping were turned out.

Commercial aviation continued in the hands of a semi-governmental monopoly, the Japan Airways Co., established in 1939 and capitalized at 100,000,000 yen. The length of its routes in 1938–39 was about 10,000 mi. The number of flights was 17,144, the aggregate length of flights 3,788,023 mi., the number of passengers carried 69,268, the quantity of goods conveyed 328 tons, the amount of mail carried 903 tons.

There were 13,648 telegraph stations in Japan proper in 1939, and 75,838,875 domestic and 1,261,295 foreign messages were handled in the year 1938–39. The length of the inland telegraph lines was 259,709 mi. in 1938. There were 6,197 telephone exchanges in Japan on Sept. 30, 1939, and 1,006,498 subscribers to telephone service.

Agricultural Production in Japan, 1940

	Cultivated area (acres)	Yield (tons)
Rice	7,837,888	9,999,308
Wheat	2,078,023	1,445,581
Barley	840,941	829,508
Rye	999,599	690,297

Agriculture.—Because of the pressure of population on the limited amount of arable land, Japan is a country of small rice and silk farms and fishing villages, with almost no large-scale farming with modern machinery and a minimum of animal husbandry. There were 5,519,480 farm households in 1938, and the amount of land under cultivation was about 15,000,000 ac., the average size of the holding thus being less than three acres. For several years before 1938 there had been a slight declining tendency in the number of farms; the cultivated area remained almost stationary. Rice has always been Japan's largest crop and represented about half the reported value of the country's agricultural produce in 1939. The total reported value, excluding meat, milk, and eggs, on which no data were given and which do not figure largely in Japanese farm output, was 5,614,000,000 yen. The value of rice produced in that year was 2,874,000,000 yen. The value of silk cocoons produced in 1939 was 883,000,000 yen. There were 1,894,261 cattle, 1,140,479 swine, 114,000 sheep, and 281,741 goats in Japan in 1938. There were 1,431,920 horses in 1936.

Manufacturing.—There were 112,332 factories employing more than five persons each in Japan in 1938, with 3,604,283 workers and an output valued at 19,667,219,686 yen. This was an increase of almost 20% over the value of production in 1937 and reflected the stimulation of the war industries because of the hostilities in China. The most important industries, and the value of their output in 1938, were as follows: metal (4,687,166,000 yen); spinning and weaving (3,984,829,000 yen); machinery and tools (3,821,881,000 yen); chemicals (3,460,581,000 yen); foodstuffs (1,786,275,000 yen); 1,442,713 persons were engaged in fishing in 1938.

Mineral Production.—Japan is poor in natural resources. Its principal minerals are coal (41,803,000 tons, valued at 305,537,000 yen); gold (784,308 oz., valued at 74,828,000 yen); copper (85,950 tons, valued at 66,617,000 yen). These figures are for 1936, since the publication of statistics of mineral output was forbidden after that year. On a percentage basis, mineral output in 1939 was about 20% higher than in 1936. Oil is a conspicuous deficiency in Japan's economy, although this was at least temporarily remedied by the conquest of the Netherlands Indies and Burma. There was a limited amount of oil in the northern prefectures of Honshu and experiments were conducted in manufacturing oil from coal in South Sakhalin and in extracting oil from shale in Manchuria. Jeffers, William M. (1876–), U.S. railroad executive, was born Jan. 2 in North Platte, Neb. He started work with the Union Pacific railroad in 1890 as an office boy. He was then telegrapher, clerk, dispatcher, trainmaster, superintendent and vice-president and, by Oct. 1937, president of the road. On Sept. 15, 1942, Donald Nelson, WPB chairman, made Jeffers head of the rubber administration and gave him the task of executing the Baruch committee's proposals for tire conservation, gasoline rationing and expansion of synthetic rubber production. Ten days after he took over, he ordered nation-wide gas rationing to save tires, effective Dec. 1. His whole background as a hard-hitting railroader made it easy for him to take literally the recommendation of Bernard Baruch that the rubber program "should be bulled through." He did exactly that. His directness, bluntness and force enabled him to do unpopular things with impunity. He battled army, navy, Sec. Ickes and others for priorities on equipment needed to make new plants—and got the priorities.

In May, Under Secretary of War Robert P. Patterson and Jeffers declared a truce in their high-octane gasoline *v.* rubber war and the two men formed part of a committee to tour U.S. war plants to speed production of critical materials and commodities.

Jeffers resigned on Sept. 4, saying that "the big job is done" and that he could serve the country better by returning to his old work as president of Union Pacific.

That month synthetic rubber production was 30,000 tons, about half the prewar consumption.

Jespersen, Jens Otto Harry (1860–1943), Danish philologist and educator, was born July 16 at Randers, Denmark. One of the world's outstanding authorities on English grammar, he was professor of English at Copenhagen university, 1893–1925, and lecturer at Columbia university, 1909–10. He devised an "interlanguage," Novial, in collaboration with the International Language association, which he explained in his book, *An International Language* (1929). He was the author of numerous books on language, its history and growth, and on English grammar, the most complete of which was his *Modern English Grammar* in four volumes. He died April 30 after an operation in Roskilde, Denmark, according to information received in New York city, May 15. (See *Encyclopædia Britannica.*)

Jesschonnek, Hans (1898–1943), German army officer, was born Dec. 10. A veteran of World War I, Jesschonnek served in the formidable German blitzkrieg armies of World War II and rose quickly to the rank of a colonel general. He was credited with organizing the Luftwaffe for the short Polish campaign in 1939 and was regarded with some fondness by Hitler. But an official German announcement in Dec. 1942 that Jesschonnek had been serving as chief of staff of the German air force since 1939 came as a complete surprise to Allied leaders. He had been little known and until this disclosure he was not regarded as a prominent figure in the German military. News of Jesschonnek's position came at a time when Hitler was reshuffling his army command because of the failure of his Russian campaign. The next heard of Jesschonnek was a Berlin radio announcement on August 20 which said that he had died "of a serious illness" at the headquarters of Marshal Hermann Goering.

Jewish Religious Life. The year 1943 brought to the Jew and Judaism a continued crescendo of horror. In the slaughterhouse of Europe, the struggle of a remnant of Jewry for sheer physical survival left little room for cultivation of Judaism after synagogues and Jewish communities were destroyed and the nazi's "extermination commissions" had annihilated an estimated 4,000,000 Jews.

Yet Jewish refugees were found in mountain caves with their scrolls of the Torah and religious books. Jewish religious life fell a sacrifice in countries such as Holland, Denmark and Italy.

The free Christian world, and even more strikingly Christian prelates and laity in axis-occupied lands, reacted not only in brave words of protest and denunciation, but also in action, such as in opening monasteries and religious organizations to shelter Jews. The Federal Council of Churches of Christ in the United States set a special day of compassion and prayer for the Jews of Europe, while American Jewry took on itself a six-week period of mourning and intercession. On the favourable side of the ledger the relaxation of the soviet's proscription of religion and the influx from Poland into Russia of traditional Talmudic and Zionist Jewish refugees opened up a new chapter in the story of Judaism in Russia.

Outside of Europe, Judaism suffered numerous setbacks. Sporadically in the United States synagogues were defaced with swastikas and cemeteries violated. The Quebec city council which for more than a decade opposed the building of a synagogue in the city, expropriated a site on which the foundations of a syna-

EXECUTIVES of the Jewish Agency for Palestine—rulers of all Jews in the mandate—in their headquarters at Jerusalem. At the extreme right is the chairman, David Ben-Gurion, a Pole

gogue were being laid. Jewish life in Argentina felt the government's repressive hand. The war continued to take men from synagogues, teachers from religious schools, rabbis from their pulpits. In the United States more than 200 Jewish chaplains were in the armed services.

Within the Jewish community there was warm discussion about such problems as the type of religious education to be given to the refugee children reaching Palestine, and the creation of the American Council for Judaism. This organization stressing Reform Judaism as a spiritual force to the exclusion of Zionist and other traditional and historico-cultural aspects of Jewish life, was denounced by the overwhelming majority of the rabbinate of the United States and was asked by the organized Reform rabbinate to disband.

Even in a world of war the Torah was still going forth from Zion, and from Palestine came the news of a projected new edition of the Hebrew Bible under the auspices of the Hebrew university, an encyclopaedia of the Scriptures and a new edition of the Talmud. Everywhere Jewish groups stressed the spiritual values which must come to expression in the postwar world if there is to be enduring peace. Thus the American Jewish conference, representing the totality of American Jewish life called "upon the members of the American Jewish community to strengthen their commitments to the synagogue and the agencies of Jewish culture in an effort to revive the broken spirits of our stricken brethren in Europe, to compensate for the destruction of their organized religious life, as well as to remain true to our historical heritage as a people. We call upon the members of the Christian communions in the United States to employ the immeasurable power of their faith to restore the presence of God in a world that has almost been destroyed by the agencies of evil." (*See* ANTI-SEMITISM.)

Jewish Welfare Board, National. Organized in 1917, the National Jewish Welfare Board is the sole organization authorized to serve the special religious, cultural and hospitality needs of the Jewish members of the armed forces of the United States. Authorization for its work with the military comes from two sources: from the war and navy departments of the United States government; and from 37 national Jewish organizations, representing every phase of Jewish life in the United States.

The board is the Jewish member of the United Service Organizations, Inc. (U.S.O.) and serves wholly or in part in 206 U.S.O. recreational facilities in the United States. The board also serves special needs of Jewish soldiers overseas. It enlists rabbis to serve as Jewish chaplains in the army and navy and grants them ecclesiastical endorsement. Other activities of the board include service to Jewish youth on college campuses; rehabilitation work to veterans of the American armed forces; special services to wounded soldiers and sailors in general hospitals.

In 1943 there was a professional staff of 297 serving at home and abroad. The program for the armed forces in 1943 was supported and amplified by army and navy committees in 480 cities in the United States and 27 communities overseas.

In 1943 there were 209 Jewish chaplains serving with the armed forces. These were helped by 297 J.W.B. field workers, by 200 civilian rabbis recruited by the board, and innumerable Christian chaplains. During the High Holy Days of 1943, they conducted 2,000 religious services in 34 countries, reaching more than 200,000 Jewish soldiers and sailors.

Other interests of the board are the National Association of Y.M.H.A.s, Y.W.H.A.s and Jewish community centres of the United States and Canada. Affiliated with the board in 1943 were 315 such organizations, with a total membership of 410,000 men, women, young people and children.

The Jewish Welfare board assists these organizations to provide wholesome recreation, informal educational activities, opportunities for self-improvement through participation in a variety of Jewish and general cultural pursuits. The affiliation of the J.W.B. with Associated Youth Serving Organizations (A.Y.S.O.) is in line with its interest in the welfare of children and youth.

Annual meetings of the board were suspended for the duration of World War II. Officers in 1943 were: Frank L. Weil, New York, president; Walter Rothschild, New York, chairman National Army and Navy committee; Mrs. Samuel Glogower, Detroit, chairman Jewish Center division; Mrs. Alfred R. Bachrach, chairman Women's division; Louis Kraft, executive director. Offices are at 220 Fifth ave., New York city. (F. L. W.)

Johns Hopkins University. An institution of higher education at Baltimore, Md.; president, Isaiah Bowman. During 1943 the university's wartime activities took a new turn with the introduction of the Army Specialized Training program, under which 500 army trainees were assigned for studies in the engineering and area and language curricula. In addition, about 75% of the student body of the medical school were inducted into army or navy and continued their medical studies as members of the armed forces. Wartime research under the Office of Scientific Research and Development was expanded during the year, and the Engineering Science Management War Training program was continued. The School of Medicine and the School of Hygiene and Public Health joined in offering a series of short refresher courses in medical and surgical specialties for commissioned personnel in the armed services. For statistics of enrolment, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (I. Bo.)

Johnston, Eric A. (1896–), U.S. industrialist, was born Dec. 21 in Washington, D.C. After working his way through the University of Washington, where he received the LL.B. degree in 1917, he served as a captain in the marine corps from 1917 to 1922. On receiving a medical discharge because of an injury suffered in China, he returned to Spokane. The next year he organized the Brown-Johnston company, an electrical manufacturing firm, and became its president. Ten years later he organized and became president of the Columbia Electric company. He also achieved controlling positions and directorates in several other firms in Spokane and Seattle. In 1931 Johnston was elected president of the Spokane Chamber of Commerce, and from 1934 to 1941 he was a director of the Chamber of Commerce of the U.S. He was elected president of this organization in April 1942 and was re-elected in 1943. In February and March 1943, in his role as chairman of the U.S. Commission of Inter-American Development, Johnston made a 20,000-mi. aeroplane trip through seven countries of South America, conferring with government leaders and businessmen on plans for postwar economic co-operation. He indicated that surplus war plants might be dismantled and sent to South America after the war. On his return to the U.S. he emphasized the importance of sending U.S. money and skill "down the broad avenues of exploration and not the blind alleys of exploitation." In August, at the invitation of Lord Halifax, he visited England, where he urged that postwar world trade be based to the maximum extent on free competitive enterprise. He is a member of the Economic Stabilization board; is on the Economic Advisory committee of the state department; is on the board of trustees of the Committee for Economic Development, and serves on numerous

committees in Washington as a representative of American business.

Jones, Jesse Holman (1874–), U.S. secretary of commerce, was born in Robertson county, Tenn., on April 5. At Dallas, Tex., in 1895 he became manager of a lumber company and seven years later organized his own firm. He engaged in extensive real estate operations and bought control of the Houston *Chronicle*, of which he is publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932 and he became chairman the following year. In July 1939 Jones was appointed administrator of the Federal Loan agency. On Sept. 13, 1940 President Roosevelt nominated him secretary of commerce. His position in the

END OF THE WALLACE-JONES FEUD In July 1943, cartooned by Seibel in the *Richmond Times-Dispatch* with the title "Right Out Where the Neighbors Can See"

defense program, which started in 1940, was a key one. His agencies provided the money for new plants, as well as for building up stockpiles of critical raw materials. Jones came under fire in 1942 when the Truman committee of the senate blamed him for much of the rubber shortage. On June 29, 1943, Vice-President Henry A. Wallace, chairman of the Board of Economic Warfare, attacked Jones violently for alleged failures to supply funds to acquire critical materials. Jones retaliated by charging Wallace with "malice, innuendo, half-truths and no truths at all." The president then eliminated the Board of Economic Warfare and rebuked both Wallace and Jones for their "acrimonious public debate."

Jones, Marvin (1886–), U.S. jurist and politician, was born near Valley View, in Cooke county, Tex., Feb. 26. He was graduated from Southwestern university, 1905, received his law degree from the University of Texas and was admitted to the Texas bar in 1907. He established a private practice of law in Amarillo, Tex., and in 1913 was appointed chairman of the board of legal examiners in the 7th supreme judicial district of Texas. He was elected to the house of representatives in 1917, where he served continuously for 24 years. While in congress, he was chairman of the house committee on agriculture for a number of years. On Nov. 20, 1940, he resigned from the house to accept an appointment as judge of the U.S. court of claims. Jones acted as principal adviser to director of economic stabilization James F. Byrnes on food problems, and was appointed head of the war food administration on June 28, 1943, when Chester C. Davis resigned from that post. Judge Jones had previously served as conference president and chairman of the U.S. delegation to the United Nations parley on food and agriculture at Hot Springs, Va.

Jordana y Souza, Francisco Gómez (1876–), Spanish army officer and politician, received his education at the Military academy and Staff college. He saw service in Cuba early in his career. In 1903, with the rank of captain, he was attached to the general staff. Later, he became an instructor at the Escuela Superior de Guerra. Promoted to the rank of brigadier general in 1920, he was placed in charge of Moroccan affairs in the Primo de Rivera government. In 1928, with the rank of lieutenant general, he was appointed high commissioner of Morocco. Jordana supported the rebel uprising against the Spanish republican government and subsequently held a number of important posts in the Franco dictatorship. Vice-president and minister of foreign affairs in 1938, he became president of the council of state the following year. He held this post until Sept. 3, 1942, when he again became foreign minister, succeeding Gen. Francisco Franco's brother-in-law, Ramon Serrano y Suñer. In April 1943, Jordana launched an appeal for peace, declaring that the nations engaged in the struggle were too powerful for either side to achieve total victory. His statement, regarded as a peace feeler made at Germany's request, was abruptly dismissed by U.S. Secretary of State Hull with a reiteration that unconditional surrender of the axis was still the sole objective of the Allies.

Judaism: *see* JEWISH RELIGIOUS LIFE.
Jugoslavia: *see* YUGOSLAVIA.

Juin, Alphonse Pierre (1888?–), French army officer, was born in Bone, Algeria, the son of a policeman. He was educated at St. Cyr, French military academy. During World War I, he served as captain with Moroccan forces, and later became chief of staff to Marshal Lyautey. A divisional commander during the battle of France, June 1940, he was taken prisoner by the nazis and was released a year later. There were indications that Pierre Laval had arranged for Juin's release from the nazis in order to have him supplant Gen. Maxime Weygand. On Nov. 20, 1941, Weygand "retired" and Juin was named commander-in-chief of the French forces in North Africa. At the time of the Allied landings in North Africa in Nov. 1942, Darlan and Juin agreed to surrender Algiers after 16 hours of hostilities. Captured by the Allies, Juin carried on negotiations with them and concluded an armistice, acting under Adm. Jean Darlan's authority. After the latter's assassination, Gen. Giraud, who became high commissioner of North Africa, appointed Juin commander-in-chief of French forces in North

Africa, Dec. 29, 1942. Although he was unpopular with the de Gaullists, the French Committee of National Liberation approved Juin's nomination as commander-in-chief of Giraud's forces in June 1943. Juin led French armies in Tunisia, and was in command of French units on the Italian front, Dec. 1943.

Justo, Agustín P. (1876–1943), Argentine statesman, was born Feb. 26 in Concepción del Uruguay, province of Entre Rios, Argentina. After studying at military academies, he became professor of military science at the Officers' Training school, 1903. Later, he taught civil engineering at the University of Buenos Aires and mathematics at the San Martín Military college. He rose to rank of general and for a brief period after the revolution of 1930 served as army commander-in-chief. Gen. Justo held the portfolios of war, agriculture and public works and climaxed his political career with election to the presidency in Nov. 1931, on a conservative coalition ticket. During the early years of his presidency, he was faced with the political and economic reconstruction of his country, weakened by revolution and the world economic depression. His tenure of office, 1932–38, was marked by his inauguration of what was tantamount to a "police state," though his presidential acts were considered more moderate than those of his predecessor, President Uriburu. A vigorous opponent of President Castillo's neutrality stand during World War II, Justo urged his countrymen to declare war on the axis powers. After Brazil declared war on the axis, he accepted a commission as a general in the Brazilian army. His death in Buenos Aires on Jan. 10 removed Castillo's most formidable foe from the Argentine political arena.

Jute. The supply of jute for bagging in the United States continued to be fairly adequate in 1943 due to the application of vigorous control measures. Although 83% of the jute comes from the province of Bengal, India, through Calcutta, considerable supplies came through in 1943. All imports and distribution were under control of the War Production board. Stocks were sufficient at the end of the year to meet all of the most vital needs and retain a small stock pile. Efforts to extend the use of substitute fibres and to mix cotton and other fibres with jute were continued with some success. Paper and cotton bags were being used to a larger extent in many industries. The crop of jute in India was above the average and shipping improvements gave some prospect that imports might increase in 1944. Special efforts were continued to get larger supplies of abacá, sisal, henequen, etc., from Latin America. (J. C. Ms.)

Juvenile Delinquency: *see* CHILD WELFARE; CRIME.

Kaiser, Henry J. (1882–), U.S. construction expert, was born May 9 in Canajoharie, N.Y. After 16 years with road construction projects in Canada, California and Cuba, 1914–30, he entered the dam construction field and by 1933, became head of Six Companies, Inc.—the organization that built Boulder and Parker dams. Kaiser, who was famous for completing construction jobs ahead of schedule, entered shipbuilding in Jan. 1941. In 1942, he obtained control of four large shipyards on the west coast. He revolutionized shipbuilding by prefabricating ship sections. On Nov. 18, his yard in Vancouver, Wash., assembled and launched a 10,500-ton Liberty ship in 3 days, 23 hours and 40 minutes. The year brought troubles too. On Jan. 17, the Kaiser-built 16,500-ton tanker *"Schenectady"* broke in two and sank. Labour troubles, with inter-union disputes, disrupted the Portland, Ore., yards. Before these difficulties had been disposed of, Kaiser, seeking a new field to conquer in aeroplane building, became involved in Brewster Aeronautical corporation's difficulties. He was made chairman on March 16, and president on Oct. 7. Kaiser arranged to get out of the bomber business, and to concentrate on Corsair fighters, promising 150 a month by May 1944.

Kameroons: *see* BRITISH WEST AFRICA; FRENCH COLONIAL EMPIRE.

Kansas. A central state of the United States, admitted Jan. 29, 1861; popularly known as the "Sunflower state." Total area, 82,276 sq.mi., of which 82,113 sq.mi. are land; pop. (1940) 1,801,028, a decrease of 79,971 or 4.3% from 1930. Capital, Topeka (67,833). The two larger cities were Kansas City (121,458) and Wichita (114,966). Of the state's population in 1940, 753,941 were urban, or 41.9%; 96.3% were white, 3.7% Negro and other races, 2.9% foreign born. Wartime population changes were important. The state census as of March 1, 1943, gave a total population of 1,803,201, a gain of 58,752 over 1942. Wichita became the largest city with 184,115, a gain of 50,971 for the year. Kansas City became the second city with 125,520 and Topeka third, 73,764.

History.—The executive officers in 1943 were: Andrew F. Schoeppel, governor; J. C. Denious, lieutenant governor; Frank J. Ryan, secretary of state; George Robb, auditor; Walter E. Wilson, treasurer; A. B. Mitchell, attorney-general; George L. McClenny, superintendent of public instruction; Charles F. Hobbs, commissioner of insurance; William C. Austin, state printer.

The legislature of 1943 passed little important legislation of a more permanent character, but enacted a number of laws growing out of war requirements. A new version of the Republican river compact with Nebraska and Colorado was signed Dec. 31, 1942, and ratified by the Kansas legislature. The long-standing problem of taxing transient cattle from the southwest, fattening in the Bluestem pastures on summer grass, was given a new adjustment by offering reciprocity treatment and tax levies proportional to the time spent in the state.

Education.—Enrolment in the public elementary and secondary schools declined from 460,036 in 1930 to 365,970 in 1940 and the number of teachers from 19,141 to 18,944. The high school enrolment in 1940 was 111,953. In 1937 there were 83,001 pupils enrolled in one-teacher rural schools, reduced in 1939 to 69,335. During the school year 1941–42, 219 small school districts were closed and other opportunity was provided.

Communication.—Kansas had 9,349 mi. of primary and 9,862 mi. of rural highways in 1939. In that year there were 8,667 mi. of railroads and 342,277 telephones.

Banking and Finance.—As of June 30, 1941, there were 660 active banks, 180 of which were national, with total deposits of $463,000,000. Savings banks held $79,800,000 of deposits. The budget estimates recommended to the legislature of 1943 were $19,067,365 for the biennium 1943–45, slightly less than the preceding period. In 1940 the state debt was $18,156,000 and debts of local governments, $98,493,000.

Agriculture.—The 1943 production of Kansas crops was 18% less than 1942, but, with the exception of 1941 and 1942, was greater than any year since 1932. The acreage was 3.5% above 1942 and the largest since 1932. Subsoil moisture was good and the wheat crop matured in spite of rainfall shortage, but floods and drought injured later maturing crops.

Leading Agricultural Products of Kansas, 1943 and 1942

Crop	1943 (est.)	1942	Crop	1943 (est.)	1942
Wheat, bu.	150,657,000	206,775,000	Potatoes, bu.	2,047,000	2,300,000
Corn, bu.	71,610,000	90,060,000	Barley, bu.	1,342,000	1,287,000
Oats, bu.	45,766,000	46,232,000	Tame hay, tons	1,719,000	2,059,000

An unusual number of cattle and sheep were wintered on wheat pasture and other feeds in western Kansas during the winter of 1942–43. The spring cattle movement from the southwest into the Bluestem pastures was about 13% larger than the previous year—229,000 compared with 202,000 and a 10-year average of 190,000. The pastures were fully stocked, with the largest supply of local and wintered-over cattle in years.

Manufacturing and Mineral Production.—For military reasons reliable figures for 1943 on these items were not available.

Principal Mineral Products of Kansas, 1939 and 1938

Mineral	Value, 1939	Value, 1938
Petroleum	$63,100,000	$72,100,000
Natural gas	29,356,000	27,485,000
Zinc	7,172,984	7,010,304
Cement	5,614,112	4,949,018
Coal	5,400,000	5,263,000
Stone	4,550,000	4,958,723

(J. C. MN.)

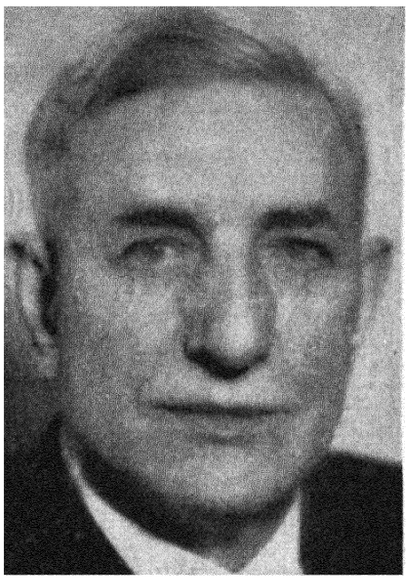
Keitel, Wilhelm (1882–), German army officer, born Sept. 22, was a commander of artillery during World War I. On April 1, 1934, he was promoted to major general and the following year, when Germany introduced conscription, he took charge of the personnel section (*Wehrmachtsamt*) in the war ministry, and was thus connected to a certain extent with the reoccupation of the Rhineland in 1936, and with the dispatch of German reinforcements to nationalist Spain. In Feb. 1938, during Hitler's "army purge" of Gen. von Blomberg and other conservative members of the high command, Gen. Keitel was appointed chief of the supreme command of the German armed forces. He thus directed operations against Poland, Norway, the Netherlands, Belgium, France and Britain in 1939 and 1940. On June 22, 1940, he signed the German-French armistice and on July 19 he was created field marshal by Adolf Hitler. Of the nazi high command triumvirate at the start of World War II—Brauchitsch, Halder, Keitel—only Keitel survived the 1941–42 purges. In 1943, as army chief of staff, he participated with Hitler in several important conferences with leaders of Italy, Rumania and other satellites.

Kelly, Howard Atwood (1858–1943), U.S. gynaecologist and radiologist, was born Feb. 20 in Camden, N.J. One of the original members of the faculty of Johns Hopkins Medical school, Dr. Kelly was a member of the school's "big four"; the others were Dr. William H. Welch, Sir William Osler and Dr. Henry T. Halstead. After his retirement in 1919, Dr. Kelly remained consulting gynaecologist at Johns Hopkins hospital. He was a pioneer in the use of radium treatment for cancer. His last published work was *Electrosurgery,* written in collaboration with Grant E. Ward (1932). He died in Baltimore, Jan. 12. (See *Encyclopædia Britannica.*)

Kenney, George Churchill (1889–), U.S. army officer, was born Aug. 6 in Yarmouth, Nova Scotia, the son of U.S. citizens. He attended the Massachusetts Institute of Technology for three years, but left in 1911 and later worked at civil engineering. In June 1917, he enlisted as a flying cadet in the U.S. signal corps reserve's aviation section and was commissioned as a first lieutenant in Nov. 1917. He saw active duty in France and was awarded the D.S.C. for extraordinary heroism in action. He was shot down twice. At the end of the war, he held the rank of captain. Kenney attended the Command and General Staff school, 1927, and the Army War college, 1933. In 1940, he irritated ranking U.S. military officials with the statement that the U.S. air force could be "thrown into the ash can" because it was too antiquated for the kind of war the Germans were planning. He was promoted to the rank of brigadier general, Jan. 1941, and became a major general, Feb. 1942. In command of the Fourth air force at San Francisco, he was later transferred, Sept. 1942, to the Southwest Pacific. There, under Gen. Douglas MacArthur, he was placed in command of Allied air forces. His fliers soon gained air supremacy over New Guinea and Kenney, co-operating with Gen. Sir Thomas Blamey's ground forces, sped supplies to Allied troops in the Buna area entirely by air. Kenney's ingenuity in devising new methods of aerial attack was recognized by the war department, which credited him with the origin of the accurate and deadly skip bombing technique. He was decorated by MacArthur for meritorious service in inventing a new fragmentation bomb dropped by parachute. Holding the rank of lieutenant general, Kenney headed a military commission to Washington from MacArthur in March 1943, presumably to request increased air aid. He returned to New Guinea the following month.

Kenny Treatment: *see* INFANTILE PARALYSIS.

Kent, Raymond Asa (1883–1943), U.S. college president, was born July 21 in Plymouth, Ia. He received his A.B. degree from Cornell college, Mount Vernon, Ia., and his A.M., 1910, and Ph.D., 1917, from Columbia university. He was professor of education at the University of Kansas, 1916–20, and dean of the College of Liberal Arts and professor of education at Northwestern university, 1923–29. He served as president of the University of Louisville, 1929–43. Dr. Kent was active on governmental educational boards and commissions and in 1942 was named by the navy to a board of curriculum policy consultants. He died while on a train en route from Washington, Feb. 26.



Kentucky. An east south central state of the United States, admitted June 1, 1792, popularly known as the "Blue Grass state." Area, 40,598 sq.mi., of which 489 sq.mi. constitute water. Pop. (1940) 2,845,627, of which 1,996,300 or 70.2% was rural and 849,327 or 29.8% urban. Negroes constituted 214,031 or 7.5%; and 15,631 were of foreign birth. Capital, Frankfort (11,492); largest city, Louisville (319,077). Other cities: Covington (62,018); Lexington (49,304); Owensboro (30,245); Paducah (33,765); Ashland (29,537). The U.S. census bureau estimated that war and war industries reduced the population in 1943 by 8.8% or 251,504.

History.—In the state election Nov. 2, 1943, Simeon S. Willis (R.) defeated J. Lyter Donaldson (D.) 279,144 votes to 270,525 for the governorship. The Republicans also elected Kenneth H. Tuggle, lieutenant governor; Eldon S. Dummit, attorney-general; Irvin Ross, auditor; Thomas W. Vinson, treasurer; John Fred Williams, state superintendent of public instruction; and Elliott Robertson, commissioner of agriculture. The Democrats elected the secretary of state, Charles K. O'Connell, with a plurality of 114 votes over his opponent. The general assembly remained Democratic in both branches—56 to 34 seats in the house, 22 to 15 in the senate. In a special congressional election Chester O. Carrier (R.) defeated J. Dan Talbot (D.) by 12,000 votes in the Fourth district Nov. 30, 1943. Two proposed amendments to the state constitution were rejected: No. 1 (to extend workmen's compensation) by 82,305 votes to 78,466; No. 2 (to raise the

constitutional limitation of salaries) by 121,997 votes to 44,765.

Education.—The elementary schools of the state in 1943 enrolled 561,844 pupils; and 697 high schools had 133,657 pupils. The total number of teachers in the public schools exceeded 19,000 in 1942.

Public Welfare, Charities, Correction.—Public assistance gradually consumed a larger amount of public funds. In 1939 recipients of state aid numbered 45,000; in 1943 the total was 54,000. These figures included the needy blind group. The correctional institutions in 1943 were the LaGrange reformatory; Eddyville penitentiary; and the reform school. County votes during the year increased the "dry" area of the state to 75 counties.

SIMEON S. WILLIS, Republican, elected governor of Kentucky Nov. 2, 1943 in a close contest

Communication.—The state in 1943 maintained directly nearly 10,000 mi. of highways of all types. There were 26 electric co-operatives serving 40,000 rural homes, chiefly in Tennessee Valley authority areas.

Banking and Finance.—The general budget for 1943–44 was $28,774,207. The budget did not include road and bridge projects separately maintained by fees and sales of fuel. Sources of the general fund in the fiscal year 1942–3 were: alcoholic beverage taxes $6,647,369; income taxes from corporations and individuals $9,225,000; property $6,984,970; excise taxes $6,871,409; licences of various sorts $1,862,424. The motor and road revenues exceeded $16,000,000. There were 302 state banks and trust companies in 1943 with total resources of $477,000,000.

Agriculture.—The leading agricultural crops for two years were as reported in the accompanying table.

Leading Agricultural Products of Kentucky, 1943 and 1942

Crop	1943 (est.)	1942
Wheat, bu.	3,902,000	5,194,000
Corn, bu.	75,350,000	82,200,000
Oats, bu.	1,760,000	1,760,000
Tobacco (all types), lb.	328,811,000	284,773,000
Tame Hay, tons	2,172,000	2,170,000
Irish Potatoes, bu.	4,664,000	4,560,000

Mineral Production.—In 1942 there were 63,463,700 tons of coal mined; the production of oil amounted to 4,250,000 bbl. Natural gas was not reported officially. There were 159 fatalities in the coal mines. (E. T.)

Kenya: *see* BRITISH EAST AFRICA.

Keppel, Frederick Paul (1875–1943), U.S. educator, was born July 2 on Staten Island, N.Y. After receiving his A.B. degree from Columbia university in 1898, he joined the faculty of that school, later becoming dean of Columbia college, 1910–18. He resigned to become an aide in the war department on a dollar-a-year basis. He subsequently became director of the American Red Cross foreign operations, 1919–20, executive secretary of the Russell Sage foundation and president of Carnegie corporation, 1923–41. In 1941, he was again called to serve the government as a member of the board of appeals on alien cases. He was also a director of Columbia Broadcasting system at the time of his death in New York city, Sept. 8.

Kesselring, Albert (1887–), German army officer, began his career as an aviator in World War I. His friendship with Reichsmarshal Hermann Goering aided his rise in German military circles, and in 1936, he was appointed first chief of the luftwaffe's general staff but later resigned because his technique of air operations met with disapproval. The shakeup in the German high command in Feb. 1939 brought Kesselring back to favour and he directed air operations between Danzig and Brest-Litovsk during the Polish campaign in Sept. 1939. As commander of Air Fleet II, he guided the air attack upon the Netherlands, Belgium and France in May 1940. Kesselring was then promoted by Hitler to the rank of general field marshal. He participated in the battle of Britain, commanded a German aviation unit on the Russian front, 1941–42, and served as chief of the luftwaffe in Italy, Feb. 1942. In the winter of 1942–43, when the axis forces in North Africa were being hard pressed, Kesselring attempted unsuccessfully to transport troops to Marshal Erwin Rommel. The latter complained that he was not receiving proper air support, and on Dec. 29, 1942, a London dispatch announced that Kesselring had been shifted from the Mediterranean to the Don front in Russia. In early 1943, he returned to the Mediterranean and in Sept. 1943, he was placed in command of the central Italian front. Rommel was reported to have clashed with Kesselring again in Oct. 1943, and was said to have assumed command of the axis forces in Italy, with Kesselring once more being shuttled back to the Russian front.

Kidnapping. Most notable feature of kidnappings in 1943 was their virtual disappearance in connection with gang warfare. The gradual subsidence of the gangs themselves apparently removed the occasion for the use of kidnapping as a side-line of their operations. As in previous years, kidnappings were most frequent in the United States, though the far east, long a centre for such crimes, and western Europe, both reported isolated cases.

World War II provided the setting for three kidnapping episodes. In May, the daughter of A. Seyss-Inquart was reported held as a hostage by Netherlands patriots, and in October there was a Japanese attempt to kidnap the British consul at Macao. In June, the Reverend W. A. Green was kidnapped and robbed at Atlantic City, N.J. Five U.S. soldiers were arrested and indicted for the crime.

There was little kidnapping for the purpose of extorting ransom, but several instances in connection with major burglaries. In April, the manager of a night club in New York was taken from his home, forced to open a safe, and then was left bound; the kidnappers escaped. In August, bandits took K. M. Rowe, president of the Arkansas Valley State bank from his home and forced him to open the bank vault; the perpetrators were apprehended. The following month, W. P. Forshee, branch manager of the Royal Bank of Canada at Wheatley, Ontario, was forced to leave his home and to open the bank vault. The six bandits fled after looting the bank.

Fugitives from institutions also employed kidnapping as an aid to their escape. Three convicts escaping from the Mississippi State penitentiary kidnapped a woman and later released her at Memphis, Tenn. Similarly, E. Caster, fleeing from the Penn-

sylvania Hospital for the Criminal Insane, abducted C. M. Murray at Fairview, Ohio.

Most striking of the kidnappings motivated by robbery, was that of J. Muldoon, who was taken and later drugged, in connection with a liquor truck holdup. Three men suspected of the crime were arrested by New York city police.

Infant kidnappings were relatively frequent, as in previous years. Two similar cases were those of the Serdinia and Zabinsky babies, who were kidnapped, and later abandoned and recovered, in New York city. On July 4, James DiMaggio, three years old, was reported missing. He was later found by New York city police. Mrs. M. P. Tilove admitted the abduction and was committed to Bellevue hospital for psychological examination. On Aug. 28, she was declared sane and was indicted by a federal grand jury ("Lindbergh law"). Upon admission to bail, Mrs. Tilove cited worry and despair occasioned by divorce proceedings as the reason for her act. At her trial on Oct. 27, her former husband testified that she had tried to convince him that the DiMaggio baby was his own child.

Despite the burdens imposed by war activities, the Federal Bureau of Investigation (U.S.) continued to be the world's outstanding police agency in kidnapping cases. From June 1932, when it was granted an effective jurisdiction in kidnappings, the FBI had solved 99% of the cases it investigated.

During 1943 a Mexican decree placed kidnapping in the category of capital offenses. (*See* also FEDERAL BUREAU OF INVESTIGATION.) (BR. S.)

King, Ernest Joseph (1878–), U.S. naval officer, was born Nov. 23 in Lorain, O. He left Annapolis to serve in the Spanish-American War, returning to the naval academy to graduate in 1901. During World War I he was assistant to the chief of staff of the commander in chief of the U.S. fleet. In 1933 he was promoted to rear admiral and he was vice-admiral in command of the fleet's aircraft battle force, 1938–39.

On Feb. 1, 1941, Adm. King was made commander of the Atlantic fleet and on Dec. 20, 1941, 13 days after the Japanese attack on U.S. possessions in the Pacific, he was designated commander in chief of the U.S. fleet, in what was apparently a shake-up in navy organization as well as personnel. On March 9, 1942, he took over the post of Adm. Harold R. Stark, chief of naval operations, in addition to the office of commander in chief of the U.S. fleet.

Throughout 1943 U.S. naval strategy was closely linked with that of Great Britain, and Adm. King took part in several military and naval conferences. In September he appeared before the Senate-House Military Affairs committee to urge the drafting of fathers rather than a lowering of physical standards for army and navy.

King, William Lyon Mackenzie (1874–), Canadian politician, was born at Berlin (now Kitchener), Ont., Dec. 17. His grandfather, William Lyon Mackenzie, had been prominent in the struggle for political freedom in 1837. King entered parliament in 1908, became leader of the Federal Liberal party in 1919, and was returned to office as prime minister for the third time on Oct. 23, 1935. Shortly after Canada entered World War II, King's foes charged him with negligence and incompetence in handling the war effort. But the country did not support this view, and in March 1940 his party won a landslide election, adding 25 seats to its parliamentary majority. In Aug. 1940, when a nazi invasion of Britain appeared imminent, the Canadian prime minister and President Roosevelt agreed to set up a permanent joint board of defense to study common defense problems. The fruit of another parley with President Roosevelt on April 20, 1941, was a U.S.-Canada pact for co-operation in producing war materials for Britain.

In April 1942 King asked for a plebiscite giving authority to send conscripted soldiers overseas and won an overwhelming majority. During 1942 and 1943 he attended sessions of the Pacific war council and several Churchill-Roosevelt conferences in Washington and Quebec. On April 23, 1943, he indicated that air concessions over Canada would end with the war, saying that Canada intended "to press vigorously for a place in international air-transportation."

In June 1943 Columbia university conferred upon King an honorary degree of doctor of laws.

Kingman Island: *see* PACIFIC ISLANDS, U.S.

Kinnick, Nile Clarke, Jr. (1919?–1943), U.S. football star, was all-American halfback of 1939 at the University of Iowa and 1939 "athlete of the year." Besides his outstanding record in sports, he was a brilliant student and had been elected to Phi Beta Kappa. After his graduation, he returned to Iowa to study law but left school to enlist in the naval air corps in Sept. 1941. He received his naval training at Corpus Christi, Tex., and Pensacola, Fla., and was later commissioned as ensign. Assigned to an aircraft carrier, he was reported lost by the navy department on June 2 when his plane made a forced landing at sea.

Kisch, Frederick Hermann (1888–1943), British army officer, was born in August in Darjeeling, India. He attended the Royal Military academy at Woolwich and joined the Royal Engineer corps in 1909. He saw service in France and Mesopotamia during World War I and was decorated for bravery. In 1919, he was sent as delegate to the Versailles peace conference. Kisch retired from the army in 1922 and went to Palestine as a member of the Zionist Executive in Jerusalem, an organization which acted as a link between the British authorities and the Jewish population. He rejoined the Royal Engineers in 1939 and was named chief engineer of the British 8th army. Brigadier Kisch was credited with construction of the fortifications at El Alamein and with laying the engineering plans that made possible General Montgomery's swift advance through Libya. He was killed near Sousse, Tunisia, April 11.

Kiska: *see* ALASKA; WORLD WAR II.

Kiwanis International. Kiwanis International is composed of all Kiwanis clubs in the United States and Canada. Membership in each club is limited to two men from each business, professional and agricultural classification. The first Kiwanis club was organized in Detroit, Mich., Jan. 1915. In Canada the first club was organized in Hamilton, Ont., Nov. 1916. In Dec. 1943, there were 121,670 members in the 2,197 Kiwanis clubs. The name "Kiwanis" suggests the unselfish and constructive service of Kiwanians; the motto of the organization is "We Build." In Dec. 1941 war work was added to the continuing programs of youth service, community welfare and rural-urban relations.

The general office in 1943 was at 520 N. Michigan ave., Chicago, Ill.

President (1943–44) was Donald B. Rice, Oakland, Calif. Secretary, O. E. Peterson, Chicago, Ill.

(W. A. D.)

Kleist, Paul Ludwig von (1881–), German army officer, was born Aug. 8 in Braunfels, Prussia. Product of a German military school, he served as a lieutenant of hussars and regimental commander in World War I. After the armistice, he was a cavalry instructor in Hanover, but during Hitler's rule he was lifted from the obscurity of the classroom to command of an army corps. Kleist participated in successful operations in Poland, 1939, France, 1940, and led the mechanized column that took Belgrade in the Yugoslav campaign, 1941. Early in the Russian campaign, his tank army led the nazi attack on Kiev and the advance through the Ukraine. Kleist's armies also captured Dnepropetrovsk in Aug. 1941, but this proved a pyrrhic victory, since the Russians had destroyed the famous dam there before retiring. In Nov. 1941 Kleist's armies captured Rostov, only to lose it a week later when General Timoshenko launched a counteroffensive. When the nazis renewed their offensive in the summer of 1942, Kleist's 1st German tank army drove through to the foothills of the Caucasus. In 1943, when the Russians were pushing the Germans back, Kleist's name faded from the dispatches.

Knight, Eric (1897–1943), British author, was born April 10 in Menston, Yorkshire. At the age of 12 he was working half-time in the Yorkshire mills as a bobbin-setter and went to school the remainder of the time. Sensitive about his cultured accent, he quickly picked up the colourful dialect and flavourful speech of his new environment—Skircoat Green—which was to figure as the "Powkithorpe Brig" setting in his Sam Small stories. Before he went to America, he had already worked in textile mills and steelworks. In the United States, he worked as copy boy on a Philadelphia newspaper, studied art at the Boston Museum of Fine Arts and the New York Academy of Design and knocked about the country as reporter on various newspapers. Chiefly noted for his best-selling novel, *This Above All* (1941), written after a visit to England during the nazi air blitz, he already had to his credit *Song on Your Bugles* (1937) and a whimsical Yorkshire story, *The Flying Yorkshireman* (1938). The latter work met with such success that he wrote a sequel, *Sam Small Flies Again* (1942). He was a member of the Canadian "Princess Pat" Light Infantry regiment in World War I and received a commission as major in the U.S. army special services section in July 1942. He was killed in the crash of a transport plane in the jungle near the coast of Surinam Jan. 15, while on a foreign mission.

Knights of Columbus. Organized in 1882, this fraternal order of men is dedicated to the preservation and championship of Catholic and traditional American principles. There were tens of thousands of Knights of Columbus in the armies of their respective countries.

The total membership as of Aug. 1943 was 437,924, an increase of more than 9,000 over the previous year. The associate members numbered 221,943; insurance members 215,981. There were 2,495 local councils in 48 states, U.S. territories and possessions, Canada and Latin America. Total assets were reported as $53,492,032.24, total liabilities $48,122,214.35, leaving a surplus of $5,369,817.89. Total income was stated as $8,011,268.85, and benefits paid by insurance claims and old age benefits paid out were $4,270,142.44.

The 61st supreme convention was held Aug. 17–19 at Cleveland, Ohio; 279 delegates from 270 state and regional jurisdictions attended. The report showed a vast increase in membership of 9,101 over the previous year. Officers re-elected for another term were: supreme knight, Francis P. Matthews; deputy supreme knight, John E. Swift; supreme secretary, Joseph F. Lamb; supreme advocate, Luke E. Hart; supreme chaplain, Rt. Rev. Leo M. Finn.

The order in 1943 engaged deeply in war activities. War bonds were sold to the value of $89,266,307 or 360% of the assigned quota, and the order invested in excess of $20,000,000 in war bonds of U.S. and Canada. Knights of Columbus Catholic army huts were operated in U.S., Great Britain, Canada, Newfoundland, Iceland, North Africa, Sicily, Italy. A chapel with a resident chaplain was established in London. Four hotels were provided for Canadian servicemen on leave in London, and a new hostel was provided in place of that destroyed by fire at St. John's, Newfoundland, in Dec. 1942.

At the supreme convention a resolution was adopted pledging the homage of the order to the martyred Polish nation. A second resolution requested the president of the United States to entrust administration of Italian affairs to persons sympathetic to the culture and religion of Italy. A third resolution placed the order on record as opposed to anti-Catholic representation in the press and motion pictures.

Youth guidance was carried on for the 20th successive year by trained workers. The Columbian Squires, lads too young for membership, were active through their councils in the gathering of scrap and selling war stamps. Fifteen additional circles, including two in Mexico, were organized, bringing up the membership of the Columbian Squires to 15,380, and each circle developed its own civilian defense program. In 1943 the order provided 18 scholarships at the Catholic University of America. The correspondence school for members and their families completed its 20th year of service.

National headquarters in 1943 were at New Haven, Conn. *Columbia*, a monthly illustrated magazine, and *News*, a weekly, are the official publications. (J. LAF.)

Knox, (William) Franklin (1874–), U.S. publisher, statesman and soldier, was born Jan. 1 at Boston and was educated at Alma (Mich.) college. He joined Theodore Roosevelt's Rough Riders, with whom he served from April to Sept. 1898. He was in France from May 1918 to Feb. 1919 and became colonel in the 365th field artillery. His newspaper career began on the Grand Rapids, Mich., *Herald* shortly after the Spanish-American war. He was successively publisher of the Sault Ste. Marie, Mich., *News*, 1901–12; controlling owner of the Manchester, N.H., *Union and Leader;* general manager of the Hearst newspapers; and, from 1931, publisher of the *Chicago Daily News*. Knox was Republican candidate for vice-president in 1936. Roosevelt named him secretary of the navy, June 20, 1940, when war was threatening. He flew to Pearl Harbor immediately after the Jap attack and reported to the nation on the damage done there. At the end of 1942 Knox stated that the U.S. navy was larger and more powerful than it was the day before Pearl Harbor. Eleven months later, when the 27,000-ton carrier "Wasp" was delivered on Nov. 24, 1943, Knox announced that the warship strength of 838 vessels was exactly double what it had been at the beginning of the year, the "Wasp" being the 419th ship delivered during 1943. On Dec. 14 he stated that "preliminaries" in the Pacific were over and that major blows against Japan were being prepared.

Knudsen, William Signius (1879–), U.S. industrialist, was born in Copenhagen, Denmark, on March 25 and as a youth worked in a bicycle shop in his native town. At the age of 20 he emigrated to the United States, where he found work in a shipyard in New York. After working in a railroad shop, he went to Buffalo, where he ultimately became superintendent of a mill. He then worked for

Ford Motor company and became associated with Chevrolet Motor company, of which he was made vice-president in 1922 and later president. From 1933 to 1937 he was executive vice-president of General Motors corporation, and in the latter year he became president. On May 28, 1940 President Roosevelt appointed him commissioner of industrial production for the national defense advisory commission.

When President Roosevelt created the Office of Production Management Jan. 7, 1941, he named Knudsen director general. Knudsen continued to be the "top man" in the production phase of national defense until Jan. 1942, but gradually matters of general policy were delegated to other agencies such as the Office of Price Administration and the War Production board. On Jan. 16, 1942, he was appointed production director of the war department and made a lieutenant general. During the following two years he spent much of his time in the field, visiting and counselling industries, and otherwise expediting production. In Aug. and Sept. 1943, he visited Hawaii, Australia, New Zealand and other Pacific points.

Koga, Mineichi (1885–), Japanese naval officer, was born in September in Saga-ken. He was graduated from the Naval Staff college, 1906, and rose to prominence in the Japanese navy. He was an attaché at the Japanese embassy in Paris, 1926–27, and on his return home was given the captaincy of a warship. After holding a post as commander of a training squadron, he was made vice chief of staff of the Naval Staff board, 1937, and just before the attack on Pearl Harbor, he was head of the Japanese fleet in China waters. At the outbreak of war in Dec. 1942, Adm. Koga's naval units supported the Hongkong and Malaya operations, and in 1943 he was commander of the important Yokusoka naval station. After the death of Adm. Isoroku Yamamoto in the spring of 1943, Adm. Koga was made commander in chief of the Japanese fleet.

Korea: *see* CHOSEN.

Krueger, Walter (1881–), U.S. army officer, was born in Flatow, Germany, Jan. 26. Brought to the U.S. as a child, he attended the Cincinnati Technical school from 1896 to 1898 and left school to enlist as a private at the outbreak of the Spanish-American war. He later saw action during the Philippine insurrection, on the Mexican border, and during World War I. From 1921 to 1938 he filled various posts at army schools and on the general staff. Promoted through the grades, he became a brigadier general in 1936, major general in 1939, and lieutenant general in 1941. In May 1941, Gen. Krueger assumed command of the 3rd army, which later in the year defeated Gen. Ben Lear's 2nd army in practice manoeuvres in Louisiana. When the 6th army in the Southwest Pacific was organized early in 1943, he was sent to Australia to take command. In December the 6th army, under Gen. Krueger's command, invaded the island of New Britain.

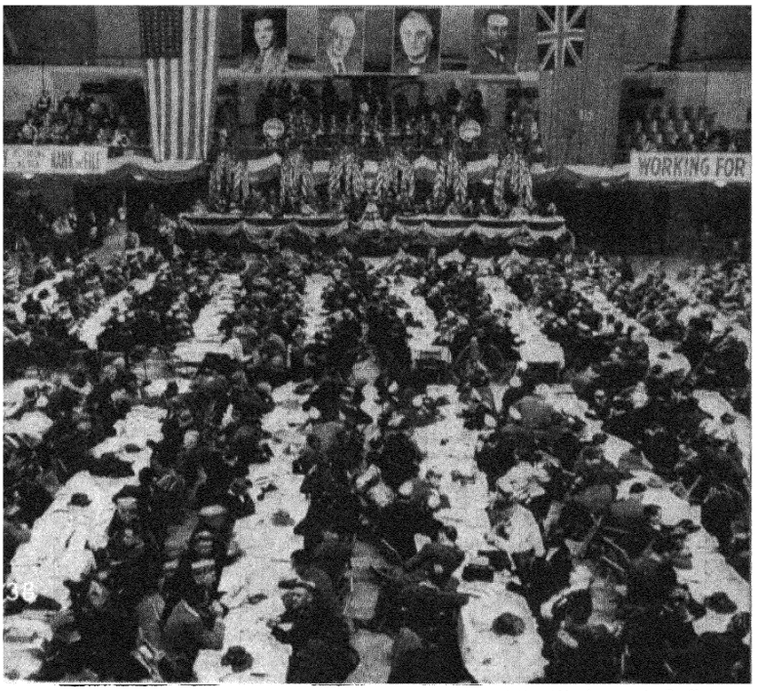
Labour Party. The British Labour party continued in 1943 to work under the conditions of political truce imposed by the war, and to be represented in the war cabinet and the government. Cabinet changes caused Clement Attlee to retire from the dominions office and replace Sir John Anderson as chairman of the cabinet committee on home affairs, while remaining deputy prime minister. Arthur Greenwood continued to lead the party in the house of commons, and George Ridley became chairman of the party executive.

The affiliated membership of the Labour party showed a small further fall in 1942, due mainly to the calling-up of members and the dislocation of some of the local labour parties by war conditions. The total was 2,453,000 as against 2,485,000 in 1941 and 2,663,000 in 1939. The decline was mainly in the individual membership of local parties, which had fallen from 409,000 in 1939 to 219,000 at the end of 1942. The rise in trade union membership was not reflected in the Labour party totals, as most of the new members had not yet become subscribers to the political funds of their trade unions. The development of the Labour party's membership was hampered by the party's failure to give a clear lead. A considerable floating section of left-wing opinion, especially among young people, was attracted away to Common Wealth, which, with a program very similar to the Labour party's, was unhampered by the truce and had been free to contest by-elections. The main body of the party was, however, fully determined to maintain the truce, in order not to put its members in the government into a difficulty, and not to lay itself open to any suspicion that it is not whole-hearted in its support of the war. The party conference in 1943 therefore decided to ban Common Wealth by making membership of that body inconsistent with membership of the Labour party; but this decision would be very difficult to enforce. The Labour party conference also rejected, by 1,951,000 votes to 712,000, a renewed proposal to accept the Communist party into affiliation. The conference approved a number of resolutions dealing with various aspects of reconstruction policy, elaborating the general conclusions of the reconstruction report approved in 1942. The most acrimonious discussion arose over a resolution and amendment dealing with the treatment of Germany after the war. The main object of the amendment was to draw a sharp distinction between the nazis and the German people and to demand that the whole people of Germany should not be treated as criminals on account of the nazis' misdeeds. But errors in tactics led to the defeat of the amendment. This attitude was reversed when the same issue came before the Trades Union congress in September, and it seems clear that this later decision more correctly expressed the real state of Labour opinion.

During the year, the Labour party in parliament showed increasing activity in criticizing the government, especially for its failure to formulate decisions on postwar policy. Both the parliamentary party and the conference gave strong support to the Beveridge social security proposals, and also pressed for a favourable government decision on the Uthwatt, Barlow and other reports dealing with basic problems of reconstruction. Colonial

questions also occupied an increasing amount of Labour attention. (*See* also CABINET MEMBERS.) (G. D. H. C.)



Labour Unions. **United States.**—The status and reputation of unions were deeply affected by a considerable increase in strikes during 1943. After a relatively quiet year, when less than 1,000,000 employees were involved in strikes, the number of strikes in 1943 rose to more than 3,500, the numbers on strike to nearly 3,500,000, and man-days lost through strikes to 14,000,000. The largest and most important of the strikes were called in vital war industries—coal, rubber and steel.

The primary cause of this outbreak of labour disturbances was a revolt against the principles of wage control devised and administered by the National War Labor board and other federal agencies. The kernel of the board's wage policy was the limitation of wage increases to 15% above the level of wages prevailing in Jan. 1941. The aim of this policy was to maintain the purchasing power of wages at their Jan. 1941 level and its underlying assumption was that the government's machinery of price control would keep the rise in the cost of living from exceeding 15%. Successful as price regulation, compared with the experience during World War I, was, the official index of living costs actually increased nearly 25% and unofficial figures collected by the unions showed a substantially greater advance. Throughout the year, therefore, organized labour became increasingly critical of the government's wage formula and from time to time strikes broke out to force a change in public policy.

It fell to the lot of John L. Lewis, however, to bring this whole question to a climax. In common with other labour leaders Lewis was being subjected to mounting pressure for higher wages by his union's members. Early in the year the anthracite miners struck against an increase in union dues and to get them back to work Lewis promised a substantial advance in wages. With the approaching termination on April 1 of the union's agreement with the coal industry, the United Mine Workers demanded a wage increase of $2 a day. Although this demand included pay for travel time (portal to portal), granting it would clearly have violated the official wage policy. Consequently, the miners' representatives refused to appear before the War Labor board and submit their case to it. When the coal operators turned down the union demands, strikes spread through the mines. Intervention by the president proved futile. Finally the government took over the mines and the men returned to work. But the wage dispute remained unsettled. On four occasions the mines were shut down. Prolonged negotiations were held between the union and the fuel administrator and the union and the operators. On Nov. 5, the War Labor board approved a wage increase amounting to $1.75 a day.

This settlement, regarded by the whole of organized labour as a surrender to John L. Lewis, brought on a nation-wide movement for the abandonment of the official ("Little Steel") wage formula. The steel, automobile and textile unions asked for increases running from 10 to 20 cents an hour. The conservative railroad unions brought a long-pending and complex wage dispute to a head by taking a strike vote and setting the date for a strike. Only intervention by the president and turning the roads over to the army averted a stoppage of rail transport. At the end of December the organized steel workers, launching their campaign for higher wages, struck important steel producers and threatened to tie up the whole industry.

Even before the strikes of 1943, the public had shown signs of fearing the growing power of organized labour and congress had on several occasions attempted to adopt regulatory legislation. But these efforts were blocked by the president. The new wave of strikes and their threat to war production impelled congress to action. On June 12 the Smith-Connally (Anti-Strike) bill was passed and several weeks later both houses of congress overrode the president's veto by large majorities. This act, aimed primarily to prevent strikes in war industries, set forth the conditions under which strikes might be called, the authority of the government to operate struck plants, and the powers of the War Labor board. In addition, the act forbade labour organizations, as well as corporations, to make political contributions in connection with elections to federal office.

THE ANNUAL CONVENTION of the United Automobile Workers at Buffalo Oct. 4–10, 1943, voted support for Pres. Roosevelt in 1944 if he took an active stand against opponents of the New Deal. The two centre photographs above the rostrum are of C.I.O. President Philip Murray and President Roosevelt; at the left, Sec'y-Treasurer George Addes of the U.A.W.; at the right, the U.A.W.'s president, R. J. Thomas

How far public opinion had swung against organized labour was suggested by the results of the congressional and local elections held in November. Both the A.F. of L. and the C.I.O. had made careful preparations for the fall elections, had declared themselves against anyone who had supported the Smith-Connally bill, and had made strong efforts to get out the labour vote. The result was a considerable Republican victory in all parts of the country, the greatest upset being the election of a Republican governor in the normally Democratic state of Kentucky.

Inside the labour movement the two major factions, the A.F. of L. and the C.I.O., drifted farther apart. Peace negotiations, under way the year before, were abandoned. A dispute between the metal trades' unions of the A.F. of L. and the shipbuilders' union of the C.I.O. over the unionization of the employees of the Kaiser shipyards not only resulted in an overwhelming victory for the federation but also caused congressional action denying the right of the National Labor Relations board to nullify existing labour contracts. These defeats of the C.I.O. aggravated the already strained relations between it and the A.F. of L. Fuel was added to the fire when an application for membership in the federation by the United Mine Workers was warmly received. Although the resolution of difficult jurisdictional issues delayed action on the miners' application, it was generally believed that they would shortly be reaffiliated with the A.F. of L.

Owing again to the favourable economic conditions of war and the friendly policies of the administration, the membership of all branches of organized labour continued to increase, but at a slower rate than in the earlier war years. At the end of 1943, total membership probably exceeded 12,000,000 by a small amount and

embraced approximately one-third of the country's wage-earners and lower salaried employees. (*See* also AMERICAN FEDERATION OF LABOR; BUSINESS REVIEW; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LAW; NATIONAL LABOR RELATIONS BOARD; STRIKES AND LOCK-OUTS.) (L. Wo.)

Great Britain.—By the end of 1942 the trade unions affiliated to the British Trades Union congress had increased their membership to 6,024,411, as compared with 5,432,644 the previous year and 4,866,711 in 1939. The increase was specially marked among the unions in the metal and engineering trades and among those catering for general workers, which in practice enrol a high proportion of the less skilled workers in the engineering and other armament industries. There were four unions with a membership of over 500,000—Transport and General Workers (806,000), General and Municipal Workers (721,000), Amalgamated Engineering union (645,000), Mineworkers' federation (599,000). Two other unions—the National Union of Railwaymen and the Distributive Workers—exceeded 250,000, and four others 100,000. Of the total affiliated membership, 1,220,000 were women.

The Trades Union congress includes most of the important unions. The civil servants, including the post office workers, were still excluded from affiliation by the 1927 Trade Unions act. There was a renewed attempt in 1943 to get the ban on the affiliation of the civil service unions removed. The largest of these, the Union of Post Office Workers, applied for affiliation; and the T.U.C. general council agreed to recommend the congress to accept it in defiance of the law. The government thereupon threatened disciplinary action against all employees who remained in membership of the U.P.W.; and after negotiations with the Labour members of the government and with the Labour party it was decided to postpone acceptance of the U.P.W. affiliation and to make a further effort to secure an agreed modification of the law.

The T.U.C. and its affiliated bodies continued to give full support to the war effort, and to be represented on numerous committees set up by the government in connection with the various departments. In particular, there was a rapid growth during the year of factory joint production committees, and the trade unions established regional machinery and a special advisory service for the co-ordination of their efforts. There were at this time joint production committees in most of the large factories engaged on war work.

Interest at the Trades Union congress of Sept. 1943 was centred largely on discussions with the trade unions in the United States and the soviet union. There was great disappointment over the refusal of the American Federation of Labor either to enter into a joint committee with the T.U.C. and the Soviet All-Union Council of Trade Unions, or to widen the membership of the Anglo-American Trade Union committee so as to include the Congress of Industrial Organizations and the Railroad brotherhoods. The T.U.C. general council had made it clear to the American Federation of Labor that it was strongly in favour of both these things, but had been unable to influence the American Federation of Labor to modify its attitude. The T.U.C., in face of this report, reluctantly consented to the continuance of the Anglo-American committee on its existing basis. Discussions took place between the British and soviet trade union delegates in both London and Moscow. The soviet delegates brought forward a proposal to widen the Anglo-Soviet committee by the inclusion of delegates from other European countries as well as from the United States; but the T.U.C. regarded such a move as premature and as needing special consideration in the light of the position and prospects of the International Federation of Trade Unions, to which the T.U.C. belonged. The soviet delegates also strongly pressed the British trade unions to declare emphatically in favour of an immediate large-scale second front in Europe; but the British delegates took the view, which was endorsed at the congress in September, that they could not take the responsibility of pronouncing on the correct timing of a military operation about which only the military authorities and the government could have the requisite knowledge. Accordingly, the T.U.C. would not go beyond declaring in favour of the second front at the earliest practicable date.

During the autumn months of 1943 there were a number of strikes, chiefly among miners and munition workers, which received a great deal of publicity in the press. Actually, these strikes were all small and local, and the time lost by strike action continued to be low—substantially lower than in World War I. Attempts were made to represent these strikes as due to the activities of political agitators; but there was no real evidence for this view, and the communists especially had been strongly against strike action and everywhere advised the strikers to return to work. The main cause was undoubtedly sheer weariness, aggravated by the unwise attempts of the government to discourage holiday-making during the summer. Discontent at the government's failure to make up its mind about the vital issues of reconstruction might have been a small contributory cause, but did not seem to have played a major part. In the coal mines there were special sources of unrest, arising out of the failure of the reorganization plans of the ministry of fuel and power to achieve any considerable results and out of wage-troubles, especially among the younger men.

A notable feature of the year's Trades Union congress was the rejection of a "Vansittartite" resolution and the acceptance of an amendment drawing a sharp distinction, in respect of "war guilt," between the nazis and the German people. This decision reversed that reached earlier in the year at the annual conference of the Labour party (*see* LABOUR PARTY) and undoubtedly represented better the majority view in British labour and trade union circles.

The Trades Union congress was making, through a number of committees, its own study of reconstruction problems. It had cordially endorsed most of the proposals made in the Beveridge report on the social services. It maintained its general ban on association with the Communist party; but the congress of 1943 agreed to modify it by lifting the ban on local trades councils which admitted Communist delegates. (G. D. H. C.)

Lacrosse. Despite the fact that the scope of its program during 1943 was cut down by the shortage of undergraduate manpower, the United States Intercollegiate Lacrosse association voted to carry on a full season in 1944, including the annual north-south game, provided the latter proved feasible when the 1944 season reached its climax. It was the north-south game which proved the highlight of the 1943 campaign with the Southern Collegiate All-Stars defeating the north 9–5. The north squad was made up of players from Army, Princeton, Yale, Rutgers, Pennsylvania, Stevens Tech, Lehigh, City College of New York, Drexel, Cornell, Syracuse and Springfield. The Southern All-Stars were a composite of navy, Maryland and Johns Hopkins.

The two best teams in the country were Navy and Maryland. On the distaff side, Philadelphia clinched its tenth National Women's Lacrosse association tournament title by defeating the Etceteras 12–2. The latter squad was made up of college girls.

A committee of the U.S. Intercollegiate Lacrosse association discussed with army and navy officials the use of Lacrosse as a part of training camp programs, believing that it was second only to football as a conditioner. Up to the end of 1943 this had not been adopted officially by the services. (T. J. D.)

La Fontaine, Henri (1854–1943), Belgian lawyer and politician, was born April 22 in Brussels. A senator from 1894 to 1936, and vice-president of the senate, La Fontaine also was a professor of international law at the University of Brussels and the City College of New York. He was awarded the Nobel peace prize in 1913. La Fontaine presided over 20 world peace congresses and drew up a "magnissima charta" calling for a "United States of the World." He was named head of the International Bureau of Peace in Brussels, 1907, was president of the Juridical committee of the Inter-Parliamentary union, and represented his country at the League of Nations in 1920 and 1921. A Berne dispatch of May 26 carried a report of his death.

Land, Emory S. (1879–) U.S. naval officer and government official, was born Jan. 9 in Canon City, Colo. He was graduated from the University of Wyoming, 1898; Annapolis, 1902; and the Massachusetts Institute of Technology, 1907. During World War I, he served on the staff of Adm. William Sims in London. Associated with problems of naval construction after 1904, he was assistant chief of the navy's bureau of aeronautics, 1926–28; chief of the bureau of construction and repair, 1932–37. Made a rear admiral when he retired from the navy in 1937, he was named commissioner of the U.S. maritime commission in 1937, and succeeded Joseph Kennedy as chairman in 1938. Under his administration during the next five years a tremendous program of shipbuilding developed. On Sept. 24, 1943, he stated that the program begun in 1938 would total 50,000,000 dead-weight tons by the end of 1944. There were then 100 yards, employing 750,000. On Jan. 3, 1944, he announced that 1,896 ships, with a dead-weight tonnage of 19,238,626, had been built in 1943. Soon after the U.S. entered World War II, Adm. Land was also made administrator of the War Shipping administration. On Aug. 11, 1943, his maritime commission named a committee to plan a postwar shipping program.

Landsteiner, Karl (1868–1943), U.S. medical research scientist, was born June 14 in Vienna, Austria. He received his M.D. at the University of Vienna, 1891. At the invitation of the Rockefeller Institute for Medical Research in 1921, he went to the United States, where he became a naturalized citizen. In 1930, he received the Nobel prize for medicine for his discovery of the human blood groups, a work which made possible the successful use of blood transfusion. His discovery of the four blood groups and his subsequent research showed that by matching the patient's blood group with that of the donor, many of the dangers of blood transfusion could be eliminated. Dr. Landsteiner, who was a member of the Rockefeller institute from 1922 until his retirement in 1939, extended his research to immunology, bacteriology, virus diseases and drug allergy. He wrote extensively on these subjects and was honoured by many of the leading scientific organizations over the world. He continued his medical research at the institute after his retirement and died while working in his laboratory in New York city, June 26.

Laos: *see* FRENCH COLONIAL EMPIRE.

Laparra, Raoul (1876–1943), French composer, was born May 13 in Bordeaux. He received his early musical training at the Paris conservatory, was awarded the Prix de Rome in 1903, and won international fame with one of his early compositions, *La Habañera*, 1908, an opera set in old Castile. His other operas included *Peau d'Ane* (1899), *La Jota* (1911), *Le Joueur de Viole* (1926) and *L'Illustre Fregona* (1931). He wrote in addition several librettos, songs, piano and orchestra works and a number of publications including *La Musique Populaire en Espagne* (1914) and *Bizet et l'Espagne* (1935). He was killed during a bombing raid over France, April 4, according to a Paris radio broadcast.

La Puma, Vincenzo, CARDINAL (1874–1943), Italian cardinal, was born Jan. 22 in Palermo. He attended Palermo seminary and studied at the University of Rome, receiving doctor's degrees in philosophy, theology and law. Titular archbishop of San Cosmos and Damian, he was created a cardinal on Dec. 16, 1935. He died in Rome Nov. 4.

Lard. The production of lard in 1943 increased to an all-time high record of 2,874,000,000 lb., as estimated by the U.S. department of agriculture, compared with 2,455,000,000 lb. in 1942. The heavy marketing of hogs in the fall of 1943 was reflected in this increase. Only once had this high record been approached—in 1933, when 2,475,000,000 lb. were produced. The lard yield in 1943 was relatively low in relation to the weight of the hogs slaughtered, indicating that packers did not trim closely, being able to sell more of the fat as meat. The output of lard bears a close relation to the weight of hogs slaughtered, however, which enables estimates to be made on the number of hogs needed to meet lard demands. For 1944 a yield of 130 lb. of pork and 30 lb. of lard per hog on 104,000,000 head was expected to provide 3,120,000,000 lb. of lard. (*See* also HOGS; MEAT; VEGETABLE OILS AND ANIMAL FATS.) (J. C. Ms.)

Latvia. One of the Baltic states of northeastern Europe, north of Lithuania, south of Estonia, formerly a republic; in 1941 it became part of the German "Ostland." Area, 25,016 sq.mi.; pop. (est. Jan. 1, 1939), 1,994,506. Capital, Riga (385,063 in 1935); the other principal city is Liepaja (57,098). Language, Latvian. Religion, Christian (Protestant, 56%; Roman Catholic, 24.5%; Greek Catholic, 9%; Greek Orthodox, 5.5%). The country was ruled, after the German occupation in 1941, by Commissioner-General Otto Heinrich Drechsler for Latvia, and Reichscommissar Hinrich Lohse, whose seat of government not only for Latvia but for the entire Ostland (*q.v.*) was established in Riga.

History.—Like her neighbours Estonia and Lithuania (*qq.v.*), Latvia was forced to bow first to one, then another, of the warring great powers: from June 1940 to June 1941 she was occupied and largely collectivized by the U.S.S.R.; in July 1941 she was occupied and "new ordered" by the nazi reich. Mass deportations were carried through by both the conquerors, and the economy was forced through violent changes.

The German masters of the country required the Latvians to produce for the German war effort, systematically regulating labour, banks, industry. Agriculture, partially collectivized during the Russian occupation, was not completely reorganized by the Germans, though some Danish and Belgian colonists were established on the land. Most of the Latvian ships at large were sunk before the end of 1943, but some Latvian sailors continued to operate in the Atlantic sea-lanes.

A communist government-in-exile was established in Moscow,

and the representatives of the prewar government continued to function in the western capitals in 1943. The latter pledged allegiance to the Atlantic Charter and the cause of the United Nations and hoped for the re-establishment of Latvian independence after the war. No clear-cut statements on this issue had been promulgated by the great states at the end of 1943. The silence of the Moscow and Tehran conferences on this point was in itself significant.

Statistics of education, finance and economic conditions ceased to be issued in Latvia after the soviet occupation in 1940; the latest available figures at the end of 1943 applied for the most part to 1938 and 1939.

Education.—In 1938–39 there were 1,987 elementary schools and 122 secondary schools. Enrolment at the University of Riga was 7,281. Total educational enrolment numbered 271,197—one-seventh of the population with 13,106 teachers. There were 912 public libraries.

Finance.—The monetary unit is the lat (=19.3 U.S. cents at par, established as equivalent to the Swiss franc in 1921). Effects of German control were still uncertain at the end of 1943. In 1939 the budget estimates envisaged revenue of 190,878,000 lats and expenditures of 190,481,000 lats.

Trade and Communication.—Imports in 1938 were 227,336,000 lats; exports 227,204,000 lats. Chief articles of import were industrial machinery, agricultural machinery, automobiles and accessories, coal, cotton textiles, cotton (raw) and wheat. Chief articles of export were timber, flax, plywood and butter. Exports went chiefly to Great Britain, Germany, the U.S.S.R. and the Netherlands. Imports were primarily from Germany, Great Britain, the U.S.S.R., Sweden and the United States. In 1940 the Latvian state railways operated over 2,200 mi.; bus lines over 2,800 mi. The principal harbours are Riga, Liepaja and Ventspils.

Agriculture.—The principal crops with their yields (in short tons) were as follows in 1939: rye, 493,830; barley, 245,041; oats, 534,395; wheat, 233,247; potatoes, 1,807,882; flax, 54,123. Livestock included 414,470 horses, 1,271,730 cattle, 1,469,570 sheep, 891,470 pigs, 4,729,120 poultry, 222,460 beehives. About 66% of the employed were in agriculture.

Manufacturing.—After the decline in 1931 and 1932, Latvia's industrial production rose rapidly to a general index figure of 148 in 1937 (based on 100 in 1930). Strong efforts were made up to 1939 to increase the self-sufficiency of the country.

At the beginning of 1939 some 5,970 industrial establishments employed 98,500 persons, and in 1938 produced a value of 695,000,000 lats. About 15% of the employed were in industry and 5% in commerce. Chief industries were foodstuffs, wood and paper and textiles.

Laval, Pierre (1883–), French statesman, was born June 28 at Châteldon, Puy-de-Dôme. For a brief biographical sketch, see *Encyclopædia Britannica*. Laval had remained in comparative obscurity after the start of war in 1939 until Marshal Pétain, after France's defeat, named him his successor as well as vice-premier. An opportunist, Laval consulted with Hitler on several occasions in 1940 and displayed obvious pro-nazi inclinations. A rift between Pétain and Laval occurred, and the latter was abruptly dropped from the Vichy cabinet Dec. 13, 1940. Laval was not reinstated until April 18, 1942, when he formed a new cabinet and assumed the title of chief of government. He followed a straight pro-nazi policy. He insisted that Frenchmen go to Germany to work in factories, thus helping to "crush bolshevism," and to release French prisoners. On Nov. 18, 1942, a week after the Germans had occupied all of France, Pétain gave Laval dictatorial powers to make laws and decrees on his own responsibility. Laval delivered a violent tirade against the British and proclaimed his confidence in an eventual axis victory. In the spring of 1943, Gen. Giraud, threatening eventual invasion of France, warned Laval: "You have lost the right to call yourself a Frenchman." On June 5, Laval called for 200,000 more workers to go to Germany. On June 25, the German radio announced that he had ordered the 100,000 Jews that had been naturalized since 1927 deprived of citizenship.

Law. Aspects of war were reflected in every type of litigation. Conflicts arose between military and civil authorities over curfew and exclusion orders in defense areas, the suspension of the writ of *habeas corpus* under a declaration of martial law and the trial of soldiers for offenses against civilians. The courts faced new problems also in determining the status of aliens who came from countries taken over by the nazis and in applying emergency laws concerning selective service, inflation control and war labour disputes.

Some litigants put forward novel claims and defenses inspired by war conditions. Tenants not only sought the protection of OPA regulations in eviction cases in rent control areas, but also resorted to a new doctrine of "frustration" (similar to the old defense of impossibility of performance) in order to escape liability for rent on leases of business property where its use for the purpose intended was wholly or partly interrupted by war regulations. In a personal injury suit the defendant car owner unsuccessfully raised the defense that the plaintiff had assumed all risks by becoming a fellow passenger in a share-the-car plan brought about by gas rationing. A manufacturer who ran his plant in a manner disturbing to neighbours contended that his operations should not be restrained as a nuisance because he was engaged in war work, but the Massachusetts supreme court rejected this plea.

The trend of U.S. supreme court decisions was to support the vastly increased powers delegated by congress to the executive department and administrative agencies and not to interfere with state legislation and court decisions except when there were serious conflicts with federal authority or civil rights were endangered.

Only the more important and interesting legal developments of a less technical nature are noted in this article.

Administrative Law.—Both by necessity and inclination the supreme court continued its hands-off policy toward the administrative process. Agency regulations and rulings have added such a vast undergrowth to the law's "wilderness of single instances" that the courts cannot review administrative proceedings in detail.

The court declined to interfere with the discretion exercised by the Federal Power commission, the Federal Security administrator, the National Labor Relations board and the Interstate Commerce commission in orders issued by those agencies based on findings of fact arrived at after the consideration of carefully accumulated evidence, much of it highly technical in character. In an NLRB case the court ruled that there could be no judicial review of questions not presented in the original hearing before the administrative agency (*Marshall Field & Co.* v. *NLRB*, 318 U.S. 253). Nor should the courts interfere with the orders of administrative tribunals until all administrative remedies are exhausted, it was held in *Illinois Commerce Commission* v. *Thomson*, 318 U.S. 675. An injunction had been granted against proceeding with a rate hearing before the state commission on the ground that the Interstate Commerce commission had already approved an increase of rates. The supreme court held that the injunction should have been denied because the petitioner had not come to the end of his remedies before the state agency.

Chain broadcasting regulations formulated by the Federal Communications commission were upheld against attacks by the two major radio networks (*N.B.C.* v. *U.S.*, 319 U.S. 190 and *Columbia Broadcasting System* v. *U.S.*, 319 U.S. 190). The regulations provided that broadcasting licences should not be granted to stations having certain business relations with the networks and they were designed to prevent practices which the commission had found, after extensive investigation, to be "detrimental to the public interest." The court held that in giving the FCC power to license and regulate broadcasting "in the public interest, convenience and necessity," congress did not limit the commission's power merely to dealing with technical and engineering problems. Nor were the regulations a denial of free speech.

The doctrine of "exclusive primary jurisdiction" was applied by the court in sustaining the power of the secretary of labour to subpoena a contractor in a hearing under the Walsh-Healey Public Contracts act. The contractor asked the federal district court to decide whether the act applied to his business, but the supreme court held that it was primarily the duty of the secretary of labour to determine this question (*Endicott-Johnson* v. *Perkins*, 317 U.S. 501).

In a series of cases involving railroad reorganizations under the Bankruptcy act, approved by the Interstate Commerce commission, the supreme court held that the federal courts should consider only the general fairness and legal validity of such plans. They need not examine the details.

Administrative agencies, however, cannot justify their orders on "broad equitable principles," the court said in setting aside an order of the Securities and Exchange commission in connection with the reorganization of a public utility holding company. "An administrative order cannot be upheld unless the grounds upon which the agency acted in exercising its powers were those upon which its action can be sustained" (*S.E.C.* v. *Chenery Co.*, 318 U.S. 80).

In two 5-to-4 decisions, the court declined to permit the interference by federal courts with orders of state administrative agencies. It held that U.S. district court had no jurisdiction to set aside orders of the Texas Railroad commission, since the Texas statutes provided a well organized system for judicial review in the state courts.

Aliens and Citizenship.—The cancellation of a naturalization certificate granted in 1927 to an admitted communist was set aside by the supreme court. The government charged that he was not attached to the principles of the constitution because of his membership in a party which advocated the overthrow of the government by violence. Justice Murphy, speaking for the majority of the court, applied the "clear and present danger" test announced by Justice Holmes in the famous World War I sedition case of *Schenck* v. *U.S.*, 249 U.S. 47. The government had not proved with requisite certainty, he said, that the attitude of the Communist party at the time when the petitioner was naturalized created a "clear and present danger of public disorder." The facts and the law should be construed as far as reasonably possible in favour of citizenship. It should not be presumed in construing the denaturalization act "that congress meant to circumscribe liberty of political thought." Justices Stone, Roberts and Frankfurter dissented on the ground that "congress, which has the power to deny citizenship to aliens altogether, may safeguard the grant of this privilege." No question of freedom of speech was involved, they said. Wendell L. Willkie represented the petitioner (*Schneiderman* v. *U.S.*, 320 U.S. 118).

A U.S. district court in California ruled that the membership of Harry Bridges in the Communist party justified the attorney-general in ordering his deportation to Australia. The Alien Registration act of 1940 requires the deportation of aliens who at or after the time of their entry have been members of any organization which advocates, or has in its possession literature, advocating the overthrow of the U.S. government by force. The attorney-general had found that Bridges was a member of two subversive organizations. The court held that neither the statute nor the deportation order violated the free speech guarantees of the constitution.

The supreme court sustained the conviction of an American citizen of Japanese descent for wilful violation of a curfew order of the western defense command which required all persons of Japanese ancestry within a designated military area to remain at home between 8 P.M. and 6 A.M. It was within the constitutional authority of congress and the president, acting together, to prescribe a curfew as a war emergency measure. Ruling that such an order was not unjust discrimination, the court said, "Distinctions between citizens solely because of their ancestry are by their very nature odious to a free people whose institutions are founded on the doctrine of equality," but "the adoption by the government, in the crisis of war and threatened invasion, of measures for the public safety, based upon the recognition of the facts and circumstances which indicate that a group of one national extraction may menace that safety more than others, is not wholly beyond the limits of the constitution" (*Hirabayashi* v. *U.S.*, 320 U.S. 81). Briefs were filed by the American Civil Liberties Union and Japanese-American Citizens' League as friends of the court.

Two U.S. district courts in the eastern defense area, however, held that there was not sufficient danger of espionage and sabotage to justify military orders excluding naturalized citizens of German origin from that area. Such orders were held to violate the constitutional right of citizens to move from state to state.

Two circuit court of appeals decisions construed the effect of the *anschluss* of Austria with Germany in 1938 on the status of aliens.

An Austrian citizen, who arrived in the U.S. in 1936 as a Czechoslovakian quota immigrant and was residing in the U.S. at time of *anschluss* but never accepted German sovereignty, was not an enemy alien subject to internment (*U.S. ex rel. Schwarzkopf* v. *Uhl*, 137 F. [2d] 898). On the other hand, a person born in Austria, who resided in France from 1919 to 1939 and then went to the U.S., was a "native" of Germany subject to restraint as an enemy alien because of state department rulings that Austria became part of the reich by the *anschluss* (*U.S. ex rel. D'Esquiva* v. *Uhl*, 137 F. [2d] 903).

The problem of deporting a Greek seaman who had overstayed his permissible period in the U.S. was solved in a circuit court decision by ordering him sent to the "Greek government in exile" in England as the "country whence he came." Congress afterward by statute established this as the proper method of dealing with such aliens.

Civil Rights.—At the insistence of members of Jehovah's Witnesses, the supreme court overruled its previous "flag salute" and "handbill" decisions. A state law, prescribing "the commonly accepted salute to the flag" as a regular part of the program of public schools, was held to violate the 1st and 14th amendments in *West Virginia Board of Education* v. *Barnette*, 319 U.S. 624. Justice Jackson, speaking for a majority of six, said that the flag salute is a form of utterance, the affirmation of a political creed. To coerce the expression of any creed through such a ritual is a violation of freedom of speech. It is not a permissible means of achieving national unity. The court thus overruled its 1941 decision in the *Gobitis* case.

The court also reversed the conviction of a Witness for violating a state statute making it a crime to disseminate literature tending to create "an attitude of stubborn refusal to salute, honour and respect" the national and state flags and governments (*Taylor* v. *Mississippi,* 319 U.S. 583).

Laws interfering with the right of Jehovah's Witnesses to spread their beliefs "publicly and from house to house" were held invalid. A Dallas ordinance forbidding the scattering of handbills was not a reasonable exercise of police power when applied to a religious broadside entitled, "Peace, Can it Last?" (*Jamison* v. *Texas,* 318 U.S. 413). An ordinance of another Texas town, making it unlawful to sell books or materials in residential districts without the issuance of a permit by the mayor, if he deemed it advisable "after a thorough investigation," abridged freedom of religion, speech and press (*Largent* v. *Texas,* 318 U.S. 418). In these two cases the court was unanimous. But in *Martin* v. *Struthers,* 319 U.S. 141, the Witnesses, by the margin of a 5-to-4 decision, won the right to ring door-bells and otherwise arouse householders and their families for the purpose of proselytizing and distributing religious dodgers in spite of an ordinance forbidding the practice. Even if such activities were obnoxious to a majority of the citizens they could not legally be banned. In *Murdock* v. *Pennsylvania,* 319 U.S. 105, the court held, on the same day and by the same vote, that a 40-year-old ordinance requiring canvassers to procure a licence and pay a fee was invalid when applied to religious colporteurs. Cities may prohibit the use of their streets for purely commercial enterprises, but the fact that religious literature is sold rather than given away does not make the enterprise commercial. To charge a licence fee for such evangelism violates the 1st and 14th amendments. In several of the handbill cases briefs were filed by such organizations as the American Civil Liberties Union, the Bill of Rights committee of the American Bar association, the American Newspaper Publishers' association and the Society of Seventh Day Adventists, as friends of the court, urging the position finally taken by the majority of the court. In a brief filed in the flag salute case the American Legion supported the view taken by the dissenting members of the court.

The extent to which an employer may express his opinions about labour unions without being guilty of unfair practices in violation of the National Labor Relations act was considered in several circuit court decisions. These and cases involving freedom of speech under statutes and ordinances regulating union activities are reported under *Labour* in this article.

Constitutional Law. *Federal Power.*—In several cases the supreme court was called upon to determine the extent of the government's power to control wages and hours under the Fair Labor Standards act. The act, by its own terms, applies only to employees who are "engaged in commerce or in the production of goods in commerce." This language, the court held, is narrower than that of other statutes, like the National Labor Relations act, which extend federal control to business "affecting" interstate commerce. The court therefore declined to apply the wages and hours act to employees whose work was only indirectly connected with interstate commerce. (*See* cases reported under *Labour* in this article.)

In two cases the court sustained the power of federal agencies to regulate public utility companies whose facilities were hooked up with those of companies in other states. Federal authority over the transmission of electricity was held in *Jersey Central P.&L. Co.* v. *FPC,* 319 U.S. 61, not to be limited to companies which themselves own interstate power lines. The court sustained the jurisdiction of the Federal Power commission over a utility company which owned and operated facilities within one state, which connected with facilities of a second company also within that state, whose facilities in turn connected with those of a third company outside the state. The same theory won out by a 5-to-3 decision in another case. An Ohio utility company bought gas from another company for delivery by pipeline from West Virginia for use in Ohio. In a hearing before the Ohio public utilities commission over the rates to be charged by the Ohio company an order was entered on the West Virginia company to present information as to the reasonableness of its charges for gas furnished the Ohio company. The West Virginia company contended that the Ohio commission had no jurisdiction over it and brought suit in a federal district court to enjoin the enforcement of the commission's order. While the suit was pending congress enacted the Natural Gas act which gave the Federal Power commission jurisdiction over interstate gas shipments. The court subsequently granted the injunction, which was sustained by the supreme court (*Pub. Ut. Comm. of Ohio* v. *United Fuel Gas Co.*).

The court seemed to recognize the existence of a national common law which has developed outside of statutory rules. It held in *Clearfield Trust Co.* v. *U.S.,* 318 U.S. 363, that "the rights and duties of the United States on commercial paper which it issues are governed by federal rather than by state law" and "in the absence of an applicable act of congress, it is for the federal courts to fashion the governing rule according to their own standards." The famous decision in *Erie* v. *Tompkins,* 304 U.S. 64, that there is no federal common law was held not to apply. On the other hand in *Palmer* v. *Hoffman,* 318 U.S. 109, the *Erie* v. *Tompkins* doctrine was applied in a grade crossing accident case tried in a federal court because of diversity of citizenship. The burden of establishing contributory negligence must be determined by state law, the court ruled.

Federal-State Relations.—In several cases of a technical nature the supreme court followed the established rule that federal and not state law controls in the application of federal statutes. The right of a farmer-debtor in Alabama to redeem after the foreclosure of a mortgage must be determined under the terms of the Bankruptcy act and not by state law. What rights are created by state law must be decided by the bankruptcy court "regardless of the characterization which may be applied to them by state statutes and decisions" (*Wragg* v. *Federal Land Bank,* 317 U.S. 325). The procedure specified by state laws was upheld by the court, however, in reversing convictions in two criminal cases on confessions obtained from the defendants while they were detained in violation of a Tennessee statute. Nor will the federal courts ordinarily restrain state officers from collecting state taxes where there is an adequate remedy under local law. The supreme court affirmed the refusal of the district court to entertain the petition to have the Louisiana Unemployment Compensation law declared unconstitutional as applied to a taxpayer and its maritime employees (*Great Lakes Dredge & Dock Co.* v. *Huffman,* 319 U.S. 293).

In accordance with this abstention doctrine the court ruled against the granting of an injunction to restrain a criminal prosecution in a state court for the violation of a city licensing ordinance by a member of Jehovah's Witnesses, even though the ordinance was held unconstitutional by the court in other cases on the same day (*Douglas* v. *Jeannette,* 319 U.S. 157).

The court worked out a reconciliation of conflicting national and state interests in holding that California's Agricultural Prorate act does not violate either the commerce clause of the constitution or the Sherman act and Agricultural Marketing Agreement act (*Parker* v. *Brown,* 317 U.S. 341). California produces almost half of the world's raisin crop, and between 90% and 95% of the raisins grown in California are shipped in interstate and foreign commerce. The California Agricultural Prorate act

set up a program for marketing state agricultural products to restrict competition among growers and maintain prices. The Sherman act did not apply because it was directed against individual action in restraint of trade, and the action here was by a state. Nor did the California program conflict with the Agricultural Marketing act since "the two acts were co-ordinate parts of a single plan for raising farm prices to parity levels." The state program was, in fact, adopted in collaboration with officials of the federal department of agriculture and aided by loans from the Commodity Credit corporation. State regulations affecting interstate commerce are to be sustained, the court said, if upon consideration of all relevant facts, the matter seems to be one appropriate for local control without materially obstructing the free flow of commerce. The court thus applied the doctrine of "accommodation" which is accomplished by "comparing the relative weights of the national and local interests involved."

A slightly different form of accommodation between national and state authority was applied in *Terminal Association* v. *Trainmen,* 318 U.S. 1. A union which was under contract to furnish labour to a railroad, asked that cabooses be provided for the health and safety of switchmen. When the railroad failed to do so, the union applied to the Illinois Commerce commission, which directed that cabooses be supplied. The railroad contended that the National Railroad Adjustment board had jurisdiction over the dispute since it involved interstate commerce. The court conceded that the federal board might have had jurisdiction also, but neither the Interstate Commerce act, nor the federal Railway Labor, Boiler Inspection or Safety Appliance acts precluded the state commission from acting.

The court arrived at opposite results in two cases involving the right of state agencies to regulate the price of milk furnished to the army. In *Penn Dairies* v. *Milk Commission,* 318 U.S. 261, it was held that milk sold for use of the army on land leased from the commonwealth of Pennsylvania was subject to prices fixed by the state milk control commission. But in *Pacific Coast Dairies* v. *Dept. of Agriculture of California,* 318 U.S. 285, state authorities were held to have no right to revoke a dealer's license for selling and delivering milk at prices below the local minimum to the army at Moffitt field, which was owned exclusively by the United States. "The conclusions may seem contradictory," said Justice Roberts, "but in preserving the balance between national and state powers, seemingly inconsequential differences often require diverse results."

The court again held the government immune to state taxation in ruling that the Florida Commercial Fertilizer law does not apply to fertilizer owned by the United States and shipped into Florida for distribution by the department of agriculture as part of the soil conservation program. The government had a right to an injunction against the enforcement of the state tax and tagging requirements (*Mayo* v. *U.S.,* 319 U.S. 441).

The federal courts must exercise great caution in dealing with disputes between states, said Justice Roberts in a case involving conflicting claims between Kansas and Colorado over the use of the Arkansas river which flows across both states. Overruling a master's findings in favour of Kansas, the supreme court stressed that both states have equal rights in such waters. The benefits of irrigation should be secured to one state without depriving the other of the use of the flowing stream (*Colorado* v. *Kansas,* 319 U.S. 729).

Criminal Law.—An advisory committee, appointed by the supreme court and headed by Arthur T. Vanderbilt, completed a draft of 56 rules of criminal procedure for the federal courts. The proposed rules include such simplifications as a short form of indictment to replace the involved forms which have been in use for a century and a single motion to dismiss instead of various technical motions. The surprise element in alibi defenses is removed by requiring the defendant, upon the government's demand, to disclose before trial the place where he claims to have been at the time of the crime. The cost of appeals is reduced by permitting counsel to print, as an appendix to his brief, only such part of the record as he desires the appellate court to read.

The conviction of the German propagandist, George Sylvester Viereck, under the Foreign Agents' Registration act was reversed by the supreme court on the ground that the statute only required the disclosure of activities of a registrant "as agent of a foreign principal" and the activities charged against the defendant were on his own behalf. Certain remarks to the jury by the prosecuting attorney were disapproved by the court as appeals to passion and prejudice (*Viereck* v. *U.S.,* 318 U.S. 236).

The supreme court also reversed two convictions based on confessions. Three members of a clan of Tennessee mountaineers were sentenced to 45 years' imprisonment for the murder of a federal revenue officer who was taking part in a night raid on a cache of "moonshine" whisky hidden near the family cemetery. The defendants were held two days for questioning before being brought before a U.S. commissioner for commitment as provided by statute. Confessions obtained during that period were improperly used against the defendants (*McNabb* v. *U.S.,* 318 U.S. 332). In the second case persons accused of conspiring to seek the destruction of federal property were held by a sheriff and FBI men for six days' questioning which was held to violate a state statute forbidding imprisonment prior to examination by a magistrate (*Anderson* v. *U.S.,* 318 U.S. 350).

Wilful failure to file an income tax return or pay the tax was held to be a misdemeanor, not a felony. A wilful and positive attempt to evade or defeat the tax is a felony (*Spies* v. *U.S.,* 317 U.S. 492). The conviction of the owner of a network of gambling houses in Chicago for large scale evasion of income taxes was approved by the supreme court.

Pretending to be an FBI agent in order to get information about a particular person violated the federal statute against impersonating an officer with "intent to defraud," even though the information thus obtained was valueless to the accused (*U.S.* v. *Lepowitch,* 318 U.S. 702).

The notorious Louis Buchalter, Emanuel Weiss and Louis Capone asked the supreme court to review their conviction of first degree murder for alleged errors during their nine-weeks' trial in a New York court, but their petition was denied. The court held that the states are free to enforce their criminal laws under such statutory provisions and common law doctrines as they deem appropriate. The supreme court will reverse the judgments of state courts in such cases only when they are inconsistent with the fundamental principles of liberty and justice.

The conviction of Boss Thomas J. Pendergast of Kansas City of a criminal contempt of court was reversed by the supreme court on the grounds that the alleged misbehaviour was barred by the three-year statute of limitations. Pendergast had been charged with taking part in a fraudulent scheme to distribute a fund deposited with a custodian by certain insurance companies in Missouri pending the outcome of rate litigation (*Pendergast* v. *U.S.,* 317 U.S. 412). This case should not be confused with the prosecution of Pendergast for income tax evasion. In another decision the court held that a federal court may punish for contempt by fine or imprisonment but not by both.

The supreme court held invalid the section of the Federal Firearms act which provides that a defendant's prior conviction of a crime of violence and his present possession of a firearm creates the presumption that such article was received by him in interstate or foreign commerce subsequent to the effective date of the statute. Such a statutory presumption violates

due process clause, because it leaves the jury free to act on the presumption alone once the specified facts are proved (*Tot* v. *U.S.*, 319 U.S. 463).

A defendant, charged with using the mails to defraud, waived his right to trial by jury and was found guilty by the court after conducting his own defense. On an appeal made on his behalf, the supreme court ruled that a defendant under indictment for felony may waive his right to a jury even though he has not had the advice of counsel. He may also waive his right to the help of counsel (*Admas* v. *U.S. ex rel. McCann*, 317 U.S. 269).

Domestic Relations.—Reverberations of the U.S. supreme court's 1942 decision in *Williams* v. *North Carolina*, 317 U.S. 287, were heard in divorce proceedings throughout the land. In the *Williams* case a man and woman had been convicted by a North Carolina court of "bigamous cohabitation." They had actually been married in Nevada after obtaining divorces in that state from their former spouses in proceedings where there was no personal service on the defendants who lived in North Carolina. The supreme court held that full faith and credit required North Carolina to recognize the Nevada divorce decrees, thus overruling the famous case of *Haddock* v. *Haddock*, 201 U.S. 562, in which a husband had left his wife in New York and got a divorce in Connecticut, serving her with notice of the suit by publication only. Upon his return to New York his wife sued him for divorce, and he set up the Connecticut decree as a defense, but the U.S. supreme court in 1906 held that full faith and credit did not require the New York court to recognize a decree obtained without personal service on the defendant. Under the *Williams* decision this is no longer the law.

Trial courts in several states held that the *Williams* decision merely eliminates the requirement of personal service on the defendant in out-of-state divorces, and that it does not preclude them from questioning the validity of such divorces where neither of the spouses was genuinely domiciled in the state granting the divorce. On this theory some courts revived the practice of enjoining the prosecution of "foreign" divorce actions against residents of their own states where it appeared that the domicile of the plaintiff was fictitious or falsely alleged.

A New York court denied custody of a child to the mother because of adultery and to the father because he was "contaminated with the germ of naziism."

Labour. *Anti-Strike Act.*—The War Labor Disputes act, also known as the Smith-Connally act, was passed by congress over the president's veto on June 25 and became effective July 1. It gave statutory recognition to the War Labor board, which had been created by the president's order. The board has jurisdiction to decide wages, hours and all other issues in any labour dispute which may lead to substantial interference with the war effort. The act also provides that when a strike is threatened in a war plant, the workers' representatives must notify the secretary of labour, the War Labor board and the National Labor Relations board, and submit a statement of the issues involved. For the next 30 days production must continue. If the dispute is not settled during this cooling-off period, then on the 30th day the NLRB shall take a secret vote to determine whether a majority of the workers wish to strike. The president is empowered to take possession of any war plant on behalf of the government whenever its operation is interrupted by a labour disturbance. The plant must be returned to its owners, however, within a period of 60 days after the restoration of its productive efficiency. Anyone who induces or instigates a strike, lock-out, slowdown or other interference with the operation of a government-controlled plant, may be punished by a fine of not more than $5,000, or imprisonment for not more than one year, or both.

An amendment to the Corrupt Practices act of 1925 was included in the War Labor Disputes act, making it unlawful for a labour organization to furnish campaign contributions in connection with any election at which presidential electors, senators or representatives are to be voted for.

Closed Shop.—A closed-shop agreement was held invalid by a federal district court in New York because the court found that it had led to a stoppage of work at an air base, thus interfering with vital war production. A Florida circuit court ruled the same way in a case that was almost identical. But the supreme court of Florida sustained a closed-shop agreement against attack by *quo warranto* proceedings in a case where a shipbuilding company was charged with an illegal conspiracy to grant a labour monopoly. The court pointed out that there had been no proof that compliance with the closed-shop agreement retarded any war work. The union had signed a no-strike pledge as part of the agreement. Moreover, such matters properly belong under federal jurisdiction through regulatory statutes (*Watson* v. *Tampa Shipbuilding Co.*).

Picketing.—Decrees of a New York court enjoining the picketing of two cafeterias were reversed by the supreme court. The lower court found that the pickets carried signs stating that the cafeterias were "unfair to organized labour" although they were actually operated by the members of a partnership without any employees. The pickets also told prospective customers that the cafeterias served bad food, and that by patronizing them "they were aiding the cause of fascism." The lower court injunctions were based on the theory that pickets should not be permitted to injure places of business by representations they knew to be false, and that the New York anti-injunction act did not apply because there was no "labour dispute." The supreme court, however, disagreed, ruling that the right to picket cannot be taken away "merely because there may have been isolated instances of abuse falling far short of violence" (*Mesevich* v. *Angelos*, Nov. 22, 1943).

An injunction against picketing was sustained by the New York court of appeals in another case because of false representations. The owner of a shoe store had a collective bargaining agreement with a union of his employees satisfactorily covering wages and working conditions. A rival union peacefully picketed the store in an attempt to force the owner to deal with it and to retaliate against the first union for picketing shoe stores employing members of the rival union. The court held that there was no labour dispute within the meaning of the state anti-injunction act. The store owner was entitled to an injunction since the signs carried by the pickets saying that he was unfair to the rival union were false (*Dinny and Robbins* v. *Davis*, 290 N.Y. 101).

The Massachusetts supreme court held that a strike for a closed shop is illegal, and that picketing by a union in order to force a closed-shop agreement upon an employer is not protected by the state picketing statute (*Fashioncraft* v. *Halpern*, 48 N.E. [2d] 1).

A contract coercively obtained from a theatre owner by a musicians' union on the threat of calling a strike of stage hands and picketing the theatre was set aside by the Michigan supreme court as invalid. The owner had a contract with the stage hands, but when he refused to employ an orchestra of six musicians, which he did not need or desire, agents of unions representing both groups of workers served a strike ultimatum on the theatre two hours before a performance was scheduled to begin. His signature to a contract obtained under such duress was not binding. There was no bona fide labour dispute (*Lafayette Dramatic Productions* v. *Ferentz*, 305 Mich. 193).

State Laws.—The Texas supreme court refused to relieve the president of a C.I.O. union from a fine and jail sentence for contempt of court in violating an injunction against his soliciting

membership without first obtaining an organizer's card from the secretary of state as required by the Texas Labor act. This provision was not a restraint on freedom of speech. The supreme court of Florida, however, ruled that a municipal ordinance forbidding labour unions to solicit fees for membership, in public places, was an unconstitutional restraint on the right of employees to organize and the right of free speech (*Pittman* v. *Nix*).

A Colorado trial court held that provisions of the state Labor Peace act, requiring unions to incorporate, was unconstitutional as a prior restraint on freedom of speech, press and assembly in violation of the 1st and 14th amendments. The remainder of the act restricting boycotts, picketing and unauthorized strikes was constitutional as a reasonable exercise of police power.

Unfair Practices.—A sweeping order of the National Labor Relations board was upheld in *Virginia Electric and Power Co.* v. *NLRB,* 319 U.S. 533. The board had directed the disestablishment of a company-dominated union, the reimbursement of dues checked off to that union, and the reinstatement of employees. The court held that the board had full power to order such affirmative action as would effectuate the policies of the National Labor Relations act.

In another case before the NLRB, while a hearing was pending on charges of unfair labour practices against an electric company, the transmission poles and towers of the company were dynamited. The hearing ended in findings against the company and the company asked the board to reopen the case and hear evidence that union officers and members committed the dynamiting. The board refused, but on appeal to the circuit court the board was ordered to reopen the case, hear the offered evidence of sabotage and report its findings to the reviewing court. The supreme court affirmed this order (*NLRB* v. *I. and M. Electric Co.,* 318 U.S. 9).

An employer who persuaded employees to sign individual contracts in order to eliminate outside unions as collective bargaining agents was found by the NLRB to be engaged in unfair labour practices and was directed to cease giving effect to such contracts. This order was sustained on appeal to the circuit court (*Western Cartridge Co.* v. *NLRB*). In another opinion the same court held that an employer could not refuse to bargain with a union on the ground that his relations with his employees were controlled by contracts which were made before the time when the NLRA went into effect (*NLRB* v. *Case Co.*).

The extent to which employers may express their opinions about unions was considered in several circuit court opinions. In one case it was held that a newspaper publisher had the right to tell his employees that a particular union was "terrible" and not a reputable organization. This was not an unfair labour practice since it did not amount to threats tending to coerce his employees. It was also held proper for another employer to express his opinion about the selection by his employees of a certain union as a bargaining agent as long as he did not threaten reprisals against those who might disagree. But statements that a union was organized by racketeers, that workers would gain nothing by joining it, and that a former employee was discharged for strike activity, did constitute unfair practices in violation of the NLRA, according to another circuit court ruling.

Wages and Hours.—The status of employees under the Wages and Hours act depends upon the nature of the activity of the workers rather than upon the business of the employer. In determining whether a particular type of activity came within the act, the court applied the test of the "continuity of the flow of goods in interstate commerce." In *Walling* v. *Jacksonville Paper Co.,* 317 U.S. 564, employees who handled intrastate deliveries of paper were held subject to the Wages and Hours act since the paper was procured outside the state and remained only temporarily in the employer's warehouses within the state. The paper retained its character of goods in interstate commerce even though the actual sales and deliveries were wholly within the state. In *Higgins* v. *Carr Bros. Co.,* 317 U.S. 572, however, the court held that the FLSA did not apply to employees of a produce concern which obtained its goods both from local producers and dealers outside the state but unloaded them for redistribution in the local trade. Here the interstate movement had ended. The fact that the employer was in competition with wholesalers doing an interstate business was not relevant. The employees in the *Walling* case were covered by the act because they delivered goods brought into the state from outside under a specific prior agreement. In the *Higgins* case the employees handled goods originating both inside and outside the state which were ordered to meet the demands of general local trade.

The problem was simpler in *Overstreet* v. *North Shore Co.,* 318 U.S. 125, where the court held that the FLSA applies to employees of a company operating a toll road and a drawbridge used for the passage of goods in interstate commerce. But in *McLeod* v. *Threlkeld,* 319 U.S. 491, it was held that a cook who served maintenance-of-way employees of an interstate railroad was not covered by the Wages and Hours act. His work was further removed from the interstate flow of goods, since the men he served were merely servicing the means for interstate transportation. In another case, which the supreme court declined to review, it was held that porters employed by the owner of an office building are not brought under the FLSA merely because the tenants of the building are engaged in interstate commerce. Similarly the New York court of appeals ruled that a porter employed by a national bank to clean its building was not subject to the Wages and Hours act, even though part of the bank's business was interstate.

The FLSA was held to apply, however, to common laborers in a machinery repair shop which mainly serviced interstate commerce. The fact that the employees sometimes drove trucks to the employer's farm and did work not related to interstate business was not enough to change their classification since there was no actual separation of such services from their interstate duties.

In a case tried before the federal district court in New York, the child labour provisions of the FLSA were applied to an interstate telegraph company in spite of its contention that its messages were not "shipments in interstate commerce" and that the act applies only to producers of tangible goods which can actually be shipped.

An indictment under the Civil Rights act of 1870 against employers and union officials for conspiracy to violate the FLSA overtime provisions was held improper. The charge was that the employees had been intimidated into refraining from asserting their rights under the FLSA. The district court said this was not covered by the Civil Rights act which was designed to punish infringement of rights guaranteed by the 14th and 15th amendments. The prosecution should have been brought under the penal provisions of the FLSA.

Military Jurisdiction.—Conflicts between the military and civil authorities were resolved in several cases. A U.S. citizen in Hawaii was imprisoned by military authorities upon the suspicion that he was engaged in disloyal activities. The governor, with the president's approval, had declared martial law and suspended the writ of *habeas corpus.* The circuit court held that such measures were properly taken in the interest of public safety in wartime (*Zimmerman* v. *Walker,* 132 F. [2d] 442).

The supreme court held that the federal courts have no jurisdiction to try soldiers for criminal offenses committed on land acquired by the U.S. unless the government has accepted jurisdiction by filing notice with the governor of the state in which

the land is situated or by similar appropriate action, since such procedure is specified by a federal statute. The court therefore ruled that the conviction of three soldiers by a federal district court for rape committed at an army camp in Louisiana was improper because the government had never formally accepted jurisdiction over the land (*Adams* v. *U.S.*, 319 U.S. 312). The court, however, did not indicate in its opinion that there had been any controversy between military and civil authorities in this case.

The warden of the city prison was ordered by a New York court to turn over to army authorities a soldier charged with assault on a civilian. In times of peace the civil authorities have precedence in the trial of such defendants, the court said, but in wartime they are subject to military law. Similarly a federal district court held that a civilian employee of an aircraft company working at a military depot in Eritrea was subject to court martial on a charge of stealing jewellery. He was a person "accompanying the army in the field" subject to military law under the articles of war even though all of his work was on British aircraft.

A civilian cook working for a steamship company operating a ship under contract with the U.S. government discovered that he was subject to army court martial for desertion when he left the ship without the consent of the captain just before it sailed from an army base as a troop transport. The fact that he intended to take service on a merchant vessel and was not informed that the ship was to be a transport before he joined it, was no defense, according to a district court decision. He was properly tried by an army rather than a navy court martial.

A different conclusion was reached in Alabama. A soldier, charged with rape, was arrested and held by state officers. The federal district court refused a writ of *habeas corpus* for delivery of the soldier to military authorities for trial. The articles of war, the court said, require military authorities to surrender to state officers persons in military service charged with certain offenses, "except in time of war." But this exception does not give the army exclusive jurisdiction in wartime or require the state to surrender jurisdiction on demand of the military.

Patents.—The National Patent Planning commission, established in 1941 by executive order to conduct a survey and study of the United States patent system, issued a report proposing changes in the law. Among them are provisions (1) that all patent agreements must be recorded with the patent office, so that secret, improper and illegal agreements may be exposed; (2) for the cancellation of patents which later information shows should not have been issued; (3) for a public register of patents under which the owners are willing to grant licences on reasonable terms; (4) that if the court finds in an infringement suit that the manufacture of the invention by the infringer is necessary to the national defense or required by public health or safety, the patent owner may be limited to the recovery of reasonable compensation without stopping the continued use of the invention; (5) that congress should establish an objective test for the patent ability of an invention on the basis of its value in advancing the arts and sciences; (6) that the present term of 17 years for a patent be retained, but that the protection of the patent laws shall not extend for more than 20 years beyond the time when a patent is first applied for, so that delays of more than three years in the prosecution of an application would shorten the 17 year term to a corresponding extent; and (7) that the court of customs and patent appeals be designated as the sole tribunal to review the denial of a patent by the patent office.

Public Contracts.—The supreme court sustained a judgment of $315,000 against electrical contractors for collusive bidding on PWA projects in the Pittsburgh area. The suit was brought by informers under the 1862 false claims statute which entitled them to one-half of the amount recovered. The fact that the defendants had already been fined $54,000 in a criminal action for the same fraud was not a defense to the informers' suit which did not place them twice in jeopardy within the meaning of the 5th amendment (*Marcus* v. *Hess*, 317 U.S. 537). Informers in a subsequent suit against different defendants did not fare so well. Federal attorneys intervened by filing both civil and criminal proceedings against the defendants and asked for a stay of the prior suit brought by the informers. The circuit court of appeals, 8th circuit, held that the government was entitled to precedence in the trial of such cases, if it has proceeded with due diligence. It should not be placed in a position of having to rush into court without careful preparation in order to forestall action by informers.

All contracts for sales in excess of $100,000 to the war, navy and treasury departments and to the maritime commission were subject to renegotiation under the Renegotiation act. By amendments adopted in July, congress extended the act to four subsidiaries of the Reconstruction Finance corporation and redefined "sub-contracts." The government agencies involved in the renegotiation process adopted a policy of allowing a greater profit margin to contractors who succeeded in lowering the cost of war goods through greater production efficiency.

A corporation executive was convicted of violating the criminal provisions of the Renegotiation act in connection with contracts with the navy department. In response to a request for a statement of the actual cost of production, he had referred a government representative to the corporation's books, knowing that they contained improper items of expense.

Social Security.—The provision of the Federal Social Security act, which exempts maritime employers from the federal tax does not operate to exempt them from the New York unemployment insurance taxes, according to a supreme court decision (*Standard Dredging Co.* v. *Murphy*, 319 U.S. 306).

The supreme court of the state of Washington held that trainmen members of a minority union were not directly interested in a strike called by a majority union of logging loaders so as to preclude them from the benefits of the unemployment compensation act (*Wicklund* v. *Com'r. of Unemp. Comp.*, June 17).

The Utah supreme court ruled, however, that members of a minority union which objected to a strike called by a majority union were not entitled to unemployment compensation under the state act which denies benefits to workers of the "grade, class or group" of those fomenting a strike (*Iron Workers Union* v. *Industrial Comm. of Utah*, June 25).

The N.J. Unemployment Compensation law was upheld by the state supreme court against charges that it violated the 14th amendment (*Wiley Motors, Inc.* v. *Unemployment Compensation Comm. of N.J.*).

The Pennsylvania supreme court held invalid a law granting bonuses to the dependents of state employees, who went into war service, characterizing the statute as "fraternalism run riot" (*Kurtz* v. *Pittsburgh*).

The Vocational Rehabilitation act, which provides federal aid to states for the rehabilitation of persons disabled in industry and their return to employment, was amended. Congress set up specific standards for state plans for rehabilitation which must be approved by the federal security administrator before a state can qualify for such federal aid.

Taxation.—The pay-as-you-go system went into effect under the Current Tax Payment act of 1943 which provides for the payment of income and victory taxes for the current year in quarterly instalments. The law requires certain employers to withhold (on behalf of the government) 20% of wages and salaries in excess of exemptions to apply on the taxes of em-

"PICK ONE OUT, Ma, So I Can Go Back to Work." The indecision of Congress about passing a pay-as-you-go tax plan before adopting the final bill in June 1943, expressed in this cartoon by Lewis in the *Milwaukee Journal*

ployees. Some classes of employees are not subject to the withholding provisions. In order to lighten the burden of changing over to a current basis, taxpayers are forgiven 75% of their 1942 or 1943 tax, whichever is smaller. An anti-windfall provision cuts down the amount of forgiveness on large incomes resulting from war conditions. Special exemptions and allowances are given to members of the armed forces. The new law, however, does not change previous tax rates nor apply to the incomes of estates, trusts and corporations. Taxpayers must still file final returns on or before March 15 for income during the preceding year. The rate of the victory tax was lowered by amendments adopted Oct. 28.

The supreme court refused the government's request that *Eisner* v. *Macomber,* 252 U.S. 189, be overruled, re-affirming its position that a stock dividend is not income unless it changes the holder's proportionate interest in the corporation (*Helvering* v. *Sprouse,* 318 U.S. 604, and other cases). The courts also passed on various other technical phases of the income tax laws.

In an opinion of interest to real estate buyers and mortgagees, the supreme court held that a federal estate tax lien attaches to real estate at the date of a decedent's death without assessment demand or recording. Such liens are superior to the liens of subsequent mortgages even though the mortgagee lends money in good faith without knowledge of the lien (*Detroit Bank* v. *U.S.,* 317 U.S. 329). Similarly a federal estate tax lien on real estate takes precedence over later liens for state, county and city taxes (*Michigan* v. *U.S.,* 317 U.S. 338).

The attempt of the Tennessee legislature to repeal the state poll tax was held invalid by the state supreme court on a technical point of constitutional law (*Biggs* v. *Beeler*). The Ohio supreme court held that sales of trailers to out-of-state buyers are subject to the Ohio sales tax. Collection of the tax was not a violation of the interstate commerce clause of the federal constitution (*Trotwood Trailers* v. *Evatt*). Offices of a company in Texas where mail orders were accepted and forwarded to its main office are chain stores taxable as such, ruled the Texas supreme court (*Montgomery Ward* v. *Texas*). The ruling in *Grosjean* v. *American Press Co.,* 297 U.S. 233, was applied by the Florida supreme court in holding that a municipal ordinance imposing an annual licence tax on newspapers on a graduated scale based on volume of circulation was unconstitutional as a restraint on press freedom (*City of Tampa* v. *Tampa Times*). Inheritance taxes imposed by Oklahoma on estates of deceased members of the Five Civilized Tribes was validly applied to cash and securities held for the Indians by the secretary of the interior (*Okla. Tax Comm.* v. *U.S.,* 319 U.S. 598).

Trade Regulation.—Two medical societies were convicted of conspiring to violate the Sherman act by obstructing the business of Group Health, a non-profit corporation organized by government employees in the District of Columbia to provide medical care and hospitalization on a risk-sharing prepayment basis. Group Health employed full-time physicians paid by salaries. The medical societies were charged with trying to prevent Group Health from carrying on its business by restraining their own members from working for Group Health or consulting with doctors employed by Group Health and by persuading hospitals in Washington, D.C., to refuse their facilities to patients of Group Health's doctors. In sustaining the conviction of the medical societies, the supreme court held that it was not necessary to decide whether the practice of medicine was a trade. Group Health was engaged in "trade" within the meaning of the Sherman act. Nor was the dispute between the medical societies and Group Health one "concerning terms and conditions of employment," within the meaning of the Clayton act as expanded by the Norris-LaGuardia act, so as to exempt the medical societies from the operation of the Sherman act (*American Medical Ass'n* v. *U.S.,* 317 U.S. 519).

The much-publicized prosecution of the Associated Press under the Sherman and Clayton acts before a three-judge district court resulted in a decree restraining the defendant press association from "continuing to enforce its by-laws in their present form." It was left open to the A.P. to adopt substitute by-laws restricting admission to membership, "provided that members in the same field with the applicant shall not have power to impose, or dispense with, any conditions upon his admission, and that the by-laws shall affirmatively declare that the effect of admission upon the ability of an applicant to compete with members in the same field shall not be taken into consideration in passing upon his application." The by-laws which were found objectionable provided that if an applicant is operating in the same field as an existing member, and his application is approved by a majority of members, he may be admitted upon paying 10% of the regular assessments paid to the association members in that field from Oct. 1, 1900, to the time of his election. This was held to be an unreasonable restraint of trade. Two other actions of the association, which the government complained of, were held not to violate the anti-trust laws, namely, the purchase of all the shares of Wide World Photos and an alleged "cartel" with the Canadian Press association under which each organization agreed to furnish its news to the other to the exclusion of nonmembers (*U.S.* v. *A.P.,* 52 F. Supp. 362).

In *Parker* v. *Brown,* 317 U.S. 341 (discussed under *Constitutional Law*), the court held that a state may create a combination in restraint of trade without violating the federal antitrust laws.

An exchange of information among members of a wholesalers association in order to blacklist manufacturers who were selling directly to retailers was held by a circuit court to violate the Sherman act. A district court ruled that an agreement between a union and employers restricting the use of spray equipment for painting was a reasonable health measure and not an antitrust law violation. A 100% monopoly of the business of furnishing sleeping car service to railroads was held by another district court to be a violation of the Sherman act even though "nonpredatory." A manufacturer who agreed with a retailer not to sell coats to the retailer's competitor, in consideration of a promise of indemnity against loss, violated the New York antitrust law, according to the state's court of appeals.

The Kansas Filled Milk act, banning the use of non-milk fats in milk products, was upheld by the state supreme court in a case involving the use of cottonseed oil. The law was a proper exercise of legislative judgment in the interest of public health.

The North Dakota supreme court held that a statute designed to regulate the practice of professional photography, through examination and licensing, was unconstitutional as an improper exercise of police power.

The Wisconsin act establishing a "State Bar of Wisconsin" to which all lawyers practicing in the state must belong was approved by the state supreme court but the effective date for its operation was postponed till the end of World War II.

The supreme court of Ohio held a Cincinnati ordinance limiting business hours of barber shops unconstitutional as an improper exercise of police power. It had no real relation to health, safety, morals or general welfare of public.

The federal trade commission properly ordered a manufacturer to cease and desist from using the letters "M.D." either alone or in conjunction with the picture of a doctor, nurse or a cross on medicated powder, since it conveyed the false impression that the product was indorsed by the medical profession or the Red Cross (*Stanley Lab.* v. *FTC*). So, too, an order of the commission was upheld which directed a manufacturer to cease using "Scout," "Boy Scout" and "Scouting" in connection with knives sold because it gave the false impression that they were sponsored by the Boy Scouts of America.

The federal security administrator has the power to promulgate regulations fixing reasonable "standards of identity" for foods under their common names to prevent the misleading of consumers, the supreme court held.

Treason.—The conviction of the Detroit traitor, Max Stephan, for harbouring a German war prisoner who had escaped from Canada and supplying him with food, clothing and money, was sustained by the circuit court of appeals, 6th circuit, in the first treason case to reach the courts. The supreme court refused to review the decision. The treason conviction of Anthony Cramer for aiding the nazi saboteurs, Thiel and Kerling, who landed from a U-boat, was also sustained. But the circuit court for the 7th circuit reversed the conviction for treason of the father, mother, uncle, aunt and two friends of another saboteur, Hans Max Haupt, because of the use in evidence of admissions made by the defendants during a period of several weeks in custody of the FBI. The defendants should have been brought before a committing officer immediately after their arrest as required by statute. This provision is mandatory on the arresting officers and cannot be waived by the defendants as the government contended it had been.

War Regulations.—The government continued to exercise wartime controls over communications, transportation, manpower, labour disputes, foreign commerce and credits, property of enemy aliens, food, fuel, rents and prices, wages and hours, materials and production. Business men faced an increasing volume of paper work resulting from the necessity for organizing and applying economic resources most effectively for the prosecution of the war. No person escaped the effects of this marshalling of industrial and human forces.

Price and Rent Control.—The Office of Price Administration broke all federal bureau records in the bulk of its output of legalistic literature. This was no doubt inevitable in view of the enormous task delegated to this agency of devising and enforcing price schedules and techniques for rent control and rationing. According to Justice Magruder, a member of the emergency court of appeals created by the Price Control act: "The administrator had to move promptly, on the broadest possible front; he had to get out regulations covering great numbers of commodities, affecting a wide range of industries, the full comprehension of each of which is a lifetime study. He could not afford to be a perfectionist in getting the program started."

In a unanimous decision the supreme court ruled that the emergency court of appeals has exclusive jurisdiction to restrain the enforcement of regulations or price orders under that act, subject, however, to review by the supreme court. The action of the district court in dismissing the application of wholesale meat dealers for an injunction against a maximum price regulation was affirmed. The petitioners should have pursued the administrative remedy provided by the statute, namely, to file a protest with the price administrator, and if the protest were denied, to appeal to the emergency court (*Lockerty* v. *U.S.*, 319 U.S. 182). From this and circuit court decisions it would appear that the emergency court has exclusive jurisdiction to determine the validity of price regulations. The emergency court held that rent control is not a violation of the due process clause nor an improper delegation of legislative power.

The California supreme court held that an action by a consumer to recover a $50 penalty for an overcharge of 25 cents in connection with a tire inspection was maintainable in a state court. The validity of the price regulations may not be challenged in such a case.

Defendant may, however, attack the constitutionality of the act, but the court held that it was not an illegal delegation of legislative power (*Miller* v. *Municipal Court*). On the same theory the Pennsylvania supreme court sustained a judgment for treble damages for a price violation. But such a suit must be brought in good faith. A defendant who was sued for treble damages in a New York court successfully raised the defense that the complainants conspired among themselves to induce him to violate the act. He claimed that he was ignorant of the price ceiling and that the complainants had persuaded him to violate the regulations for the sole purpose of suing him for damages for such violation. No man may take advantage of his own wrong, said the court in dismissing the suit. Another collusive suit, but this time between a landlord and tenant who agreed upon this method of testing the constitutionality of the Price Control act, was dismissed by a federal district court on motion of government counsel. The supreme court affirmed the dismissal (*U.S.* v. *Johnson*, 319 U.S. 302).

A district court held that a deputy of the price administrator's office has no right to conduct secret hearings for the examination of buyers of meat products. Witnesses, called for such examination, may be accompanied by counsel and a stenographer who may take notes as members of the public. But counsel has no right to interrupt or take part in the proceedings.

Utility rates are excluded from the matters over which the price administrator was given power except that he has the right to intervene and to be heard in rate cases, according to a decision of the court of appeals of the District of Columbia.

Selective Service.—The supreme court held that a registrant's contention that an appeal board had rejected his claim through a misconstruction of the Selective Service act was not a proper defense to a prosecution for failure to obey an induction order where it appeared that the director of selective service had ruled as a matter of fact that the registrant was not a bona fide conscientious objector (*Bowles* v. *U.S.*, 319 U.S. 33).

A registrant who was under arrest for failure to obey an induction order tried to get a review of his draft classification by *habeas corpus* proceedings on the ground that his local board had been arbitrary and unfair, but the circuit court of appeals held that compliance with an induction order is a prerequisite to contesting a registrant's classification in court. A registrant, however, who furnished his board with the address of his mari-

time union as his forwarding address was not guilty of knowing failure to keep his board advised of the address where mail could reach him since the union office was part of a chain of forwarding addresses (*Bartchy* v. *U.S.*, 319 U.S. 484).

Opposition to war "not on political considerations but on a general humanitarian concept . . . essentially religious in character" may entitle a registrant to classification as a conscientious objector, according to a circuit court of appeals decision. But objection to military service for philosophical and political reasons pertinent only to the present war was held by a district court not to exempt another registrant "by reason of religious training and belief."

Soldiers' and Sailors' Relief Act.—The supreme court held that the stay of court proceedings against persons serving in the armed forces provided by statute, is discretionary with the trial court. A defendant, who was a commissioned officer and had taken part in the trial of a case as an attorney and trustee, did not have the absolute right to a continuance under the relief act (*Boone* v. *Lightner*, 319 U.S. 561). Lead. There were no new data available for addition to the accompanying table of world production of lead, and many of the figures for 1940 and 1941 shown are estimates; only those carrying a decimal point are reported outputs.

World Production of Lead
(In thousands of metric tons)

	1929	1937	1938	1939	1940	1941
Australia	177.3	234.4	235.7	252.4	280	315
Belgium	62.2	88.0	90.5	96.0	55	20
Canada	148.0	186.4	185.7	177.9	215	220
Germany	97.9	162.4	171.7	181.4	200	225
Burma	81.5	78.9	81.4	78.6	83	84
Mexico	248.8	231.2	242.7	215.7	196.3	155.3
Spain	133.3	30.0	36.0	27.0	56	57
U.S.S.R.	6.2	55.0	69.0	75.0	80	90
United States	624.2	426.3	344.4	381.4	389.2	438.2
World Total	1,756.8	1,719.6	1,704.2	1,722.7	1,800	1,850
Ex. U.S.	1,132.6	1,293.3	1,359.8	1,341.3	1,511	1,412

There was an increase in mine production of lead in the United States, from 461,426 short tons of recoverable metal in 1941 to 492,435 tons in 1942, an improvement of 7%. Increases totaling 47,262 tons were reported from 12 states, while the same number had decreases totaling 16,253 tons, leaving a net increase of 31,009 tons. The only producing area to show an appreciable increase in output was southwestern Missouri; the combined increases in other areas were offset by the decreases. The output of refined lead decreased from 470,517 tons in 1941 to 467,367 tons in 1942, but antimonial lead more than compensated for this drop, with an increase from 40,237 tons to 51,762 tons. No data was received for 1943, but apparently the shortage of manpower resulted in some decrease, since it was reported that after the first quarter of the year some withdrawals from the stockpile were found necessary.

Lead still remained listed with the metals of which there was a surplus of supply, available for substitution for scarcer metals, but at the end of 1943 it was several points higher in the list, as a result of the reduction in supply. Apparently the reduction was not considered to be a threat of impending scarcity, since it was announced at the end of October that premium prices had been withdrawn for certain classes of mines.

Advance estimates indicated a decrease in consumption of lead in small arms ammunition in 1944, but this was expected to be offset by increases in other uses, giving a final figure not much if any different from that of 1943. The mine production was expected to furnish only about 40% of the total consumption, the remainder coming from imports and secondary lead.

It was unofficially reported that lead production in Canada in 1942 was 243,800 short tons. (*See* also BUSINESS REVIEW.)
(G. A. RO.)

League of Nations. It is doubtful if the nonpolitical organs of the League of Nations, functioning in four separate countries, had ever done more important work than during 1943. The economic department at Princeton furnished the Hot Springs conference with a report on the league's work on nutrition, which was the documentary background of the most successful international conference during World War II. The economic and financial departments produced a remarkable series of studies on postwar problems: *Wartime Rationing and Consumption, Money and Banking, Relief Deliveries and Relief Loans, Trade Relations Between Free Market and Controlled Economies.* But their two outstanding reports were *The Transition from War to Peace Economy,* admittedly the most authoritative outline of the domestic and international measures needed to avert postwar depressions and maintain high levels of production and employment; and *Europe's Overseas Needs, 1919–1920, and How They Were Met,* with its lessons drawn from the failure then to develop promptly an international plan for providing basic needs for the economic rehabilitation of devastated areas. These staff plans, as it were, for winning the peace attracted great attention among the United Nations, each serving a special purpose in connection with the United Nations' plans for giving effect to the Atlantic charter and other declarations of common policy.

Vital work on medical treatment was being done by the health section, in the standardization of sera, vitamins, and products like heparin, the recent preventive against blood clotting. Standard specimens were prepared at the National Institute of Medical Research, Hampstead, London, and sent from there to all Allied and neutral countries. The Permanent Opium board continued in collaboration with the Opium Supervisory body, Washington, to keep close check on the production, manufacture, and distribution of narcotics. In spite of the secrecy maintained by Germany and Japan about their narcotic production—the latter was still deliberately trying to poison China with drugs—the board received statistics from German-occupied countries and even Hungary and was able to keep the machinery for world-wide drug control working. Taking it all round, the value of the league's ability to provide scientific statistics, on which policies could then be based, had never been more in evidence.

The Supervisory commission, entrusted in wartime with control of the league's business, adopted a budget for 1944, amounting to some £580,000, of which 59% was to be paid by the British commonwealth on a prewar basis of contribution, as was also the case with the U.S.A., as far as concerns the International Labour Office. All the Allied countries were to contribute proportionately, with token or other payments, according to the exigencies of war. The league remained solvent, with funds sufficient for those sections of its organization which were still functioning. Geneva was still the headquarters, from which the secretary general, Sean Lester, directed the various activities, mostly by telegraphy. (*See* also DRUGS AND DRUG TRAFFIC; MANDATES; REFUGEES.)
(M. FE.)

Leahy, William Daniel (1875–), U.S. naval officer, was born at Hampton, Ia., on May 6. He was graduated from the U.S. naval academy in 1897. In

1912 he was chief of staff of the Nicaraguan occupation armies and in 1916 chief of staff in the Haitian campaign. Commissioned rear admiral in 1930, he became commander of the destroyers' scouting force in 1931, chief of the bureau of navigation in 1933 and chief of naval operations in 1937. He was commissioned vice-admiral in 1935 and admiral in 1936.

Upon his retirement from the navy in 1939, he was appointed governor of Puerto Rico. In Nov. 1940, President Roosevelt named him ambassador to the French government at Vichy. In April 1942, Roosevelt summoned Leahy to Washington "for consultations." Though one purpose of this move was to express disapproval of Vichy's policies, his primary purpose was to appoint Leahy chief of staff to the commander-in-chief. Leahy was named to this newly created post on July 21, 1942. In this capacity he accompanied the president to the international conferences held during 1943 at Quebec, Cairo and Tehran. On March 6, 1943, the president appointed Adm. Leahy to a special committee which held hearings on manpower problems.

"Lease-Lend" Act (H.R. 1776): *see* FOREIGN ECONOMIC ADMINISTRATION.

Leather. The United States leather industry was unable in 1943 to continue the record high rate of production which had been maintained through 1942. Demand for all types of leather continued as great as during the preceding year, but the inventory reserves of raw stock, tanning materials and finished leathers which had enabled the industry to meet practically all of the demands made upon it in 1942 had been used up before 1943 was well under way.

With inventory reserves eliminated, tanners were forced to depend upon reduced domestic production and declining imports of cattle hides, kipskins and calfskins, and production of these leathers in 1943 was well below that of 1942. In other types of leathers the production decline was not generally as serious as in cattle-hide leathers, but it was estimated that total production of all leathers during the year was around 25% below 1942. There was no information available for publication at the close of the year on leather production outside the United States.

Increased output of domestic chrome ore eased the chrome situation somewhat in 1943, and sufficient quantities of chromium chemicals were available through the year to meet the industry's needs. However, in September the War Production board issued new allocation orders covering chromium chemicals and there was some fear expressed in the tanning industry that another serious situation might develop in that quarter.

The WPB in February imposed controls on the distribution and use of vegetable tanning materials under Order M-277. The use of vegetable tanning materials was confined to the tanning of shoe, belting, harness, strap and other leather and to the manufacture of pharmaceutical products and water treatment materials. The use of vegetable tanning materials was prohibited for tanning furs and in the manufacture of crude petroleum oil or other products. In addition, the use of chestnut wood tanning materials was prohibited for the manufacture of water treatment materials. The order specifically listed both domestic and imported raw materials covered by the control.

The greatest problem in the production of domestic tanning materials in 1943 was the difficulty encountered in securing labour to provide the wood and tanning extracts. This was emphasized in the case of chestnut extract, with the situation in regard to this important tanning material becoming so serious that the WPB placed it under allocations control at the end of the year.

Many of the chemicals and other materials, as well as some dyestuffs, that were formerly used in substantial quantities by the industry were restricted, subject to allocations or in unpredictable supply through the year.

The industry also experienced shortages of most oils and greases used in tanning, and the use of many of these was further controlled by government regulations from time to time during the year.

Maintenance of tanning machinery and equipment was a problem, since replacements were practically halted by WPB regulations on production and sale of new and used equipment, and the industry found it difficult to obtain repair parts promptly.

The sole leather problem continued unabated through 1943, and resulted in the introduction of numerous substitute materials which served the double purpose of alleviating the sole leather shortage and of enabling the shoe industry to make nonrationed types of footwear. Many of these substitutes were purely experimental, many were of highly questionable value, but a few were expected to continue in use after the war.

The National Bureau of Standards tested hot oil and wax treatments intended to increase the wear life of sole leather and reported that these extended the life of the leather 15% and 40% respectively over that of untreated leather. The WPB recommended these treatments for adoption by the shoe industry. The WPB also included specifications for minimum quality of shoe soles in a revision of Conservation Order M-217 (Footwear).

Producers of side and kip upper leathers were limited by the WPB to a monthly production quota of 70% of average 1942 monthly output for side leathers and 90% for kip leathers. In addition, numerous government restrictions were imposed on the use of side and kip leathers, with military and lend-lease requirements getting first call, followed by essential civilian requirements, with the diversion of as much leather as possible into the manufacture of footwear.

Calf-leather production was first restricted to a monthly quota of 90% of the 1942 rate, and this was reduced later in the year to 80% in an effort to secure equitable distribution of available raw-stock supplies. Tanners of calf leather were required to process into leather for navy footwear all raw stock suitable for that purpose, and deliveries of military weights and grades were reserved exclusively for manufacturers of navy shoes. This created a broad gap in the calf-leather supply which the spreading out of other weights and grades of calf leather, and the substitution of side and kip leathers, did not fill.

The most important factors affecting kid and goat leathers in 1943 were the reopening of some important raw-stock supply sections and government measures taken through the year to make more of these leathers available for footwear by curbing their use for other purposes. Requirements for goatskin leathers for military garments in 1943 eased off from the preceding year, but requirements for these leathers for work gloves and other essential civilian purposes increased.

Domestic production of sheep and lambskins was high in 1943, and large imports added to the supply of raw stock for sheepskin leather tanners. Restrictions on the use of shearlings were removed by the government, making available for civilian uses large quantities of shearlings that had previously been demanded for military clothing and other military equipment.

The most significant labour developments of 1943 were the inclusion of insurance benefits in contracts negotiated by the International Fur and Leather Workers union (C.I.O.) with two Chicago tanners and a schism in the ranks of the same union in the important tanning district around Salem and Peabody, Mass. The intra-union strife resulted in a general strike called by insurgent members and their refusal to obey orders from the

War Labor board and the president to return to work and resume production of critical military leathers. The president then ordered the army to seize 13 of the 32 affected tanneries. This action was followed by a return of the strikers, referral of the dispute to the WLB for action, and the subsequent return of the tanneries to their owners. (*See* also SHOE INDUSTRY.)

(R. B. B.)

Lebanon. Independent republic, formerly French mandated territory, bordering the eastern Mediterranean. Area 3,475 sq.mi.; pop. (est.) 900,000; chief town: Beirut (cap.), 180,000. President: Sheikh Beshara el Khoury (1943). Language: Arabic; religion: mainly Mohammedan.

History.—The restoration of the constitution was proclaimed by Gen. Georges Catroux on March 18, 1943, and Dr. Ayoub Tabet was appointed head of the state with two "ministers of state," Emir Khaled Chehab and Jawad Boules, to assist him. The law empowering the government to nominate one-third of the chamber was abolished. On July 21 Tabet resigned and was succeeded by Petro Trad, a member of the Greek Orthodox community. Elections were held on Aug. 29, a dispute regarding representation in the chamber of deputies having been settled by giving 30 seats to the Christians and 25 seats to the Moslems. The new chamber met on Sept. 21 and elected Beshara el Khoury president of the republic and Sabri Hamadeh president of the chamber.

In the absence of Jean Helleu, the delegate general, at Algiers for consultation with the French Committee of National Liberation, the chamber on Nov. 8, 1943, unanimously passed a bill revising the clauses of the constitution which were incompatible with full sovereignty. On Nov. 11 Pres. Khoury, the prime minister and seven other ministers were arrested by French troops on the orders of Helleu, now returned, who dissolved the chamber and suspended the constitution, calling on Emil Eddé to carry on the administration. A general strike was called and demonstrations and rioting occurred, resulting in civilian casualties. Gen. Catroux arrived in Beirut on Nov. 16 with full powers to negotiate a settlement, R. G. Casey, British minister of state in the middle east, having already arrived on Nov. 13. On Nov. 22 President Khoury, the prime minister and other ministers were released and resumed work. The chamber met again on Nov. 24 and Riyadh as-Sulh, prime minister and minister of finance, indicated that the revision of the constitution voted on Nov. 8 was considered still to be in force. It was reported that Gen. Catroux had previously told the president that the French Committee of National Liberation, while recognizing the Riyadh as-Sulh government, did not accept the revision of the constitution. An ordinance issued by Yves Chataigneau, who replaced Helleu on Nov. 22, was announced Nov. 24, repealing the ordinance suspending the constitution. Gen. Catroux returned to Algiers Nov. 30. Lehman, Herbert H. (1878–), U.S. politician, was born March 28. He was graduated from Williams college in 1899. He later entered the textile business and in 1908 became a partner in Lehman Brothers banking house, where he remained until World War I. At the beginning of the war, he acted as treasurer and vice chairman of the Jewish Joint Distribution committee and then assisted, in a civilian capacity, Franklin Delano Roosevelt, then assistant secretary of the navy. He joined the army in Aug. 1917, was commissioned a captain and assigned to the general staff. He eventually attained the rank of colonel in the quartermaster corps and was awarded the D.S.M. in 1919. After the war Lehman returned to the banking business. In the elections of 1928, he was voted into office as lieutenant governor of New York and won re-election in 1930. He was elected governor in 1932, and won re-election in 1934 and 1936. In 1938, he ran again, defeating Thomas Dewey, to win New York's first four-year term as governor. Lehman declined a renomination in 1942 and was appointed director of foreign relief and rehabilitation by President Roosevelt. On Nov. 11, 1943, he was elected and assumed office as director general of the United Nations Relief and Rehabilitation administration.

Lemons and Limes. The United States 1943 lemon crop, almost all of which was grown in California, was estimated by the U.S. department of agriculture at 14,274,000 boxes compared with 14,940,000 in 1942. This was a relatively large crop, since the average for 1932–41 was only 10,146,000 boxes while the record year of production was 1940 with 17,236,000 boxes. Prices of lemons were high and prices received by growers were more than 50% above those of the previous year. Imports of lemons or lemon products from the Mediterranean countries were practically nothing.

The 1943 crop of limes, produced only in Florida, was estimated at 190,000 boxes compared to 175,000 in 1942. This was much above the average of 1932–41 of only 58,000 boxes.

Leonard, Adna Wright (1874–1943), U.S. clergyman, was born Nov. 2 in Cincinnati, O. He was ordained in the Methodist Episcopal Church in 1899, after graduating from New York university. He continued his studies at Drew Theological seminary and in Rome and received his D.D. at Ohio Northern in 1909. He was created bishop in 1916 and served in San Francisco, Buffalo and Pittsburgh. In 1939 he became bishop in the Washington area after the union of the Methodist Episcopal Church, South, and the Methodist Protestant Church. During World War II he served as chairman of the General Commission of U.S. Army and Navy Chaplains and in that capacity represented 31 U.S. Protestant denominations during an inspection tour of overseas U.S. camps. Bishop Leonard was killed in a plane crash in Iceland, May 3, after completing a tour of the British Isles—the first lap of a projected inspection trip which was to have included Iceland, North Africa, India and China.

Lepidolite: *see* LITHIUM MINERALS.

Leprosy. In a hospital for leprous patients, 20 volunteers were given a therapeutic trial of sulfanilamide. Six received two courses and 14 one course. The courses lasted from 6 to 12 weeks. It was the opinion of the physicians that the drug effected no improvement in the leprous condition of the patients, but that ulcers infected with other bacteria improved. These workers tried sulfanilamide therapy in 12 patients suffering with pseudoerysipelas, a severe complication of leprosy. Prompt improvement resulted in all cases. One group of experimenters treated with sulfanilamide and sulfathiazole rats and mice which had been inoculated with "rat leprosy." They con-

cluded that the drugs inhibited the development of the disease in these animals, but as soon as the medication was discontinued the leprous nodules began to grow.

Though cases of leprosy have occurred from time to time in immigrants living in the United States, the disease has shown a tendency to perpetuate itself only in the Gulf states of Florida, Louisiana and Texas. Between 100 and 200 cases of leprosy developed among Scandinavian immigrants who settled in Minnesota and adjacent states. Although no special measures were taken to prevent the spread of leprosy in these states, only seven known cases developed in the first generation of American born persons and a single doubtful case in the second generation. A similar condition existed in California where 475 cases of leprosy were reported between 1906 and 1940. Only 14 of these were thought to have contracted the disease there; the others probably were infected in their native country. More than 100 cases of leprosy were discovered in New York city but only two of these could possibly have contracted the disease there.

It is the opinion of many members of the medical profession as well as of persons not medically trained that chaulmoogra oil and its derivative are specifically curative drugs for the treatment of leprosy. An author who for many years was interested in the leprosy problem discussed the evidence relative to the employment of chaulmoogra oil in the treatment of leprosy and found no acceptable scientific data to justify its use. He explained the alleged favourable results reported for this drug by the fact, well known to experienced leprologists, that many cases of leprosy improve spontaneously even though therapy has not been instituted.

Lettuce. The production of lettuce in 1943 was estimated by the U.S. department of agriculture at 20,788,000 crates, or 14% below the total of 23,604,000 crates grown in 1942. The acreage was reduced from 156,490 in 1942 to 135,970 in 1943, which was in accord with the recommendations of the U.S. department of agriculture. This compared with an average acreage of 154,500 for the 10-year period of 1932–41. While

U. S. Seasonal Acreage and Production of Lettuce, 1943 and 1942

	Acreage		Production (Crates)

Late (2)	32,530	30,000	4,857,000	4,965,000
Total	135,970	156,490	20,788,000	23,604,000

the demand continued high and prices were at ceiling levels, the shipments were restricted. The production of the early crop was above the average but the intermediate and late crops were reduced. Much of the demand was supplied by victory gardeners. The consumption of lettuce steadily increased after the sandwich lunch was adopted in cities and factories.

(J. C. Ms.)

Lewis, John Llewellyn (1880–), U.S. labour leader, was born Feb. 12 in Lucas, Ia., the son of a Welsh coal miner. After seven years of schooling he was compelled, because of his family's financial need, to desert

U.S. CARTOONISTS almost without exception raged at John L. Lewis as he ordered coal miners to strike April 30, 1943. This cartoon by Bishop of the *St. Louis Star-Times* is captioned "All the Land Mines are Not in Europe"

his studies and enter the mines. His success as legislative agent for the United Mine Workers of Illinois (1908–11) led to his appointment as American Federation of Labor organizer (1911–17). He returned to the U.M.W.A. as vice-president in 1917, became acting president in 1919 and since 1920 has held the post of president. Lewis had long favoured industrial organization of open-shop mass production industries, contrary to traditional A.F. of L. craft unionism. In 1935 he formed the Committee for Industrial Organization. When he refused to heed the A.F. of L. executive council's order to dissolve the committee, the participating unions in the C.I.O. were suspended in 1936 and the following year were expelled from A.F. of L. membership.

Lewis supported Roosevelt in 1936, the C.I.O. donating $500,000 to the Democratic campaign funds. However, there was a distinct cooling-off between the two men after Roosevelt in 1937 refused to give more than lukewarm support to his labour adherents. Embittered by Roosevelt's change of attitude, Lewis supported Willkie in 1940, and promised to resign if Willkie lost. He made good his promise although he retained the U.M.W.A. presidency.

Lewis made several attempts to regain lost prestige and power, and early in 1942 endeavoured to bring 3,000,000 dairy farmers into his catch-all union, District 50. His antagonism to C.I.O. President Philip Murray had become so great that at the convention in Oct. 1942, he led the U.M.W.A. out of the C.I.O. and in 1943 he negotiated for re-entry into the A.F. of L. The period from May to Nov. 1943, was marked by a series of mine workers' walkouts. Lewis demanded wage increases to offset rising prices and rejected the decisions of the WLB, which held to the "little steel formula." After the fourth walkout in a six-month period, the miners reached an agreement on Nov. 3, 1943.

Liberal Party. The Liberal Parliamentary party expressed dissatisfaction with the government's attitude towards the Beveridge report and subsequently, through the organization in the country, the Liberal party made it clear that they accepted wholeheartedly the proposals for social security which Sir William Beveridge, himself a Liberal, had effectively established as a major political issue.

At the annual assembly of the party the restatement of post-

war Liberal policy, begun the previous year, was completed by the presentation of the reports of many research committees. During the autumn the prospects of a speaker's conference aroused hopes amongst Liberals that by improved electoral machinery the house of commons in the postwar period of reconstruction might come to represent public opinion more closely than in the period between the wars.

At the beginning of 1943 E. H. Gilpin became chairman of the executive of the party. Most of the group of Liberal ministers were fully engaged in tasks connected with the prosecution of the war—Sir Archibald Sinclair at the air ministry, Major Gwilym Lloyd George transferred from the food ministry to that of fuel and power, Dingle Foot at the ministry of economic warfare, and Harcourt Johnstone in the department of overseas trade.

While the future of the Liberal party as an organized political force was still conjectural there could be little doubt that Liberal sentiment had widely increased and a fair comment by the hypothetical "man in the street" would be that the Liberal party had a great opportunity before it. (W. Rs.)

Liberia. This Negro republic on the west coast of Africa, founded by philanthropic societies from the United States in 1820 as a homeland for free Negroes, is bounded on the northwest by the British colony of Sierra Leone, and on the north and east sides by French West Africa. Area, *c.* 43,000 sq.mi. Pop. (est.), 2,500,000—of which approximately 25,000 are Americo-Liberians (descendants of the original American Negro immigrants), and the remainder are the indigenous tribes, uncivilized, and little touched by the outside world. Capital city, Monrovia (est. pop., 10,000). President in 1943, Edwin J. Barclay. Language: official, English; various tribal tongues spoken by the natives of the hinterland. Religion: official, Christian; tribal, pagan and Mohammedan chiefly.

History.—During 1943 Liberia continued to serve as an important link in the Allied war effort. Though no declaration of war was made, this little republic opened its doors completely to the military of the United States which established important air bases in the country for use in ferrying planes to Africa, the near east and the far east. Large and complete repair and service shops were set up at these air fields, and roads were built by units of the U.S. army to connect these air bases. A substantial number of American troops was kept in Liberia during 1943, many of them being Negroes.

In Jan. 1943 President Franklin D. Roosevelt flew to Liberia from the Casablanca meeting with Churchill. He was received by President Barclay, and while there, reviewed the American troops. In June 1943, President Barclay of Liberia paid a state visit to the White House in Washington, and was entertained by President and Mrs. Roosevelt. While in the United States, Mr. Barclay received medical treatment and underwent an operation at one of the American hospitals.

The year 1943 saw another presidential election in Liberia, in which the Whig party, which elected every candidate in the past, continued in power, electing its candidate, Wm. V. S. Tubman, who took office the first week of Jan. 1944.

Firestone Plantations company had planted in Liberia more than 75,000 acres of rubber of which, at the end of 1943, there was in production more than 45,000 ac. Rubber produced from the plantations of Firestone Plantations company in 1943 was approximately 35,000,000 lb. and the production from the plantations owned and operated by Liberian citizens was approximately 500,000 lb. The number of Liberian employees on the daily payroll of Firestone Plantations company, at the end of 1943, exceeded 23,000 persons.

Education.—In 1943 there was little change in the educational program of the country which is designed to serve chiefly the Americo-Liberian children on the coast. A few government schools continued to operate in the hinterland, but with difficulty. There were in 1943 an estimated 100 schools of all types in the republic. The leading institutions are the College of West Africa, Liberia College, and the Booker Washington Agricultural and Industrial Institute at Kakata, all of which were founded by American philanthropic societies.

Banking and Finance.—The revenues in 1942 fell off sharply in the early months because of the difficulty of securing shipping facilities, but regained the usual figure later in the year. Liberian government revenues for the calendar year 1942 (1943 were not available) were as follows: Hut tax, Liberian $278,171; other internal revenue, Liberian $332,260; customs revenue, Liberian $595,895; total revenue for 1942, $1,206,326. There was an increase in the amount of gold exported. The presence of American troops and the personnel of the American air bases, all brought increased amounts of money into the country. The funded foreign debt as of Nov. 30, 1942, was U.S. $1,193,000. The internal floating debt (April 30, 1943) was Liberian $112,800. Currency: effective Jan. 1, 1944, British sterling was no longer legal tender in Liberia but was replaced by the United States currency. As of Jan. 1, 1944, U.S. $1.00 equalled Liberian $1.00. Formerly £1 sterling equalled Liberian $4.80, equalled approximately U.S. $4.00. Chief Bank: the Bank of Monrovia, controlled by the Firestone Plantations company.

Trade.—Overseas trade in 1943 was limited almost completely to the United States, and increased over the previous year because of improved shipping facilities which came with the curtailing of the U-boat menace in the South Atlantic. No figures were available for the imports and exports. The chief export products during 1943 were rubber, gold, piassava, palm nuts. Foreign trade for 1942 was as follows: exports of rubber and latex $7,353,050, all other exports $797,973, total exports $8,151,023. Total imports 1942 $4,800,936. Financial adviser to the republic was John Dunaway in 1943.

Communications.—The Liberian government owns and operates a powerful radio station in Monrovia, and the Firestone Plantations company operates one on its plantations in the hinterland. There is a French cable station. The construction of motor roads was pushed by the American army engineers in 1943 in order to connect the air bases and the ports. There is an estimated 300 miles of motor roads in the republic. There are no railroads. There is air service from county to county. There are no harbours. (J. H. Fy.)

Liberty Ships: *see* Shipbuilding; Shipping, Merchant Marine.

Libraries. American libraries large and small, from the great research library to the small public library, were doing all in their power to further the successful prosecution of the war by supplying books and information required by the armed forces, by government, by industry, and, not least, by civilians. Much thought had been given to plans for postwar developments in library service, to building programs, and to the acquisition of books that would be needed for research when normal studies might be resumed. Wartime demands gave a new impetus to the use of microfilm in copying printed materials to be sent to all parts of the world. Following the pattern of the American Library in London, the British division of the Office of War Information established small reference libraries in Sydney and Melbourne, Australia; Wellington, New Zealand; Johannesburg, South Africa, and Bombay, India, to provide in-

formation about the history, institutions and culture of the United States.

Staff losses in all grades in the U.S. were so serious that many libraries were forced to curtail activities and shorten hours. Losses were greater at the clerical than at the professional level. Inadequate salaries were largely responsible in the case of those who left library positions for employment in government service or industry. In general, however, library incomes were not reduced, and many libraries were able to raise salaries. There was an encouraging extension of state aid to libraries, and some increase in appropriations to state library agencies. The total enrolment (March 1, 1943) in the 34 schools of various types accredited by the board of education for librarianship (A.L.A.) was 1,258, including 126 advanced, and 134 special or nonmatriculated students. This was a decrease of 419 as compared with 1942. The fall of 1943 saw a further drop in enrolment.

The 1943 Victory Book campaign collected 7,000,000 books of which 4,500,000 were distributed to military establishments and organizations serving the armed forces and the merchant marine at home and abroad. These books supplemented the collections provided by government funds. Books were needed for training and recreation, and there was ample testimony to the place the library fills in camps, training centres and on shipboard.

New library buildings were opened at Carroll college (Waukesha, Wis.), Davidson college (N.C.), MacAlester college (St. Paul, Minn.), and at the University of South Carolina. Three important gifts were received by the Library of Congress: a new collection of the papers of General William Tecumseh Sherman, the papers of Booker T. Washington, and the magnificent Lessing J. Rosenwald collection of manuscripts and early printed books. The Rockefeller foundation and the Carnegie corporation continued their generous support of library activities in many fields. Lists of these grants are to be found in their annual reports. A survey of the United States Army Medical library (Washington, D.C.) was made under the direction of Keyes D. Metcalf, director of the Harvard university library, with funds provided by the Rockefeller foundation. Mr. Metcalf and Dean T. C. Blegen of the University of Minnesota completed a survey of the relationship between the State Historical society of Wisconsin and the University of Wisconsin library.

Sixty of the 170 volumes of the Library of Congress *Catalog of Printed Cards* (printed by photo offset process) had been delivered to subscribers at the end of the year. Some 40 large libraries agreed to compare their own holdings with this printed catalog, and to report to the national union catalog titles not recorded therein. This project would probably add as many as 5,000,000 titles to the 6,000,000 listed. The second edition of the *Union List of Serials in Libraries of the United States and Canada* was published in June.

Size of Collections or Statistics of Libraries.—Nineteen libraries contained more than 1,000,000 volumes each: the Library of Congress, 6,349,157 volumes (June 30, 1941); the New York Public library, 4,449,192 volumes (comprising reference department, 2,899,790 volumes; circulation department, 1,451,249 volumes; Municipal Reference library, 98,153 volumes) (Dec. 31, 1942); Harvard university, 4,400,870 volumes (June 30, 1942); Yale university, 2,351,236 volumes (June 30, 1942); Cleveland (Ohio) Public library, 2,161,049 volumes (Dec. 31, 1942); Chicago (Ill.) Public library, 1,993,604 volumes (Dec. 31, 1942); Columbia university, 1,887,034 volumes (June 30, 1942); Boston (Mass.) Public library, 1,714,910 volumes (1942); Los Angeles (Calif.) Public library, 1,644,921 volumes (June 30, 1942); University of California, 1,568,743 volumes (comprising 1,170,738 volumes at Berkeley [June 30, 1942], and 398,000 volumes at Los Angeles [1942]); University of Chicago, 1,369,206 volumes (June 30, 1942); Cincinnati (Ohio) Public library, 1,365,348 volumes (Dec. 31, 1942); University of Illinois, 1,306,561 volumes (June 30, 1942); Brooklyn (N.Y.) Public library, 1,229,894 volumes (June 30, 1942); University of Michigan, 1,168,612 volumes (June 30, 1942); University of Minnesota, 1,221,987 volumes (June 30, 1942); Cornell university (Ithaca, N.Y.), 1,094,117 volumes (June 30, 1941); Carnegie library of Pittsburgh (Pa.), 1,085,117 volumes (Dec. 31, 1942); Detroit (Mich.) Public library, 1,054,984 volumes (June 30, 1942). Four libraries possessed more than 900,000 volumes each: St. Louis (Mo.) Public library, 997,951 volumes (April 30, 1943); Princeton university, 990,657 volumes (June 30, 1942); University of Pennsylvania, 979,919 volumes (June 30, 1942); Milwaukee (Wis.) Public library, 934,978 volumes (Dec. 31, 1942).

These figures were very uncertain standards of comparison because of differences in methods of counting, and because public libraries with many branches contained many copies of new and standard books.

Librarians.—Charles C. Williamson, director of libraries and dean of the school of library service of Columbia university since 1926, retired June 30. His great work at Columbia was the organization in 1926 of the school of library service, formed by the merger of the New York State library school at Albany and the library school of the New York Public library, the coordination of the Columbia libraries, and the planning of the new library building, South Hall, the gift of Edward S. Harkness, which was opened in 1934. The Columbia school of library service was a direct outgrowth of Williamson's significant report, *Training for Library Service*, 1923, prepared for the Carnegie corporation. Dr. Williamson was succeeded by Carl M. White, director of the library and the library school of the university of Illinois, who in turn was succeeded by Robert B. Downs, director of libraries of New York university since 1938.

Frank K. Walter, librarian of the university of Minnesota since 1921, retired June 30, and was succeeded by E. W. McDiarmid, associate professor in the university of Illinois library school. Homer Halvorson was appointed to the librarianship of Johns Hopkins university Sept. 1 upon the retirement of John C. French, librarian since 1927. John B. Kaiser, librarian of the Oakland (Calif.) Public library, became librarian of the Newark (N.J.) Free Public library on April 16 in place of Beatrice Winser, retired. H. M. Lydenberg took charge in August of the International Relations office of the American Library association in Washington. He was succeeded at the Biblioteca Benjamin Franklin in Mexico City by Prof. R. H. Gjelsness who would also direct the preparation of a union catalog of library resources in Mexico City, financed by a grant of $13,000 from the Rockefeller foundation. Eldon R. James, librarian of the Harvard law school from 1923 to 1942, was appointed law librarian of congress.

Henry O. Severance, librarian of the university of Missouri from 1907–37, died Oct. 10, 1942. In Feb., 1943, occurred the deaths of Franklin O. Poole, librarian of the association of the bar of the city of New York since 1905, and of W. N. C. Carlton, librarian of Williams college from 1922–39. John T. Vance, law librarian of congress since 1924, died on April 11. Frederick P. Keppel, president of the Carnegie corporation from 1923 to 1941, died on Sept. 8. During his administration the corporation gave generously to develop libraries and to promote education for librarianship. J. M. C. Hanson, great cataloger and organizer, long connected with the Library of Congress and the university of Chicago, died on Nov. 8 at the age of 79. Zaidee B. Vosper, editor of the A.L.A. *Booklist* since 1927, died on Nov. 16, and Lutie E. Stearns, pioneer library organizer in Wisconsin, on Dec. 27. (*See* also AMERICAN LIBRARY ASSOCIATION; CATHOLIC LIBRARY ASSOCIATION; SPECIAL LIBRARIES ASSOCIATION; etc.)

Jewett, ed., *Who's Who in Library Service*, 2nd ed. (1943). (C. F. McC.)

Great Britain.—The great demands made upon all libraries—national, public, university, school and special—increased with the passing of another year of war. The libraries of the country served the needs of a country at war, not spectacularly perhaps, but nevertheless positively and objectively. Much increased use was made, not only of recreational literature, but also of books on almost every subject in the field of knowledge. As well as readers in search of entertainment and information, the users included government departments, factories, business houses and industrial undertakings, and the services. Interest in, and appreciation of, the library service were keen and were sharpened by the publication in the autumn of *The Public Library Service, its postwar reorganization and development: proposals by the Council of the Library Association.* The publication of these far-reaching proposals, which followed detailed consideration of the *McColvin Report* issued in 1942, might well lead, it was thought, to the elimination of existing variations in standards of efficiency and the development of a well-organized, sound and generous service, in which all elements would rise to a level not known before.

Building activity was restricted, but over the country additional service points were established to meet rising demands, mainly by the conversion of shops, dwelling-houses, and schools.

The indiscriminate destruction of books collected in response to salvage appeals was halted. The keynote of the national book recovery campaign, launched at the end of 1942, was an appeal for books *as books,* not as waste paper, and the organization ensured that all books were carefully scrutinized so that those suitable for the restoration of war-damaged libraries at home and abroad, for H.M. forces, and certain other purposes, might be saved from destruction and set aside for allocation to appropriate libraries and institutions. (D. C. H. J.)

Libya: *see* ITALIAN COLONIAL EMPIRE; WORLD WAR II.

Liechtenstein. An independent, tiny European state, northeast of Switzerland, to which it is united by a customs union. Area, 65 sq.mi.; pop. (census Dec. 1941) 11,102. Chief town, Vaduz (capital, pop. 2,020). Ruler: Prince Franz Joseph II, b. 1906, was given ruling authority by his 84-year-old uncle, Prince Franz I, on March 30, 1938 and after the latter's death was crowned prince on May 29, 1939. Language, German; religion, mainly Roman Catholic; products: corn, wine, fruit, wood and marble. There is no army. Posts and telegraphs are administered by Switzerland. (S. B. F.)

Lime. Production of lime in the United States in 1942 increased slightly over 1941, to 6,103,791 short tons, another new record high. Of the total, 79% was quicklime and 21% hydrated lime; agricultural uses took 7%, building 13%, metallurgical uses 26%, chemical uses 36% and refractory uses 20%. A drop of 35% in the use of building lime was offset by increased demand in industrial uses. Canadian production totalled 884,830 short tons in 1942, an increase of 3% over 1941; 93% of the output was used in the chemical industry. Production through Aug. 1943 was 7% ahead of the same period of 1942. (G. A. Ro.)

Lindsey, Benjamin Barr (1869–1943), U.S. judge and social reformer, was born Nov. 25 in Jackson, Tenn. (For his early career see *Encyclopædia Britannica.*) Judge Lindsey devoted most of his career on the bench to reform of juvenile court procedure. He became a storm centre of criticism when he advocated "companionate marriage" as a means of eliminating undesirable factors in family life and environment which contributed to juvenile delinquency. Judge Lindsey was a superior court judge in Los Angeles, Calif., from 1934 until his death on March 26, 1943, in Los Angeles.

Linen and Flax. The demand for flax fibre and linen products in the prosecution of the war encouraged the growing of flax on almost every continent in 1943. When Russia's supply was stopped in the early days of 1940 and 1941, experimental flax growing started with renewed interest in Ireland, the United States of America, Canada, New Zealand and South Africa. In South America, Peru and Brazil made their plans. During 1943, the results of this new interest in flax growing were indicated in crop reports from widely scattered areas. In Peru, a total export of 2,238,600 short tons of fibre during the first eight months was larger than expected but farmer interest was lagging because of relatively low yield. In Chile, the cultivation of flax was slowly expanding, 125 ac. being planted in Cautin province in 1943, for the first time, although the industry itself had started there in 1903. Argentina was reported in Sept. 1943, as having found after four years of experimentation a desirable flax fibre called "Mapum M. A." which had proved resistant against epidemics or plagues and gave high yields. The two-year-old linen industry in Brazil, centred at Florianopolis, had developed extensive flax cultivation in the Itagui district and, by 1943, had more than 50 flax cleaning and processing plants in the state of Parana. Suitings, canvas and dress goods were being manufactured in increasing quantities, all of them consumed domestically, as Brazil had formerly imported approximately $5,000,000 worth of linen from Ireland and England annually before World War II. Brazilian authorities stated that close to $500,000 had been invested in the cultivation of flax alone.

The Canadian flax industry, started in Quebec, developed in 1943 in British Columbia. The first fibre flax crop was harvested in early August, and was of high quality as the flax was tank-retted rather than field-retted. The processing plant, constructed during the summer of 1943, at Vernon, B.C., at a cost of $100,000 was prepared to handle 1,400 to 1,500 ac. of flax and it was expected the production would be about 1,200 ac. in 1943. The anticipated value of the 1943 crop was $180,000 for the fibre and an additional $25,000 of flaxseed.

In the United Kingdom, 7,500 ac. of flax were raised in 1943 for scutching at Northampton where the flax processing mill was described as the largest in the British empire. The quantity was more than double that grown in all of Great Britain five years before. An innovation in the Northampton plant was the use of flax shive (waste) as a fuel. No other fuel was employed. In Denmark, incidentally, flax shive was reported in 1943 as being used in producing gas for automobiles and trucks. It was dried and pressed into briquettes for burning.

Scotland's golf courses were partially plowed up in 1943 for flax production. Half of the 18-hole courses and one-third of the 9-hole courses were utilized. In Lincolnshire, it was reported that a group of schoolboys from 7 to 16 years of age, raised two and a quarter tons of flax on their playing field.

In Eire (Ireland), the traditional home of flax and linen, three acres of flax were planted in 1943 to one in 1942. The total production in 1943 was 27,500 ac. Flax spinning also began again

in 1943 after a lapse of several years for the purpose of producing linen thread and twine.

As an encouragement to farmers growing flax and workers in flax factories, the ministry of supply in Great Britain announced in Oct. 1943, that a mobile exhibition of flax plants and fibre would tour Britain's flax growing area. Because of the war, it was stated, the total acreage of 400 in 1939 had grown to 52,000 ac. in 1943, and new factories had been equipped and opened throughout the country to handle the abundant harvests and prepare flax for the manufacture of war weapons. One of the most essential uses was in the webbing for the paratroopers' chute harness.

The importance of adequate processing machinery in securing the maximum return on the flax acreage was emphasized in the 1943 report from New Zealand where large strides were made during the first war years. In 1941–42, 15,000 ac. were planted and in 1942–43, this had increased to 22,000 ac. In May 1943, however, the New Zealand war cabinet asked for volunteers from military forces to help in preparing the crop and final results for 1943 were expected to be greatly reduced over the previous year.

In the United States of America, the experiments conducted by the Georgia School of Technology, the Georgia State Engineering Experiment station and the Tennessee Valley authority were concentrated on production of low-grade fibres suitable for use in bagging and cordage to meet wartime demand. The flax fibres were used as a substitute for jute, hemp, henequen and sisal. Whether the production costs, at a wartime emergency level in 1943, could be reduced to meet civilian peacetime competition with other fibres was considered a problem for the future, according to a report given by the research director at Atlanta, Ga., in July 1943. The current production was done on cotton mill equipment although some experiments were made unsuccessfully on jute spinning equipment.

Among other countries reporting flax production during 1943 were Morocco, with 135,600 ac. planted compared with 45,840 ac. in 1934 to 1938; Tanganyika Territory, Africa, with 16,418 ac., and Turkey which sold 800 tons of flax to the United Kingdom. In Rumania, a company was formed in 1943 with a working capital of 20,000,000 lei to supervise flax growing and the ministry of agriculture announced plans to establish 15 factory centres for flax processing.

Link, Mrs. Adeline DeSale (1892–1943), U.S. chemist, was born Jan. 4 at Omaha, Neb. She was graduated from Vassar, 1914, and received her doctorate in philosophy from the University of Chicago, 1917. She taught at Lawrence college, Appleton, Wis., 1917–21, was chemistry instructor at the University of Chicago, 1921–29, and assistant professor at the latter institution from 1929 to the time of her death. Regarded as one of the outstanding women chemists in the United States, Mrs. Link made important contributions to the study of chemical reactions. She died Nov. 20 in Chicago.

Lin Sen (1864–1943), president of China, was born at Foochow, Fukien. As a youth, he studied with U.S. missionaries and later received a traditional Chinese education at a private college. He lived in San Francisco for several years and while in the United States became a member of the Kuomintang, th[illegible] a secret society. Returning to China shortly after the revo[illegible] he won a seat in the senate of the first parliament—a [illegible]ld until 1923. He became a member of the central executive committee of the Kuomintang in 1924, was named to the state council of the national government, 1928, and was vice-president of the legislative Yuan, 1928–31. He succeeded to the presidency of that body in March 1931. Lin Sen became president of the national government in 1932, when a candidate was sought whose position in Kuomintang circles would qualify him to unify dissenting factions of the Nanking government and the Canton group. Lin Sen successfully bridged the political gap and was revered by the Chinese people as an elder statesman. Despite his high office, he withdrew from the limelight and led a life completely devoid of ostentation. His position as president was a nominal one, for Chiang Kai-shek, who relinquished the presidency in late 1931, still controlled the real reins of government. Lin Sen died in Chungking, Aug. 1.

Lions Clubs, International Association of. The International Association of Lions Clubs was founded by Melvin Jones on June 7, 1917. It is a nonpolitical, nonsectarian association of service clubs whose purpose is to recognize the needs of the community and by independent effort and through co-operation with other agencies meet those needs; also, to do everything possible to help achieve a United Nations victory. The activities of the clubs cover eight classifications: Boys and girls; citizenship and patriotism; civic improvements; community betterment; education; health and welfare; safety; sight conservation and blind. From May 1, 1942, to April 30, 1943, 66,507 separate activities were carried out.

The membership of the clubs is composed of business and professional men, and in 1943 numbered approximately 155,000. There were 4,350 clubs in 14 countries: Canada, China, Colombia, Costa Rica, Cuba, El Salvador, Guatemala, Honduras, British Honduras, Mexico, Nicaragua, Panama, the United States and Venezuela. Headquarters for the association in 1943 were at 332 S. Michigan ave., Chicago, Ill., and were directed by Secretary General Melvin Jones.

Dr. E. G. Gill of Roanoke, Va., was the 1943–44 international president. The association issues a monthly publication, the *Lion Magazine*, and the 1943 international annual meeting was held at Cleveland, Ohio. (M. Jo.)

Liquors, Alcoholic. The United States had been for many years the country of greatest production and consumption of potable spirits. Because of existing war conditions, production in practically all foreign countries was considerably curtailed, in most instances (as in Scotland) entirely suspended. Consumption in these countries also was materially reduced. Accurate records for the years after 1939—the war years—were not obtainable.

In the United States the general situation of the alcoholic liquor industry began to change toward the end of the year 1941. Production, distribution and consumption underwent in turn and in gradual acceleration quite radical and far-reaching adjustments. Most whisky distilleries began to use their available facilities for the production of industrial alcohol (grain spirits at 190 proof).

At first the opinion prevailed that this alcohol was needed solely, or at least principally, in the manufacturing process of smokeless powder. It developed, however, that the unexpectedly large requirements for high octane gasoline created a shortage of raw material for the rapidly growing synthetic rubber industry, which had to turn to alcohol as a substitute. At the same time, shipping conditions caused a practically complete interruption in the importation of molasses which had constituted the principal raw material for distillation of industrial alcohol. By government

order all distillation of grain for beverage purposes was terminated as of Oct. 8, 1942, and as rapidly as possible all beverage distilleries were converted to production of alcohol for smokeless powder, synthetic rubber, medical supplies, chemicals and many other vital war materials.

Of the total government requirement of alcohol for 1943, estimated at 525,000,000 gal., the beverage industry would have supplied 225,000,000 gal. In 1944 war necessities would require 625,000,000 gal. of alcohol, of which the beverage distillers were expected to supply 240,000,000 gal.

Whisky is normally by far the predominant alcoholic beverage in the United States.

The normal yearly production was somewhat above 120,000,000 gal. The volume of production of other alcoholic beverages was much smaller, for brandy about 30,000,000 gal., gin 5,500,000 gal., rum 3,000,000 gal. and liqueurs and divers other spirits 20,000,000 gal.

Kentucky was the state of largest production, accounting for 53% of the production, with Illinois 17%, Indiana 12%, Pennsylvania 7%, Maryland 6% and other states 5%.

No whisky was produced in the United States during 1943. On the other hand, the demand for consumption increased. Normally the annual consumption of all alcoholic liquors amounted to about 170,000,000 gal. at various proofs ranging predominantly from 86 proof to 100 proof. Of this total nearly 135,000,000 gal. was domestic whisky. At the beginning of 1943 somewhat over 400,000,000 gal. of whisky remained in the bonded storage warehouses.

Importation of Scotch whiskies (from aged stock) continued at almost the same rate as in previous years, about 8,000,000 gal.

Total importations of distilled spirits rose from 9,760,000 proof gallons in the fiscal year ending June 1942 to 15,430,000 proof gallons in the year ending June 1943, due to increased production in and importation of rum, gin and beverage alcohol from Cuba and the West Indies. (A. J. Li.)

Liquor Control.—During the year 1943, the salient feature of liquor control was the shift toward federal and, to a lesser degree, industry control, in an effort to adjust the production, distribution and sale of liquor to war conditions.

In the 17 monopoly states official rationing systems were established, and in the licence states voluntary rationing systems were the rule. The distiller rationed the distributor; the distributor, the retailer; and, in turn, the retailer rationed the consumer. Pronounced effects of the rationing induced by the shortage were threefold: a turn to rum and gin imported in rapidly increasing quantities from Cuba, Jamaica, Puerto Rico and Mexico, a new impetus to the activities of bootleggers and a considerable mortality among retailers who were unable to get merchandise.

Federal control manifested itself in 1943 in the establishment of price ceilings by the Office of Price Administration; a substantial increase in federal taxes, the exact amount not determined by Dec. 1943; and increased activity of the Alcohol Tax Unit. The OPA price ceilings affected liquor in bulk and package goods. They did not at first affect the price of individual drinks to the consumer. The distributor was allowed a 15% mark-up above cost of sales on package goods to the retailer, and the retailer was, in turn, allowed a 33⅓% mark-up on sales to the consumer. Mark-ups varied slightly in the case of wines and cordials.

Later in the year ceilings on cost of drinks to the consumer were established.

Insufficient personnel greatly hampered enforcement, although a number of suits were filed. Leading distillers, by advertising ceiling prices, endeavoured to co-operate with the OPA in seeing that the ceiling prices were observed. They also made a vigorous effort to ensure a fair distribution of merchandise by giving to all accounts a like proportion of the 1942 sales. Distillers and distributors established a voluntary quota system.

Government requirements made it extremely difficult for wine producers to get the necessary raw materials. There was also a serious shortage of tank cars.

The year 1943 saw the largest production of beer since repeal. This was in spite of the fact that the amount of malt available to breweries was restricted to 65% of the 1942 quota and a government order reserved 15% of production for the armed forces.

The shortage of liquor found the monopoly states in a less favourable situation than the licence states because of absence of reserves. This, at least temporarily, impeded the progress of the adoption of the monopoly system, which had gotten a very good start.

Two states, Washington and Oregon, in order to ensure adequate supplies of liquor, purchased distilleries in Kentucky. This action, however, was taken to secure the whisky in bulk on hand in the distilleries, and it was probable that ownership would not be permanently retained by the states.

Increase in the federal tax per gallon to whatever figure was to be decided upon ($9.00 probably) would mean a further widening in the difference of incidence between state and federal taxation.

Social problems connected with liquor, such as sales to minors, sales to drunks, closing hours, issuance, limitation and revocation of licences were under the jurisdiction of the cities and states and would probably remain so. Licence fees during 1943 underwent small change. There was a vigorous movement to increase the fees, both of retailer and distributor.

An unusual feature which developed during 1943 was the declaration of dividends, payable in liquor, by some fairly large distilleries. Such action involved a number of legal questions yet to be determined and might give rise to new methods of control.

Advertisements pointed out in 1943 that no whisky had been distilled since Oct. 8, 1942; that distillery plants were entirely devoted to the manufacture of alcohol essential to the war effort; that of an inventory of approximately 399,000,000 gal. as of Oct. 31, 1943, nearly 96,000,000 gal. disappeared through shrinkage and evaporation; that a reserve of not less than 100,000,000 gal. had to be set up for postwar requirements and that the amount available, about 203,000,000 gal., would be consumed, at the 1943 rate of demand, in less than a year if it were not that every distiller had followed a self-imposed rationing program. (*See* also BREWING AND BEER; INTOXICATION, ALCOHOLIC; WINES.)

(M. Lb.)

Literary Prizes.

The literary prizes for the year 1943 were as follows:

International.—NOBEL PRIZE FOR LITERATURE not awarded since 1939.

United States.—AMERICAN ACADEMY OF ARTS AND LETTERS AND THE NATIONAL INSTITUTE OF ARTS AND LETTERS, AWARDS IN LITERATURE, $1,000 each to Carson McCullers, José Garcia Villa, Virgil Geddes and Joseph Wittlin.

JOHN ANISFIELD AWARDS (*Saturday Review of Literature*), $1,000 each to Zora Neale Hurston for *Dust Tracks on a Road* (Lippincott), the best book concerned with racial problems in the field of creative literature; to Donald Pierson for *Negroes in Brazil* (University of Chicago), the best scholarly book in the field of race relations.

ATLANTIC MONTHLY PRESS AND LITTLE, BROWN & COMPANY, $5,000 for the most interesting non-fiction having to do with the war. No prize awarded.

A. S. BARNES & Co.—Poetry prizes to service men. First prize of $250 to John Ackerson, of the merchant marine; second prize of $100 to Corporal Harold Applebaum, U.S.A. medical detachment. There were 123 additional prizes. The 125 poems were published in book form under the title *Reveille-War Poems*.

CAREY-THOMAS AWARD (*Publishers' Weekly*) for the best example of creative publishing. A scroll to Farrar & Rinehart for their "Rivers of America" series.

CATHOLIC LITERARY AWARD (Gallery of Living Catholic Authors) for the outstanding book of Catholic interest. A scroll to John Farrow for his *Pageant of the Popes* (Sheed & Ward).

COMMONWEALTH CLUB OF CALIFORNIA.—GOLD MEDAL FOR GENERAL LITERATURE to Oscar Lewis for *I Remember Christine* (Knopf); GOLD MEDAL FOR SCHOLARSHIP AND RESEARCH to James Westfall Thompson and Bernard J. Holm for *The History of Historical Writing* (Macmillan); SILVER MEDAL FOR POETRY to H. L. Davis for *Proud Riders* (Harper); SILVER MEDAL FOR A JUVENILE to Hildegarde Hawthorne for *Long Adventure* (Appleton). SILVER MEDALS were also awarded to Hector Chevigny for *Lord of Alaska* (Viking); to Frank Waters for *The Man Who Killed the Deer* (Farrar & Rinehart); to Lillian B. Ross for *The Stranger* (Morrow).

DOUBLEDAY, DORAN—CURTIS BROWN WRITERS' CONFERENCE PRIZE, $400 for the best novel by a student at one of the writers' conferences, to Joyce Horner of the University of New Hampshire Writers' Conference, for *The Wind and the Rain.*

DODD, MEAD PRIZES.—$1,000 RED BADGE DETECTIVE STORY PRIZE to Ruth Sawtell Wallis for *Too Many Bones;* $1,000 PRIZE FOR THE BEST WAR NOVEL to John Lodwick for *Running to Paradise;* THIRD INTERCOLLEGIATE LITERARY FELLOWSHIP PRIZE to Catherine Lawrence for *One of the Masses.*

E. P. DUTTON & COMPANY.—THOMAS JEFFERSON SOUTHERN AWARD, $2,500 to Jesse Stuart for his novel, *Taps For Private Tussie.* LEWIS AND CLARK NORTHWEST CONTEST, $1,500 for the best book by a northwest author to Clyde F. Murphy for his novel, *The Glittering Hill.*

FRIENDS OF AMERICAN WRITERS AWARD to promote high standard in American writing, $750 to Kenneth L. Davis for his novel, *In the Forests of the Night* (Houghton).

GUGGENHEIM FELLOWSHIPS, 64 awards amounting to about $2,500 each. Among the winners were Muriel Rukeyser, Edward Weismiller, Jeremy Ingalls, José Garcia Villa (Filipino poet), Vladimir Nabokov (Russian-born novelist), Vladimir Pozner (French-born), Dr. Hugh MacLennan (Canadian). An award went to Signe Kirstine for a biography of Emanuel Swedenborg; to Dr. David Willson for a life of James I, King of England; to Madeleine Stern for a book on Louisa May Alcott; and to Dr. Randall Stewart for a book on Nathaniel Hawthorne. Dr. William Charvat will do a study of the profession of authorship in 19th century America; Dr. John Flanagan, a history of the literature of the middle west; Dr. Harry Levin, an analysis of the symbolist technique in American fiction.

HARPER PRIZE NOVEL AWARD, $10,000 to Martin Flavin for *Journey in the Dark.*

HARPER'S MAGAZINE PRIZE for the best first-hand war experience article submitted to *Harper's Magazine* up to July 1942, $1,000 to Bob Fairhaul and his collaborator, Richard G. Hubler, for *The Bomb Hit the Cruiser,* appearing in the Dec. 1941 issue.

O. HENRY MEMORIAL AWARD PRIZE STORIES OF 1943 (Doubleday).—First prize, $300 to Eudora Welty for "Livvie Is Back" (*Atlantic Monthly*); second prize, $200 to Dorothy Canfield for "The Knot Hole" (*Yale Review*); third prize, $100 to William Fifield for "The Fishermen of Palzcuaro" (*Story Magazine*); a first story prize, $100 to Clara Laidlaw for "The Little Black Boys" (*Atlantic Monthly*).

AVERY HOPWOOD AWARD for the best novel by a student in the University of Michigan, to Jay McCormick for *November Storm* (Doubleday).

HOUGHTON, MIFFLIN LIFE-IN-AMERICA SERIES AWARD, $2,500 to Roi Ottley for his native son's picture of life in Harlem, *New World A-Coming; Inside Black America.*

ALFRED A. KNOPF LITERARY FELLOWSHIPS, $2,500 each to Mrs. Fawn Brodie for a projected life of Joseph Smith, the founder of the Mormon Church, and to Donald W. Mitchell for his proposed history of the "new" United States navy from 1883 to the present.

LATIN-AMERICAN LITERARY PRIZE (Farrar & Rinehart and the Division of Intellectual Co-operation of the Pan American Union), $2,000 to Pierre Marcelin and Philippe Thoby-Marcelin, two cousins from Haiti, for their novel *Canapé-Vert;* $2,000 non-fiction award to Argentina Diaz Lozano of Honduras for her *Peregrinaje;* $1,000 to Fernando Alegría of Chile for her juvenile, *Lautaro.* Farrar & Rinehart will publish the books in translation.

NATIONAL EDUCATION ASSOCIATION JOURNAL, selection of the book which if read generally by the people would bring a new outlook to our republic, *A Time of Greatness* by Herbert Agar (Little, Brown).

NEW YORK DRAMA CRITICS CIRCLE AWARD, a plaque presented to Sergeant Sidney Kingsley for *The Patriots.*

NEW YORK HISTORICAL SOCIETY, gold medal for achievement in history to Dr. George C. D. Odell in recognition of his *Annals of the New York Stage,* now in its thirteenth volume.

PARENTS MAGAZINE AWARDS, medals for outstanding books for parents, to Anna W. M. Wolf for *Our Children Face War* (Houghton); to Dorothy W. Baruch for *You, Your Children and War* (Appleton-Century).

MARY ROBERTS RINEHART MYSTERY NOVEL AWARD (Farrar & Rinehart and *Collier's Weekly*), $2,000 to C. W. Grafton for *The Rat Began to Gnaw the Rope.*

SHELLEY MEMORIAL AWARD for an American poet's work as a whole, to Percy MacKaye and Robert Penn Warren, jointly.

CONSTANCE LINDSAY SKINNER AWARD (Women's National Book Association), a bronze plaque, made by Alice E. Klutas, to Mary Graham Bonner for her many excellent books for children and more particularly for *Canada and Her Story* (Knopf).

SOUTHERN WOMEN'S NATIONAL DEMOCRATIC ORGANIZATION IN NEW YORK for the most distinguished book by a southern writer, to Douglas Southall Freeman for his *Lee's Lieutenants* (Scribner).

UNIVERSITY OF MINNESOTA FELLOWSHIPS, newly established through a grant from the Rockefeller foundation, for written interpretations of life in the central northwest. Among the winners of the first series of awards were Vera Kelsey, Meridel Le Sueue, Florence and Francis Lee Jacques.

Great Britain.—JAMES TAIT BLACK MEMORIAL PRIZES to Arthur Waley for his translation of the Chinese novel, *Monkey,* by Wu Ch'êng-ên (John Day); to Arthur Ponsonby for his biography, *Henry Ponsonby: Queen Victoria's Private Secretary* (Macmillan).

Children's Books.—CALDECOTT MEDAL FOR A PICTURE BOOK to Virginia Lee Burton for her illustrations in her own book, *The Little House* (Houghton).

CARNEGIE MEDAL (British) to D. J. Watkins-Pitchford for *The Little Grey Men.*

DOWNEY AWARD for the finest American children's book written in the Catholic tradition, to Covelle Newcomb for *The Red Hat* (Longmans), a biography of Cardinal Newman.

JULIA ELLSWORTH FORD FOUNDATION AWARD, $1,250 to Gladys Malvern for her *Valiant Minstrel: The Story of Harry Lauder* (Messner).

HERALD TRIBUNE CHILDREN'S SPRING BOOK FESTIVAL PRIZES, three awards of $200 each to Hugh Troy for *Five Golden Wrens* (Oxford), the best book for younger children; to Laura Ingalls Wilder for *These Happy Golden Years* (Harper), the best book for middle-aged children; to Elizabeth Yates for *Patterns On The Wall* (Knopf), the best book for older children.

JUNIOR SCHOLASTIC MAGAZINE GOLD SEAL for a juvenile book considered to be an enriching experience in the lives of young Americans, to Gregor Felsen for *Submarine Sailor* (Dutton).

JOHN NEWBERY MEDAL (American Library Association) to Elizabeth Janet Gray for *Adam of the Road* (Viking).

YOUNG READER'S CHOICE AWARD (Pacific Northwest Library Association) to Eric Knight for *Lassie Come-Home* (Winston), selected by vote of grade school children as the book which they enjoyed most in 1943.

Lithium Minerals.

Lepidolite, spodumene and amblygonite are produced mainly in South Dakota, with some smaller output in North Carolina, and lithium-sodium phosphate is recovered from the brines of Searles lake, Calif. The combination of the output of minerals with a comparatively low lithium content with the much richer salt gives a figure which does not have a great deal of significance and the value is a better measure of relative output. The total shipments of minerals and salts in 1942 was 5,405 short tons ($243,516), as compared with 3,832 tons ($115,718) in 1941. The increase of 41% in weight as against 110% in value would indicate a larger proportion of salts in the 1942 total. (G. A. Ro.)

Lithuania.

A Baltic country of northeastern Europe, N. of Poland; in 1941 it became a part of Germany's "Ostland." Area, 22,959 sq.mi. (1940); pop. (Jan. 1, 1940) 2,879,070. Chief cities of Lithuania are: Vilnius (Vilna, capital, 207,750); Kaunas (actual seat of administration, 152,365). Religion, predominantly Roman Catholic (85%). Ruler in 1943 was Commissioner General Adrian von Renteln, who was responsible to Reichscommissar Hinrich Lohse of the Ostland.

History.—The kaleidoscopic changes of centuries of Lithuanian political history were epitomized in 1940–43: Under the control of the U.S.S.R. from June 15, 1940, to June 23, 1941, the Lithuanians then staged a revolution and declared independence; the German armies reached Kaunas on June 24, 1941, but allowed the independent Lithuanian government to function for only about seven weeks; on Aug. 5 this government resigned and the nazi control was complete.

Under the German occupation the promises made by the reichscommissar of "order . . . construction and civilization . . . a supervised economy" had scarcely been fulfilled at the end of 1943. Private property was only partly restored, and in a proclamation of March 17, 1943, Hinrich Lohse definitely declared that only those who participated in the "War against Bolshevism" would be allowed to regain property. The same order closed the universities, avowedly because of the anti-nazi activities of the Lithuanian intellectuals. The library "revision" carried out by the nazis in Lithuania as in Poland and the other Baltic states deprived two Kaunas libraries of 10,000 and 17,000 volumes respectively; the library of the University of Vytautas the Great

of 23,000 volumes, and the library of the Academy of Sciences in Vilnius of over 40,000 volumes. Reports indicated a systematic annihilation of the educated class by arrest or execution. At the beginning of 1943 there were some 100,000 Lithuanian labourers in Germany, and new demands for troops as well were made in the spring of 1943. Large numbers of men and boys refused to register and took to the woods where they organized as guerrilla bands. Open revolt was reported in March, and Heinrich Himmler himself went to Lithuania to try to quell the spreading violence.

Lithuanian representatives in the United Nations placed their hopes for national rejuvenation in the Atlantic Charter and the policies of the democratic countries. Another government-in-exile functioned in Moscow. The political future of the country remained uncertain, with no specific statement emanating from the United Nations, with the soviet union seemingly assuming that Russian occupation must be re-established, and with the Lithuanians themselves rebellious but powerless to express their will in any decisive fashion. There was the possibility that if the Germans were forced to withdraw they might declare Lithuania independent as a parting gesture. Lithuanian units with the Red army were reported to have destroyed 13,000 Germans, and to be fighting heroically. Toward the end of 1943 the battle lines came close to the Lithuanian frontier with the Russian drive past Vitebsk.

Statistics of education, finance and economic conditions were not issued after the soviet occupation in 1940, and the latest available figures at the end of 1943 pertained mostly to 1938 and 1939.

Education.—In 1938–39 there were 2,335 private schools with 298,429 scholars, and 83 secondary schools and gymnasia with 19,539 scholars. Part of the university at Kaunas was moved back to Vilna Jan. 15, 1940.

Finance.—The monetary unit is the lita (=16.1 U.S. cents at par, established in 1922 as one-tenth the U.S. gold dollar). At the end of 1939 the foreign debt was 68,915,300 litas, and the domestic debt of the government was 65,231,200 litas. In 1939 the budget estimate of the government balanced at 341,785,274 litas.

Trade and Communication.—In 1938 imports amounted to 223,686,000 litas, and exports to 233,200,000 litas. Chief articles of import were cotton yarn and thread, woollen yarn and thread, cotton fabrics, woollen fabrics, coal and fertilizers. Chief articles of export were meat, butter, flax fibre, pigs and eggs. Almost 40% of the exports went to Great Britain, 27% to Germany, 5.7% to the U.S.S.R. Imports came 31% from Britain, 24.5% from Germany, 6.7% from the U.S.S.R. In 1938 telephones numbered 26,591; radio sets 53,667; broadcasting stations 2.

Agriculture.—Almost 77% of the population is engaged in agriculture, and 49% of the land is arable. Chief products in 1939 and their output in short tons were as follows: rye 726,636; wheat 282,850; barley 282,740; oats 450,841; potatoes 2,290,469; flax fibre 31,416; butter 21,890. The 1939 estimate of livestock was: horses 521,000; cattle 1,004,000; sheep 1,224,000; pigs 1,224,000; poultry 5,130,920.

Manufacturing.—In 1938 some 1,441 industrial establishments employed 40,818 people. Meat and fish products were valued at 44,919,000 litas; manufactured timber 12,532,000 litas; tissues and yarns 28,131,000 litas; machines, etc. 13,215,000 litas; leather goods 14,374,000 litas. Lithuania increased industrial production from an index of 100 in 1929 to 354 in 1939. Total industrial production of 1939 was 405,749,000 litas.

(F. D. S.)

Litvinov, Maxim Maximovich (1876–), Russian politician, was born July 17 in Bialystok, Russia. He joined the Social-Democratic party in 1898 and supported Lenin and the bolshevists in the factional clash of 1904. After the revolution (1917) he was the party's plenipotentiary in London, where he was imprisoned as a hostage. He took part in conferences at Genoa and the Hague, led soviet delegations at the 1927, 1928 and 1929 sessions of the preliminary disarmament commissions of the League of Nations and in 1928 signed the Kellogg pact for the U.S.S.R. He was made commissar for foreign affairs in 1930 and championed collective security at League of Nations sessions. He was suddenly dropped from his foreign office post May 3, 1939, in the midst of negotiations with Britain and France for a general mutual assistance pact; the mystery of his ouster was solved in Aug. 1939 when Germany concluded a nonaggression pact with the U.S.S.R. He was expelled from the communist party Feb. 21, 1941, but returned to favour after the nazis attacked the U.S.S.R., June 22, 1941, and was appointed soviet ambassador to the U.S. Nov. 6, 1941.

On Aug. 21, 1943, Litvinov was replaced as ambassador to the United States by Andrei Gromyko. The suddenness of this move, coupled with the removal of Ivan Maisky from his post as ambassador at London, led many observers to believe that Stalin was dissatisfied with Anglo-U.S. failure to open a second front. Credence was lent to this view because of the customary soviet practice of removing envoys from countries whose policies did not meet with Kremlin approval.

Livestock. The total number of all livestock on United States farms in 1943 as estimated by the U.S. department of agriculture exceeded all previous records, the increase in hogs and cattle more than offsetting the decreases in sheep, horses and mules. When the large increases made during the year in hogs and poultry were included, the total annual supply reached an entirely new record high. In terms of animal units the total on Jan. 1, 1943, was 5% larger than a year earlier and 11% above the ten-year average. When these numbers are converted to grain-consuming animal units, the increase during 1942 was about 11%

AUCTION OF CATTLE at Ellicott City, Md., Sept. 16, 1943, which realized a total of $383,700 for 230 animals—a U.S. livestock record

Numbers of Livestock on U.S. Farms, 1943, 1942 and 10-Year Average

	1943 (Jan.)	1942 (Jan.)	1932–41 av.
Horses	9,678,000	9,907,000	11,409,000
Mules	3,712,000	3,813,000	4,542,000
Cattle	78,170,000	75,162,000	68,418,000
Milk cows	26,046,000	26,398,000	25,316,000
Sheep	55,089,000	56,735,000	52,386,000
Hogs	73,660,000	60,377,000	51,508,000
Chickens	540,107,000	474,910,000	420,201,000
Turkeys	6,549,000	7,623,000	6,510,000

and in terms of hay and pasture units, 2%. This record number was to a large extent the result of a large supply of grain and hay after five years of good crops. The production of feed grains and hay in 1942 was high and the carry-over stocks were large, with the result that on Jan. 1, 1943, farm feed grain supplies were the largest in 20 years and 3% above the five-year average, while hay was 6% above the same average. The increase in hogs was the largest, amounting to 22% in 1942. The total number of cattle was at a new high record, over 3,000,000 head more than the previous record. Numbers of sheep decreased about 3% after having advanced continuously for five years. The number of horses and mules continued the decline which began in 1915 with the beginning of the use of the power tractor. The numbers of poultry increased in 1942 and continued at a rapid rate through 1943. (*See* also AGRICULTURE; CATTLE; HOGS; HORSES; MEAT; POULTRY; SHEEP.) (J. C. Ms.)

Livestock Shows: *see* SHOWS.

Loftus, Marie Cecilia ("CISSIE") (1876–1943), British actress, was born Oct. 22 in Glasgow, Scotland, the daughter of vaudeville actors. She grew up backstage, helped as her mother's off-stage maid, and at the age of 16 was a sensation on the London stage with her impersonations. Her dramatic talent won quick fame, and for 50 years she was an outstanding figure in New York and London theatrical circles. She joined Mme. Modjeska's company in 1900, played leading woman to E. H. Sothern and succeeded Ellen Terry in Sir Henry Irving's company. In the United States she appeared with Sothern in *Hamlet* and took the feminine lead in *If I Were King,* written by her first husband, Justin H. McCarthy. She scored hits in such diversified fields as James Barrie's *Peter Pan* and in the Ziegfeld Follies. Miss Loftus made her talking picture debut in *East Lynne,* 1931, and subsequently appeared in *The Old Maid, The Blue Bird, It's a Date* and *Lucky Partners.* She died in New York city, July 12.

London. London's wartime life appeared to change little during 1943 despite the welcome ubiquity of U.S. soldiers and airmen and such minor new discomforts as wooden slatted utility seats in new buses. The year's outstanding event was the publication of the County of London plan which concerned London's future.

Prepared for the London County council at the request of the government by J. H. Forshaw, the L.C.C. architect, in consultation with Prof. Patrick Abercrombie, the plan was the first comprehensive design for London since Wren's scheme after the great fire. It outlined developments for the succeeding 50 years. Working on a fundamental "neighbourhood" principle, the town planners proposed to enlarge the community life of the 28 London boroughs by dividing them into groups of units of from 6,000 to 10,000 people each. A unit would have its own schools, shops, public buildings, amusements, residential areas and industrial districts. Each unit would be as self-contained as possible for all ordinary purposes. Westminster would remain the pivot of national and religious life. Bloomsbury would form the University "precinct." The south bank of the Thames from Westminster bridge to London bridge would be "a river pleasaunce" with open

A VARIETY OF USES was made of London's bombed buildings in 1943. Here a band is giving a public concert in the foundation of a demolished structure

spaces for recreation and a cultural centre for art and music.

The plan adapted itself to existing London arterial roads by having two ring roads for the county area: an inner ring encircling the imperial, cultural and commercial core of London and linking the main line railway terminals; and an outer ring linking docks, marshalling (freight) yards and industrial centres. Nine new arterial roads radiating from Westminster were designed to cross the ring roads while avoiding the "neighbourhoods."

On the plan's basis of 4 ac. to every 1,000 people, London county's open spaces would grow from 7,888 ac. to 13,316 ac. To this end roughly two-thirds of the L.C.C.'s intended new housing would have to be flats and the rest chiefly terraced houses. It was calculated that in 20 years' time the existing county population of 4,000,000 would fall to 3,400,000, chiefly through removals. This estimate permitted the plan to fix population densities from a maximum of 200 per residential acre in the west central district to 100 in the outer districts.

The published scheme was conditioned by a larger London regional design for the 9,000,000 population of greater London under preparation by Professor Abercrombie. It did not include the "square mile" of the city of London, whose corporation was devising its own plan to recreate its heavily bombed areas. Much legislation would need to be passed by parliament before any of these plans could be carried out, but it was anticipated that reconstruction of some of the worst-bombed areas of east London could begin within the ambit of the county plan immediately after the war ended. The plan could make no estimate of cost. It was later calculated by the Finance committee of the L.C.C. that the 100,000 new residences needed would cost around £80,000,000.

Meanwhile Waterloo bridge, opened after five years' construction costing £1,250,000, stood as a symbol of a new London. Designed by Sir Giles Scott and five engineers, it has five spans of 240-ft. clear compared with nine spans of 120-ft. in Rennie's bridge of 1817 which it replaced.

London was practically immune from heavy air raids during 1943. In the autumn there were several series of brief raids by high-speed enemy aircraft which indiscriminately dropped bombs that nearly all fell in the suburbs, causing little damage to property and, with a few exceptions, little loss of life. The immunity and Londoners' cool attitude towards the raids allowed most tube shelters to be closed temporarily. In March, during a raid, 173 people were crushed and suffocated to death on a flight of stairs leading to a tube shelter. The tragedy was believed to have been caused when a woman with a bundle and a baby tripped, but the report of the official inquiry was not published.

London's evacuated population continued to return to the county throughout the year. The number of children in L.C.C. schools grew to over 240,000, leaving roughly 100,000 in the county. The latter included 62,000 children with whom the L.C.C. education department had lost touch, and special machinery was set up to trace the "lost" evacuees.

A report by the L.C.C. Chief Inspector of Education in May disclosed a serious decline in the educational standard of senior children. Of 2,000 children aged 13 years, 7 months, tested in English, arithmetic, history and geography, about half were found to be below standard. In cases of children moved from place to place since the war began, retardation was said to be between 6 months and 12 months. Following the report, special tuition was started for backward scholars.

There was no reported sign of physical deterioration among L.C.C. school children.

The health of London adults was considered satisfactory in the light of wartime circumstances. Deaths from all causes—to give the latest published figures available in 1943—dropped from 43,577 in 1941 to 36,057 and births increased from 33,944 to 40,654 in the same period. The customary population statistics were not available.

The L.C.C. began its 1943–44 year with a surplus of £6,000,000 and the county rate, which is distinct from borough rates, remained at 6/9½ in the £. A gross expenditure of roughly £42,450,000 was estimated. It included a reduction in the cost of civil defense from £18,000,000 to an estimated £12,000,000.

London's traffic became noticeably light during 1943 because of gasoline restrictions. Privately-run cars almost disappeared. Bus mileage increased to a quarter more than the prewar figure, largely through war workers' journeys. Women replacements of London's male bus conductors increased to 90%. When more buses were provided for London, it was difficult to find conductoresses for them because of other calls on women for war work.

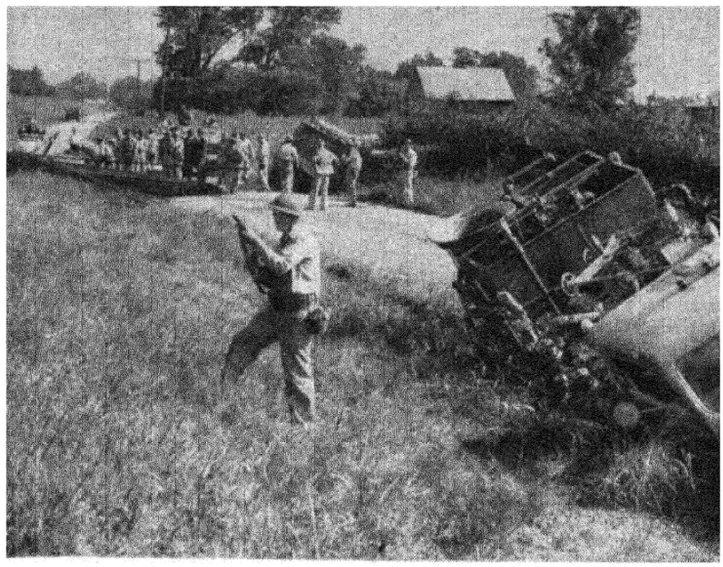
During a "Wings for Victory" week, London set out to raise £150,000,000 for official war investment. The final figure of contributions of all sources, from commercial corporations to private citizens, was £162,015,869. (P. Bn.)

London University. During 1943 the emphasis shifted from wartime emergency planning to planning for the postwar period. Several more schools made arrangements to return to London at the end of the session. The number of internal students was 9,800, an increase of 650, and the number of external students was 13,061, the largest number ever registered. The educational work for prisoners of war was greatly extended, and the extra-mural department which was doing valuable work for the armed forces initiated special courses dealing with the life and culture of the Allied nations. Most of the vacant chairs and readerships remained unfilled because of war conditions. Harold Claughton was appointed principal of the university, Dr. D. R. Pye became provost of University college and Dr. R. V. Southwell rector of Imperial college. The honorary degree of LL.D. was conferred on President Roosevelt at Ottawa by the governor-general of Canada as chancellor of the university. The university contingent of the Senior Training corps was restarted in London.

Los Angeles. Fifth largest U.S. city, with a population of 1,504,277 in 1940, Los Angeles, Calif., ended 1943 with an (Los Angeles Chamber of Commerce) estimated population of 1,775,000. Mayor (Dec. 31, 1943) Fletcher Bowron.

The Los Angeles metropolitan area was rated (by the U.S. bureau of the census) as the nation's third most populous in 1943 and its industrial area, with total government war contracts, according to the War Production board, aggregating more than those of any other industrial area of the U.S. in value, excepting only that of Detroit, Mich., approached peak production of aircraft, parts, ships, tanks, guns, ammunition and various other war equipment and supplies.

In spite of the fact that the number of factory workers in the industrial area increased from a prewar total of 136,000 to approximately 500,000—and the subsequent overcrowding of housing facilities by rapidly-expanding population—Los Angeles county in 1943 escaped being classified as a "boom area" by the National Industrial Conference board.



Production began during the fall of 1943 in Henry J. Kaiser's $83,000,000 Fontana steel plant, and synthetic rubber was added to the area's aluminum production, thus creating three basic industries to serve the entire western United States.

Four major tire factories, two synthetic rubber factories, four plants producing synthetic rubber ingredients and 41 other establishments turning out still other rubber products were located in Los Angeles county.

Not only were extra hours devoted by civic and industrial leaders to the problem of finding an increased labour supply to achieve and continue peak war production in 1943, but they also found time to give thought to postwar planning, with the result that many war plant operators announced blueprints ready for almost immediate conversion to peacetime production.

The end of 1943 found completion of regional organization of the Metropolitan Opera guild, with offices for southern California located in Los Angeles, and the Philharmonic orchestra had as permanent musical director a former member, Alfred Wallenstein.

Assessed valuation for the city in the fiscal year 1943–44 was $1,376,569,775. The city tax rate was $5.1931 per $100. The budget for 1943–44 was $46,447,872, exclusive of the water and power and harbour departments. Bonded indebtedness, as of Nov. 30, 1943, was $118,676,462.10. (F. P. Dy.)

LOUISIANA STATE GUARDSMEN were called out Oct. 9, 1943, to seat a sheriff in Plaquemines parish when the sheriff's foes declared that his appointment was illegal. The guardsmen are shown here removing a barricade on the highway

Louisiana.

One of the west south central states of the United States of America, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,177 sq.mi. are land. Pop. (1940) 2,363,880, of which 1,383,441 or 58.5% were rural and 980,439 or 41.5% urban; 64% native whites, 34.3% Negroes and 1.7% foreign born. Capital, Baton Rouge (34,719). Other important cities: New Orleans (494,537), Shreveport (98,167), Monroe (28,309), Alexandria (27,066), Lake Charles (21,207).

History.—The legislature did not meet in 1943. The new state civil service system went into operation on Jan. 1, after the supreme court had upheld its constitutionality. A program of economy and efficiency in state affairs was continued, in spite of political opposition in the form of several court actions brought to test the constitutionality of certain reform statutes or the legality of some administrative policies.

The national war effort caused increased industrial activity in Louisiana in 1943. Established industries engaged in war production were expanded by the addition of new units, and several new defense plants were put into operation. Housing facilities were greatly expanded near the chief industrial centres and the numerous military training camps.

State officers in 1943 were Sam Houston Jones, governor; Mark M. Mouton, lieutenant governor; James A. Gremillion, secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Eugene Stanley, attorney general.

Education.—In 1943 the 895 public schools for whites enrolled 200,546 elementary and 79,475 high school pupils and employed 10,255 teachers; the 107 public schools for Negroes enrolled 26,860 elementary and 17,453 high school pupils and employed 1,220 teachers. The 172 private schools for whites enrolled 39,331 elementary and 9,676 high school pupils and employed 1,603 teachers; the 15 private schools for Negroes enrolled 4,556 elementary and 2,063 high school pupils and employed 180 teachers.

State expenditures exceeded $18,000,000 (exclusive of local funds) for public elementary and secondary schools and $8,000,000 for state-supported colleges and universities. Wartime conditions caused a decrease in enrolments in all Louisiana colleges.

Public Welfare, Charities, Correction.—Louisiana expended about $16,000,000 in 1943 in paying old-age benefits to 37,000 persons, aiding dependent children in 13,000 families, assisting 1,400 blind persons and extending general relief to 4,600 unemployables. The labour shortage and the high wages prevailing in industry and agriculture greatly reduced the expenditures for general relief and unemployment insurance as compared with 1942.

The state maintained the following institutions in 1943: charity hospitals at New Orleans, Shreveport, Lafayette, Monroe, Pineville, Independence and Bogalusa; insane hospitals at Jackson and Pineville; a tuberculosis sanitarium at Greenwell Springs; schools for the blind and deaf at Baton Rouge; training school for the feeble-minded at Alexandria; soldiers' home at New Orleans. There were also numerous private and endowed hospitals and orphanages in operation. The state maintained two prison farms for its 3,300 adult offenders and separate training institutes for about 300 juvenile delinquents. Maintenance expenditures for charitable and correctional institutions exceeded $9,500,000 in 1943, while an additional $1,300,000 was expended on permanent improvements at the charitable institutions.

Communication.—In 1943 Louisiana had 18,200 mi. of public highways, 14,410 of which were state-maintained, 10,140 being gravelled and 4,270 paved; the expenditure for highways was less than $12,000,000, because of shortage of materials for new construction. There were 4,400 mi. of railways and 4,800 mi. of navigable waterways. New Orleans, Baton Rouge and Lake Charles are ports for ocean-going commerce, with combined tonnage of 7,515,000 foreign and 11,556,000 coastwise in 1940. There were 26 airports for land planes and 11 seaplane bases and anchorages in 1943. There were nearly 265,000 telephones in service in Louisiana in 1943.

Banking and Finance.—Louisiana had 30 national banks in 1943, with deposits of $780,000,000 and resources of $825,000,000; and 116 state banks, with deposits of $330,000,000 and resources of $355,000,000. There were 67 savings and loan associations, with total resources of about $80,000,000. State budget for fiscal year 1942–43: receipts $106,431,399; expenditures $85,391,172. Gross state debt $170,000,000; net debt $165,000,000.

Agriculture.—Total value of agricultural production in 1943 was $244,000,000, compared with $190,000,000 in 1942; total acreage harvested was 4,200,000, compared with 4,124,000 in 1942. Cash income from crops and livestock was $275,000,000 in 1943, compared with $225,000,000 in 1942; from government

Table I.—*Leading Agricultural Products of Louisiana, 1943 and 1942*

Crop	1943	1942
Cotton, bales	735,000	593,000
Corn, bu.	22,786,000	24,412,000
Rice, bu.	23,978,000	25,758,000
Sugar cane, tons	5,700,000	4,935,000
Sweet potatoes, bu.	8,330,000	5,808,000
Irish potatoes, bu.	3,599,000	2,520,000
Oats, bu.	3,406,000	3,150,000
Hay, tons	375,000	393,000
Pecans, lbs.	8,640,000	6,400,000
Peanuts, lbs.	9,000,000	8,840,000
Peaches, bu.	176,000	335,000
Pears, bu.	78,000	230,000
Oranges, boxes	260,000	340,000

payments, $12,000,000, compared with $13,200,000 in 1942. War conditions stimulated agricultural production in Louisiana in 1943. Crop yields were not unusual, but the weather was generally favourable for agriculture, and the prices for agricultural commodities were somewhat higher than in 1942.

Manufacturing.—The production of chemicals, refined petroleum, synthetic rubber, lumber and cottonseed derivatives was greatly increased by the urgent demand for war supplies, and a few other types of manufactures showed a smaller increase in 1943. Nearly 2,000 industrial establishments, employing 150,000 workers and paying $200,000,000 in wages, produced finished products worth $1,155,000,000 in 1943, as compared with $990,000,000 in 1942.

Mineral Production.—War demands stimulated mineral production in Louisiana in 1943, and the total value of the minerals produced was estimated at $260,000,000, as compared with $250,000,000 in 1942. Some small new oil fields were opened during the year.

Table II.—*Principal Mineral Products of Louisiana, 1943 and 1942*

Mineral	1943	1942
Petroleum (bbl.)	127,135,000	122,432,000
Natural gas (M. cu.ft.)	455,000,000	475,000,000
Natural gasoline (bbl.)	2,418,500	2,300,000
Sulphur (long tons)	640,000	600,000
Salt (short tons)	830,000	700,000

(W.Pr.)

Love, Nancy Harkness (1914–), U.S. commander of the Women's Auxiliary Ferrying Squadron (WAFS), was born Feb. 14 in Houghton, Mich. She learned to fly when she was 16 years old and while a student at Vassar, 1931–34, qualified for a commercial pilot's licence. She was air marking pilot for the U.S. bureau of air commerce, 1935–37. Later she became a test pilot, and in 1941 she joined her husband's aviation company as sales director. On Sept. 11, 1942, Sec'y. of War Stimson announced plans to establish a unit of women fliers to ferry army planes from factories to airfields, thus relieving male pilots for other duties. The unit, known as the Women's Auxiliary Ferrying Squadron (WAFS), was put under command of Mrs. Love. During the summer of 1943 the WAFS were incorporated in the Women's Airforce Service Pilots (WASP), and Mrs. Love was appointed to the staff of the commanding officer of the ferrying division, air transport command.

Lowden, Frank Orren (1861–1943), U.S. politician, was born Jan. 26 at Sunrise City, Minn. (For his early career, see *Encyclopædia Britannica.*) Lowden, known as a "favourite son" in midwest Republican circles, was regarded as the outstanding G.O.P. candidate for president at the Chicago convention in 1920, but lost to Warren G. Harding, a "dark horse" after an 11th hour switch in votes. He declined the nomination as vice-president and running mate to Calvin Coolidge in 1924 and withdrew as Republican presidential candidate in 1928 when his farm plank for the party platform was rejected. He later retired to his Sinnissippi farm in Oregon, Ill. He died in Tucson, Ariz., March 20.

Lowell, Abbott Lawrence (1856–1943), U.S. educator, was born Dec. 13 in Boston. Brother of Amy Lowell, poetess, and Percival Lowell, astronomer, he was president of Harvard university from 1909 to 1933. He donated $1,000,000 for the establishment of a Harvard Society of Fellows to give financial assistance to post-graduate students. After retiring in 1933 he became head of the Motion Picture Research council. His later books include *Conflicts of Principle* (1932), *At War with Academic Traditions* (1934), *Biography of Percival Lowell* (1935) and *What a College President Has Learned* (1938). He died at his home in Boston, Jan. 6. (See *Encyclopædia Britannica.*)

Luce, Clare Boothe (1903–), U.S. playwright and member of congress, was born in New York city April 10. Graduated in 1917 from St. Mary's school at Garden City, Long Island, N.Y., and in 1919 from Miss Mason's Castle school at Tarrytown-on-the-Hudson, she later received an honorary degree from Colby college. She was associate editor of *Vogue* in 1930, and associate editor and managing editor of *Vanity Fair* from 1930 to 1934. In 1935 she married Henry R. Luce, magazine publisher. As Republican nominee for congress from the 4th district of Connecticut (Greenwich) in 1942, she conducted a colourful campaign, and was elected Nov. 3. Mrs. Luce was appointed in Jan. 1943 to the house military affairs committee and on Feb. 10, she made nation-wide headlines in referring to Vice-President Wallace's views on global thinking as "globaloney." She lashed the administration's foreign policy, declaring that it was tied to the coattails of the British foreign office, expressed concern over the "political muddle" on the home front, assailed Churchill for regarding freedom as a "white man's monopoly" and called for liberation of India. She praised the Moscow accords but denied that her approval was inconsistent with her stated views on "globaloney." She is the author of *Stuffed Shirts* (1933) and *Europe in the Spring* (1940), and such plays as *The Women* (1937), *Kiss the Boys Goodbye* (1938) and *Margin for Error* (1939).

Lumber. Lumber continued as one of the most important and critical materials on the home front as well as for the conduct of the war. In fact it became so critical for particular uses such as shipbuilding, boxes and crating materials and aeroplane stock that special campaigns were conducted to increase production at the various mills. Labour continued to be the bottleneck of the problem. Large numbers of men were taken by the draft or attracted to other and higher paying war industries so that many logging and sawmill operations were seriously curtailed through the lack of available manpower, and in some of these sawmills women were used. Formerly, women had practically never been used in the sawmills or in the woods operations because of the hazardous and heavy work involved. Consumption for 1943 in the U.S. was about 36,000,000,000 bd.ft., of which approximately 29,500,000,000 bd.ft. was of softwoods and 6,500,000,000 bd.ft. of hardwoods.

In spite of priority ratings issued by the War Production board and increased ceiling prices for lumber as issued by the Office of Price Administration in Washington, the production of lumber did not meet all of the requirements of the army, navy, and other armed services as well as industrial requirements for war purposes.

Difficulties in securing sufficient machinery, tires, trucks, and other necessary equipment for the operation of logging work in the woods as well as in the operation of sawmills were considerably relieved. The production of Douglas fir on the north Pacific coast was curtailed due to the loss of employees to both the shipbuilding and aircraft factories. However, the industry there made an excellent record in meeting the requirements as far as possible. The increased demand for lumber for landing barges, patrol boats, mine sweepers, mine layers, submarine chasers, salvage tugs and containers increased vastly, particularly in the Douglas fir and southern pine regions. Southern pine continued as the most important species produced, followed in order of importance by Douglas fir, ponderosa pine, oak, white pine and hemlock.

A large number of small sawmills increased their production or

started operations after being dormant throughout the recent economic depression.

The largest, most symmetrical, and the highest value logs produced in the Douglas fir forests continued to be in great demand for the manufacture of veneers used in making plywood. The production of plywood from hardwoods and southern pine was increased considerably. In some parts of the country the selection of the best logs for plywood curtailed the volume of logs available for lumber production. The increasing and critical demands for pulpwood, particularly in the northeast and in Canada, also affected somewhat the production of lumber. In some cases, prices for lumber, especially for some species like spruce, were so attractive that considerable volume of this species normally used for the manufacture of paper was used for the production of various kinds of lumber.

Dunnage was in especially great demand for the stowing and protection of various kinds of war cargoes shipped to foreign shores. In fact, the demand for boxes and other forms of containers used for the shipment of munitions increased so greatly that upper grades of lumber not normally used for these purposes were widely shipped and utilized under the extreme emergency situations created by the war. (N. C. B.)

British Empire.—Notwithstanding the unprecedented fellings in the forests and woodlands of Great Britain in the earlier war years, production of home-grown timber in 1943 showed no diminution. Actually production figures were expected to establish a new high record. Statistics were not made public. By the end of 1942 it was estimated that home-grown production was meeting about 75% of Great Britain's requirements. In the later months of 1943 Britain was producing about three-eighths of its sawn softwood requirements, three-fourths to four-fifths of its sawn hardwoods, and practically all its mining timbers.

The 1942 production targets set by the government home timber production department were exceeded by the trade mills, military forestry units, and the departmental operations. Results were: sawn hardwoods, 126% of target figures; sawn softwoods 107%; sawn mining timbers 114%; round mining timber 99%. For 1943 the same targets were set, except that in round mining timber an expansion of 10 to 15% was called for. Trend of production during 1943 is shown by the following midyear (1943) results: sawn hardwoods 132% of target; sawn softwoods 110%; sawn mining timber 113%; round mining timber 101%. Britain proved to have much more growing timber than was commonly supposed, especially hardwoods. In licensing timber for use many consumers were directed to use hardwoods for work that would normally use softwoods.

To Britain's home production were added in 1943 greatly valued imports from the United States, Canada, Brazil, British Guiana and other countries. During the year an official U.S. Timber mission visited Great Britain to discuss matters of common interest in connection with the control and production of timber and economy in use. Canada's production, estimated at 4,000,000,000 bd.ft. kept up well, despite great manpower difficulties. Shipments to Great Britain from the United States and Canada helped greatly the maintenance of national stocks in Great Britain to meet all vital war necessities. How great these were may be gathered from a statement by the British timber controller that civilian consumption had been brought down to between 10 and 15% of prewar volume.

Postwar housing needs in Britain were much discussed during 1943, and increasing attention was given to the possibility of providing unit-built or prefabricated dwellings for which timber is admirably suitable.

Europe.—From the European timber-producing countries—except from Sweden—little information was available, though it was known that in countries overrun by the Germans the invaders were pursuing ruthless felling in the forests. Sweden, neutral in the war, was still cut off from her main markets. Germany was her only large customer; quotas for Denmark, the Netherlands and Belgium were very small in 1943. Sweden's exports had fallen from about 750,000 standards of sawn and planed goods, including boxboards, before the war, to 365,000 standards in 1942—the lowest total for 75 years. In 1943 Sweden's exports up to the end of August were approximately 190,000 standards. A greatly increased consumption of timber in Sweden itself provided some compensating balance for the industry. (*See* also FORESTS.) (N. F.)

Lutherans. The year 1943 was another long year of suffering and endurance for the millions of Lutherans in the northern and central countries of Europe with almost no communication with Lutherans in other parts of the world.

In America the Lutheran churches recorded very substantial gains in membership and in material support. In addition to increases in support of the regular work of missions, education and charity, the Lutherans in America contributed more than $1,750,000 for work among the men in the armed forces of the country.

The Board of Foreign Missions of the United Lutheran Church in America organized a school for its missionaries on furlough, especially those on forced furlough from Japan and China, at which there was a basic study, by the missionaries and members of the board, of the whole missionary enterprise, out of which a plan was developed to project similar schools into all congregations.

A notable event was the most inclusive mid-summer conference of Lutheran theological teachers ever held in America, which convened at Rock Island, Ill.

Another event of wide interest was the purchase of the residence of the late John Pierpont Morgan, on Madison avenue, New York city, for the future national headquarters of the United Lutheran Church in America. (W. H. G.)

Lutz, Frank Eugene (1879–1943), U.S. entomologist, was born Sept. 15 in Bloomsburg, Pa. He was graduated from Haverford college, 1900, and in 1902 was appointed a member of the staff of the Brooklyn institute's biological laboratory. The following year he was made an assistant in the zoological department of the University of Chicago. He was resident investigator for the experimental evolution station at Cold Harbor, L.I. (maintained by the Carnegie institution), 1904–09. In 1909 he became assistant curator of the department of invertebrate zoology of the American Museum of Natural History, and was associate curator, 1916–21. When the museum created an independent department of entomology in 1921, Dr. Lutz was appointed curator, a post he held until his death. Under his guidance, some 2,000,000 specimens of insects were collected and assembled. He wrote *A Lot of Insects* (1941) and *Field Book of Insects* (1917). Dr. Lutz died Nov. 27 in New York city.

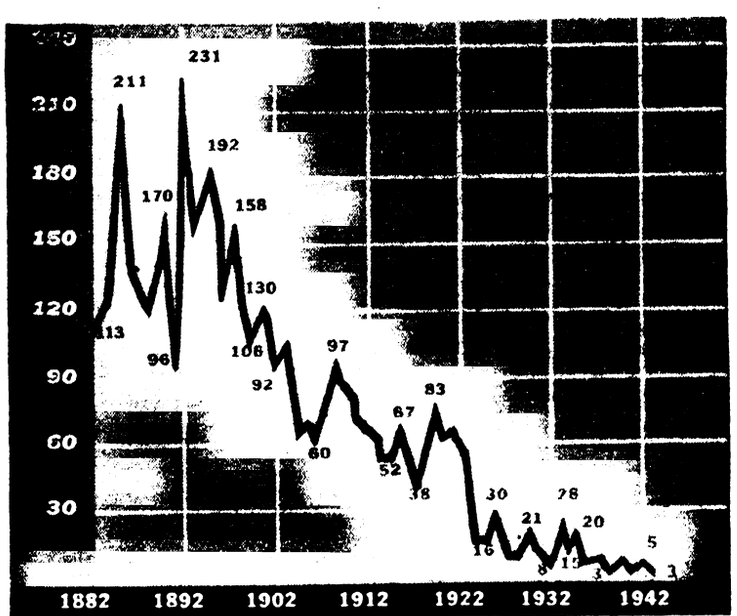
Lutze, Viktor (1890–1943), German storm trooper chief, was born Dec. 28 in Bewergen, Germany. A veteran of World War I, he was forced to leave his job in the German post office, because of the loss of an eye, and turned to politics. An early believer in national socialism, he was one of the first to join the storm troopers. When Hitler became chancellor, Lutze was made police president and later provincial governor and state counsellor of Hanover. After Hitler purged the nazi party ranks in June 1934, Lutze succeeded Ernst Roehm as head of the S.A. (Sturm Abteilung) troops. It was rumoured

that he was rewarded with the post because of his willingness to curb the rising power of the organization he had helped to build, for remunerative considerations—he was said to have been one of the richest nazi leaders. Lutze ruthlessly cleansed the S.A., ousted all non-party members and all followers of the ill-fated von Schleicher and Roehm. He then recast his paramilitary force into an anti-Christian, "philosophical" group. His death in Potsdam, May 2, followed an auto accident, the details of which were not disclosed. He was posthumously awarded the highest grade order of the German Eagle by Hitler.

Luxembourg. A grand duchy situated between France, Germany and Belgium. Area, 999 sq.mi.; pop. (est. 1942) 301,000; chief city, Luxembourg (cap. 59,000); language, Luxembourgian (idiomatic) and (officially) French and German; religion, 98% Roman Catholic. Ruler in 1943 (since 1919): Grand Duchess Charlotte.

The grand duchess was forced to flee on May 10, 1940, as German troops swept into the country and placed it under martial law. In a plebiscite on Oct. 10, 1941, asking the people to vote to become German citizens, 98% refused. The loyal Luxembourgers still adhered to the sentiment of their patriotic national song, "We want to remain what we are."

On Aug. 30, 1942, Luxembourg was incorporated by decree into the German reich, and a mobilization order summoned its citizens to military service in the German army. This action was vigorously protested by the workers who called a general strike. As a result, orders were given that strikers were to be sentenced to death, and many were deported into Germany. In their place many Russian prisoners were brought in to work in the mines, but in 1943 the average iron ore output per day per worker fell from 13½ to 8½ tons. (S. B. F.)



Lynchings. The lynching record, which showed a slight increase in 1942, turned downward again toward the vanishing point in 1943, with only three victims reported. Three states were involved, Florida, Georgia and Illinois. All the victims were Negroes. The respective offenses alleged were: resisting arrest; killing a white man; and insulting white women by telephone. One of the victims was clubbed to death by a sheriff, his deputy and a county policeman; one was taken from jail and shot by four masked men; the third, a soldier, was shot to death by a mob of farmers when he attempted to escape from a farmhouse. The outcome of the first case was unusual in that the three officers involved were tried and convicted by a jury of their fellow Georgians and sentenced to prison by a Georgia judge. Nine cases were reported in six southern states in which officers of the law prevented attempted lynchings, and one in New Jersey in which civilians restrained a threatening mob of sailors. Following are brief stories of the three lynchings of the year:

Newton, Ga., Jan. 29: Robert Hall, young Negro mechanic charged with stealing an automobile, was arrested and turned over to Sheriff Claude Screws, of Baker Co. Later that night, severely beaten and bearing 21 abrasions, contusions and cuts, Hall was taken from the jail to a hospital in Albany, where he died next morning. The officers claimed that he had been beaten while resisting arrest and trying to shoot the sheriff. On April 9 a federal grand jury indicted the sheriff, his deputy, Jim Kelly, and Frank Jones, a county policeman. In October the three were convicted in federal court of violating civil liberties statutes, and each was sentenced by Judge Bascomb Deaver to three years' imprisonment and a fine of $1,000.

Marianna, Fla., June 16: Cellos Harrison, 31-year-old Negro awaiting trial on the charge of killing a filling station operator, was taken from the county jail by four masked men. According to the jailer, the four gained admittance to the jail by telling him they wished to lock up a drunken man. Some hours later Harrison's dead body, severely beaten, was found in a ditch five miles from Marianna. The masked men were not identified, no arrests were made and no indictments returned.

Fulton Co., Ill., Nov. 7: Pvt. Holley Willis, Negro soldier from Camp Ellis, was shot to death at midnight by a posse of white farmers. He was attempting to escape from a farmhouse, where, it was claimed, he had made insulting telephone calls to several families in the community. Four members of the mob confessed participation, but were exonerated by the coroner's jury, which rendered a verdict of "justifiable homicide."

(R. B. E.)

LYNCHINGS in the U.S. from 1882 to 1943, based on figures of the department of records and research, Tuskegee institute

Lyttelton, Oliver (1893–), British government official, was born in England and educated at Eton and at Trinity college, Cambridge. He saw continuous active duty in World War I, 1915–18, serving as brigade major with the Grenadier Guards. Awarded the military cross and the D.S.O., he was demobilized with the rank of captain. After the war he entered business, became managing director of the giant British Metal Corp., Ltd. With the onset of World War II, in Sept. 1939, he entered the ministry of supply as the controller of nonferrous metals. In Oct. 1940, Prime Minister Churchill appointed him president of the board of trade. Since a parliamentary seat had to be found for him, he was elected M.P. for Aldershot. In 1941, he became a minister of state and a member of the war cabinet. Churchill established precedent by sending him as British representative to the middle east, the first time in history that a full-ranking cabinet officer had been established in overseas headquarters. He was recalled in 1942, to assume the post of minister of production. To pool the production resources of the U.S. and Great Britain, he and WPB Director Donald Nelson were named co-administrators of a combined production and resources board. In Aug. 1943 Lyttelton announced that British aircraft production for the second quarter of 1943 had exceeded the same period for 1942 by 44%.

McAdie, Alexander George (1863–1943), U.S. meteorologist, was born Aug. 4 in New York city. He was graduated from the College of the City of New York, 1884, and received his M.A. degree from Harvard university, 1885. Prof. McAdie, who served overseas during World War I as an aerographic officer for the navy, was associated with weather bureaus in several large cities. He was lecturer in physics at Clark university, Worcester, Mass., 1889–90, and was later professor of meteorology at Harvard and director of the Blue Hill Meteorological observatory, Milton, Mass. Prof. McAdie, who retired in 1931, was credited with pioneer work in establishing the foundations for contemporary methods of weather forecasting employed by bomber and fighter pilots.

McAdie died Nov. 1 in his home near Hampton, Va.

McAfee, Mildred H. (1900–), commander of the U.S. women's naval reserve unit (WAVES), was born on May 12 in Parkville, Mo., and was graduated from Vassar in 1920. She was acting professor of economics and sociology at Tusculum college, Greeneville, Tenn., 1923–26, and received her master's degree at the University of Chicago in 1928. She was dean of women at Centre college, Danville, Ky., 1927–32, and at Oberlin college, 1934–36, and was appointed president of Wellesley college in 1936. After the outbreak of World War II, she was named a member of the education advisory committee for the navy training program, working with naval personnel on plans for a women's reserve. When President Roosevelt signed the bill creating a women's naval reserve on July 30, 1942, Miss McAfee was chosen to head the WAVES (Women Appointed for Volunteer Emergency Service) (*see* WOMEN'S RESERVE OF THE NAVY) and she was sworn in Aug. 3, 1942, with the rank of lieutenant commander. On Jan. 15, 1943, the navy announced that 4,500 officers and 31,000 enlisted men would be replaced by WAVES. Six months later a goal of 91,000 by the end of 1944 was set.

On Aug. 2, during a three-day celebration of the first anniversary of the unit, Comdr. McAfee and Mrs. Roosevelt reviewed 2,500 WAVES at the naval training station, Hunter college, New York city.

Macao: *see* PORTUGUESE COLONIAL EMPIRE.

MacArthur, Douglas (1880–). U.S. army officer, was born Jan. 26 in Little Rock barracks, Ark., the son of Lt. Gen. Arthur MacArthur. Graduated from West Point in 1903, he was commissioned in the engineer corps.

(See *Encyclopædia Britannica.*)

Following Japan's attack on the Philippines he was renamed a full general by President Roosevelt, Dec. 19, 1941, and led Filipino and American forces in the defense of the islands. Although heavily outnumbered in men and material, MacArthur slowed the Japanese advance and retired to the Bataan peninsula. He left the Philippines on Roosevelt's orders and reached Australia on March 17, 1942, to assume command of the United Nations' armies in the Southwest Pacific. In the fall of 1942, U.S. and Australian troops launched a counter-offensive to reconquer New Guinea.

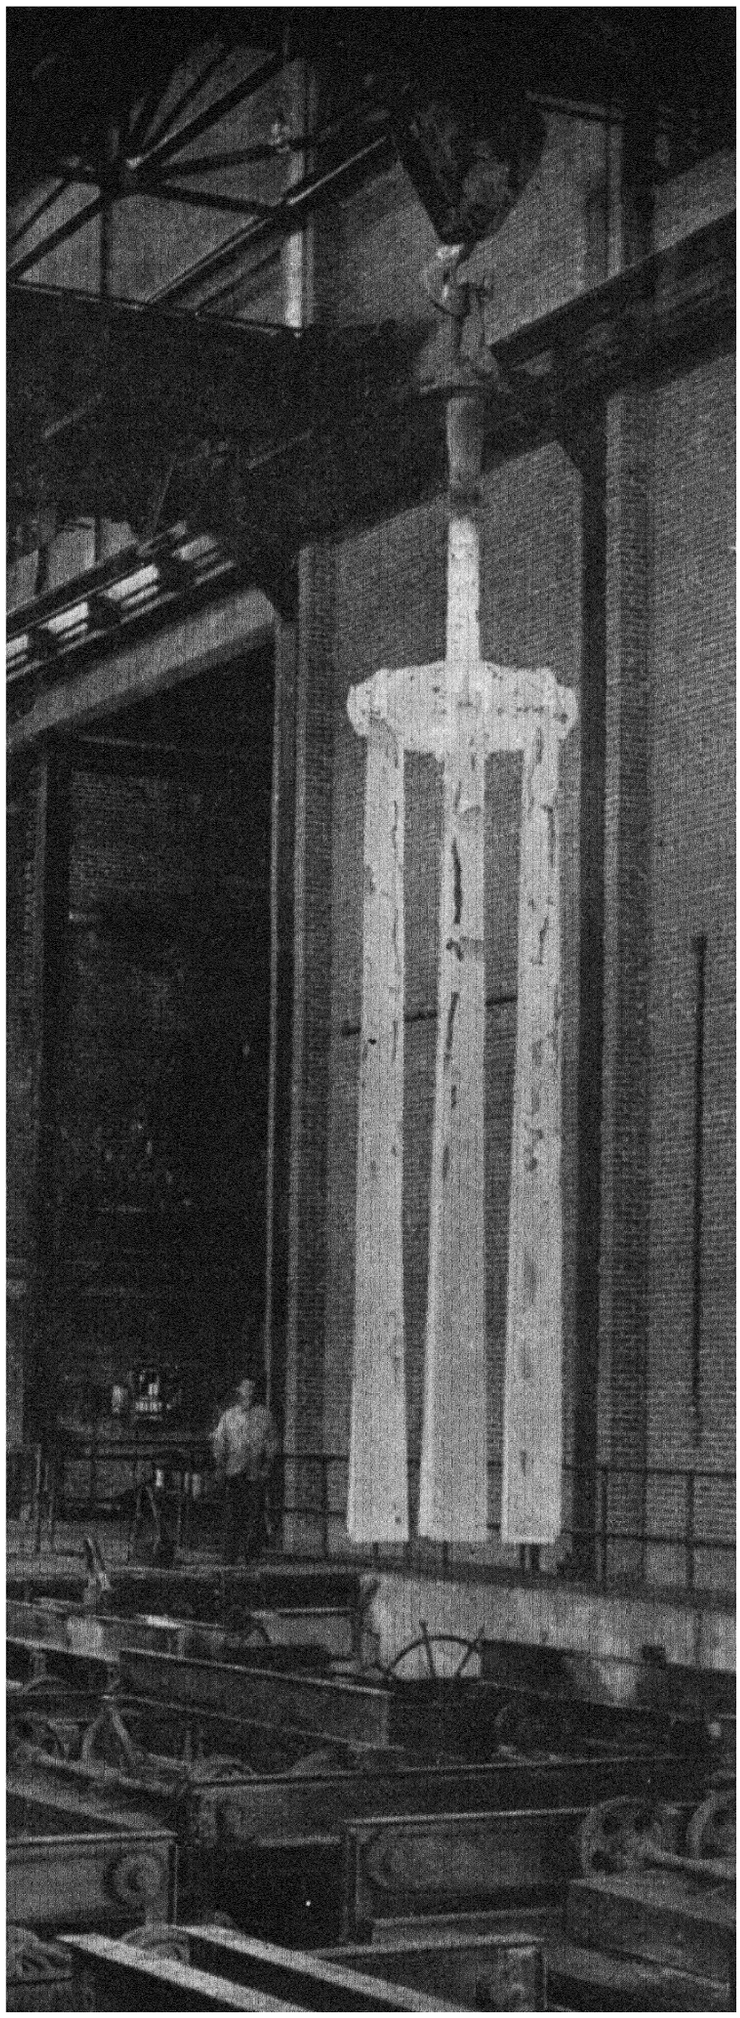
By the end of 1943, the Japanese had been driven from the strategic Huon gulf and MacArthur's armies had landed on New Britain. MacArthur had urged "swift, massive strokes" rather than island-hopping to achieve victory and subsequently expressed disappointment over Allied tardiness to launch a counter-offensive in the Pacific After disclosure that Lord Louis Mountbatten had been given command of the Southeast Asia war theatre, MacArthur asserted that he would be content with a minor role in the interest of common victory. On Dec. 22, 1943, it was disclosed that MacArthur and Gen. George C. Marshall had met in New Guinea for a conference on Pacific strategy. Although MacArthur had declared in Oct. 1942 that he had no political ambitions, some Republican leaders regarded him as presidential timber and had started a minor MacArthur boom in late 1943. In Dec. 1943, the war department ruled that officers could accept a draft nomination for the presidency.

McGill, Frank Scholes (1894–), Canadian airman, born in Montreal, June 20, was educated at McGill university (1911–13). In World War I he joined the royal naval air service, in which his distinguished and varied service at so early a period put him in the line of later leadership. He served especially with the seaplane carrier "Vindex," with the Dover patrol and in many fields. After the war McGill was associated with the Dominion Linoleum Co. of Montreal, becoming director and secretary. Even before war broke out in 1939 McGill organized No. 115 auxiliary (air) squadron. His active service began immediately with the war (Sept. 1939) and from that date he played a leading part in the organization and training of Canadian airmen and is generally regarded as among the most distinguished and efficient war leaders of Canada. He was commanding officer at Camp Borden, Uplands and Trenton. Entering as squadron leader, McGill passed through the various grades of promotion to become air vice marshal in 1942. (S. LEA.)

Machinery, Farm: *see* AGRICULTURE.

Machinery and Machine Tools. Shipments of tools from builders' plants in the United States during 1943 totalled about $1,183,000,000,

FROM A FLYING FORTRESS, Gen. Douglas MacArthur personally directed the mass landing of Allied paratroopers behind the Japanese lines northwest of Lae Sept. 5, 1943. This surprise attack led to the capture of Lae



which was a little less than the all-time record of $1,321,748,000 established by that industry during 1942. The tremendous expansion in production facilities and manufacturing efficiency which made possible these production records could, in a measure, be indicated by the fact that in the war-boom year of 1918 this industry shipped a total of about $220,600,000 worth of its products.

The year 1943 also saw a great expansion in the productive efficiency of other branches of the metalworking industry, almost all of which was diverted to the manufacture of combat and service equipment for the fighting forces of the United Nations. During the year the aeroplane manufacturing industry produced from 86,000 to 87,000 military aeroplanes. In this connection, it is of interest to note that in the three-year period ending with 1943, aircraft production increased 42 times while production per worker was practically doubled during 1943. Other industries showed accomplishments just as important to the war effort.

As during 1942, the demand for high war production during 1943 stimulated the development of new and improved methods. Included in this trend was the greatly increased use of induction heating equipment for forging, heat-treating, annealing and brazing operations. Another development which was given considerable impetus during the year was that of increasing milling production rates by using cutters having negative rake and helix angles. Cutters were operated at surface speeds up to about 900 ft. per min. and at feeds up to 60 in. per min. when milling steel. When milling aluminum alloys and other nonferrous metals, similar cutters were operated at speeds of more than 10,000 ft. per min. with feeds in excess of 200 in. per min. The milling cutters employed for these operations all had cutting edges tipped with tungsten-carbide. Usually, such milling cutters had fewer teeth than was common practice in more conventional milling operations.

Another development which received much attention during 1943 was the sub-zero cold-treatment of steels for austenitic decomposition after heat-treatment in order to produce greater hardness, and for the "stabilization" of gauges so they would maintain their size for a longer time. While there was considerable variation in the procedures employed by various users of this process, the successful application of sub-zero refrigeration equipment indicated the value of additional research work along this line. Increasing use also was made of mechanical refrigeration equipment capable of maintaining temperatures down to −120° F. for making precision shrink fits. With this equipment, it was possible to assemble ball and roller-bearing races and other parts in machine units by merely slipping them in position after chilling.

As was the case during 1942, manufacturers of machine tools and other production equipment for the metalworking industry concentrated on the production of standard models during 1943, in order to facilitate increased production. Development of new units and the improvement of older models again was delayed until engineering time could be devoted to such projects without hindering the war effort. Of course, it was necessary for the machine tool industry to develop and build special units to meet increased production demands for some war products which could not be made fast enough with standard equipment. Typical of these were a number of special machines designed and built for certain operations on parts for aircraft engines and similar units.

TUBES OF U.S. ANTI-AIRCRAFT GUNS, cast in one piece by a revolutionary method developed by the army ordnance department. Molten or liquid metal is poured into a chill mould which is rotated at a high speed so that centrifugal force causes the metal to take the shape of the mould before it solidifies, leaving a hollow in the centre. The casting is removed from the chill mould as soon as it is solid and rigid enough to keep its shape during handling. After cooling, it is heat treated to get the desired crystalline structure of the metal and then machine finished and further heat treated

In these cases, the special engineering required for the development of the units was justified by the fact that the necessary increased production was achieved, with an accompanying reduction in productive workers needed.

Among the new standard units made available during 1943 was a precision thread grinder in which either a single-ribbed wheel or a multi-ribbed wheel could be used for grinding single or multiple lead, right or left-hand threads with any pitch up to 60 threads per inch. This machine grinds either by traversing of the wheel along the work, or by plunge cutting. In the plunge cutting operation, a multi-ribbed wheel sufficiently wide to equal the thread length is fed into the full depth of the thread, and the threaded increment is formed in one pass, with the stock making 1¼ to 1½ turns. This machine will grind in one pass two, three or four multiple-start threads in most cases.

Also made available during 1943 was a precision thread rolling machine of unusual type with which either tapered or straight threads can be rolled on bolts, studs, grooves and other parts made of high-tensile strength steels. The principal feature of this machine is the use of two steel rolls of large diameter, having on their faces negative multiple threads of the same profile, pitch and helix angle as the thread to be rolled. These rolls are pressed with gradually increasing hydraulic pressure into the workpiece or blank. All threads are rolled simultaneously. Rolling pressure and speed of the rolls can be adjusted to suit the metal and the pitch and diameter of the thread. The sustained rolling pressure made possible with the design of this machine condenses the metal forming the thread, and produces a strong thread that is burnished to a mirror-like polish.

Said to be the largest machine of its type ever built, a gear shaving machine developed during the last part of 1943 had capacity for gears from 24 to 96 in. in pitch diameter and up to 97 in. outside diameter. The maximum shaving range from the headstock spindle was 110½ in. This machine was designed for finishing gears for large steam turbine reduction units, as well as timing gears for large diesel engines.

Two sizes of a turret lathe with a completely automatic machining cycle were placed on the market during 1943. Built into each of these machines was a flexible hydraulic system that provided an independent feed for each face of the turret. Multiple cutting and various combinations of machine movements could be performed readily with these machines. Speed changes are made automatically and can be changed at any time while the machine is in operation, during the cut, or at the end of the turret stroke. Constant headstock temperature for precision spindle alignment is maintained in these machines by a thermostatically-controlled heating system.

An electronic instrument for checking and sorting metals and alloys for metallurgical properties was announced during 1943. This instrument performs both qualitative and quantitative metallurgical tests on ferrous and nonferrous metals by nondestructive means. Machinability, toughness and internal stresses are among the physical properties which can be successfully evaluated. Such factors as structure, analysis and heat-treatment determine penetration hardness and affect readings of the instrument. For instance, the extent of age hardening in aluminum alloys or decarbonization of ferrous alloys may be evaluated. The instrument operates on the principal that metallurgical properties cause variations in the core loss of a tuned pick-up coil in which the part is placed. These variations affect the shape of a visible pattern shown on the instrument's indicator screens, or can be made to control an automatic solenoid-operated mechanism for sorting large quantities of parts. The instrument is not an all-purpose tool, since it must be correlated for the duties to be performed in order that dependable readings may be obtained.

In addition, a number of interesting developments were made in the fields of mechanical handling equipment in order to make it possible to employ women in metalworking plants on jobs formerly beyond their strength. Many jobs had been confined to men because of the weight-lifting factor. Therefore, much attention was paid in a number of plants to the development of work-handling devices that would permit the employment of women on jobs otherwise beyond their strength or unsuited to their physical characteristics. Among these were transfer units for moving relatively heavy parts from conveyor lines to machine tools, and then back onto the conveyor line after a machining operation was completed. (*See* also AUTOMOBILE INDUSTRY IN THE WAR.)

(B. C. B.)

McIntyre, Marvin Hunter (1878–1943), U.S. newspaperman and secretary to President Roosevelt, was born Nov. 27 in La Grange, Ky. He started newspaper work at the turn of the century and became editor of the *Washington Times*. In 1917, he entered the navy department as public relations officer and made the acquaintance of Franklin Delano Roosevelt, then assistant secretary of the navy. In 1932, McIntyre helped handle publicity for Mr. Roosevelt during the presidential campaign. After the election McIntyre was given the post of assistant secretary and in 1937, after the death of Louis Henry Howe, he was made secretary, a post he held until his death, Dec. 13, 1943, in Washington.

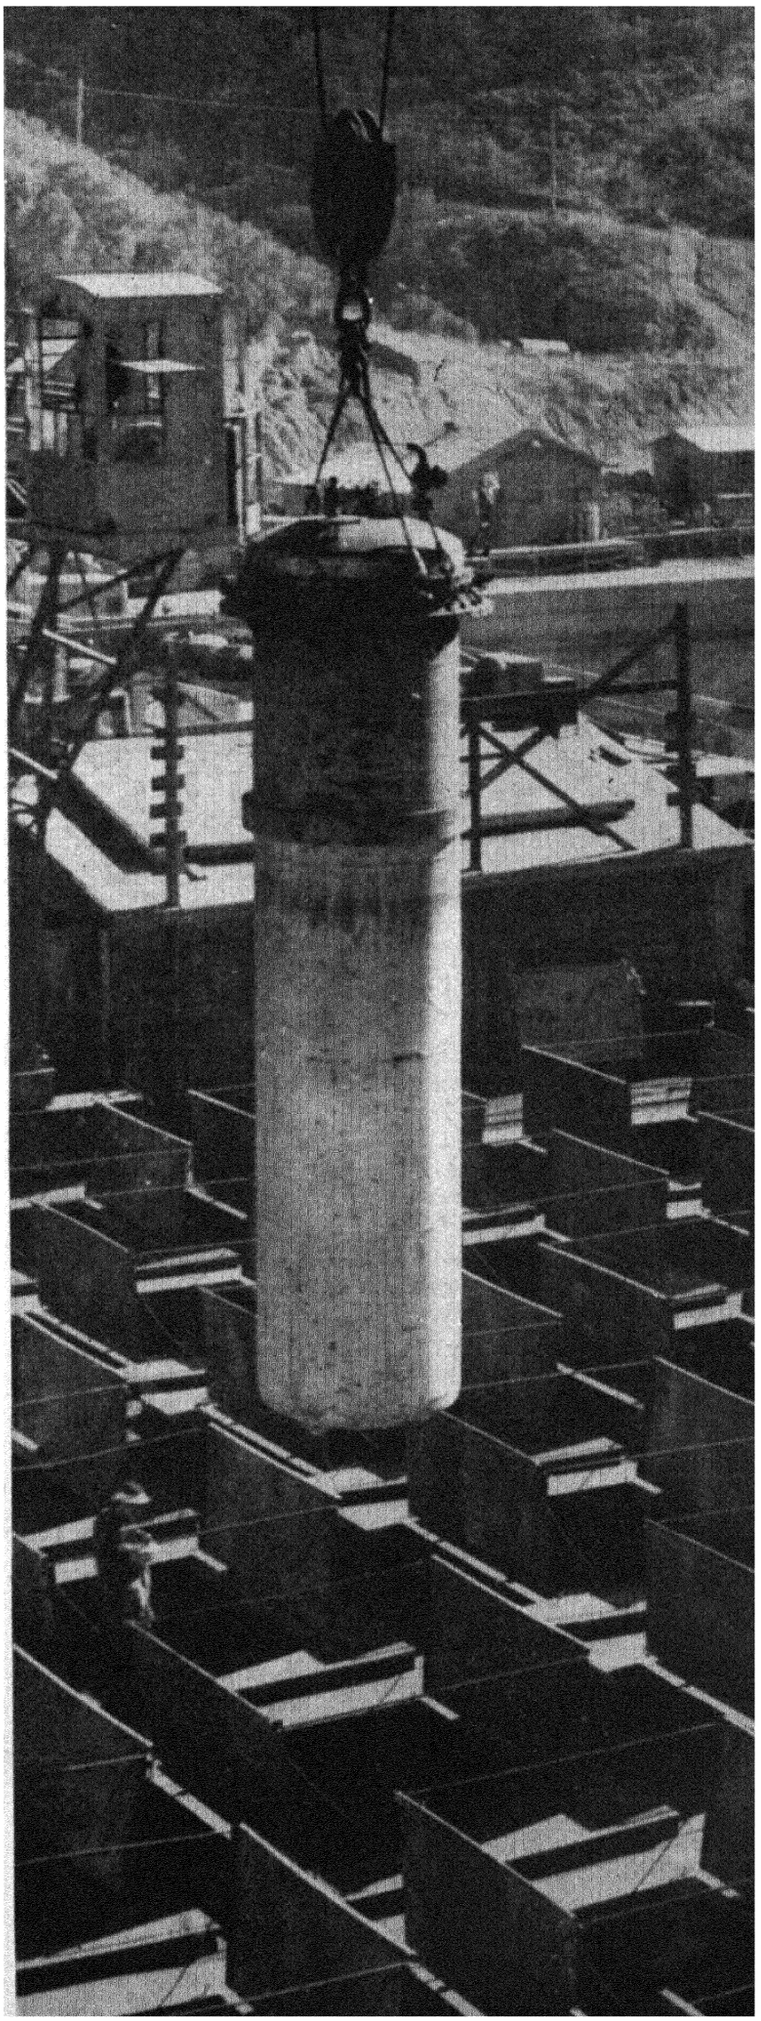
McKenna, Reginald (1863–1943), British banker and politician, was born July 6 in London. After finishing his studies at King's college, London, and at Cambridge, he practised law until 1895, when he was elected as Liberal candidate to the house of commons from North Monmouthshire. He held various cabinet posts from 1905 to 1916 and left the government when the Asquith cabinet fell in 1916. The following year he became director of the London and Midland bank and held the chairmanship of this institution from 1919 until his death. He died in London Sept. 6.

Mackenzie King, William Lyon: *see* KING, WILLIAM LYON MACKENZIE.

McNair, Lesley James (1883–), U.S. army officer, was born May 25 in Verndale, Minn. A graduate of West Point, 1904, he served with the Funston expedition to Veracruz, 1914, and the Pershing expedition to Mexico, 1916. During World War I, he saw duty with the First division in France, was attached to general headquarters of the A.E.F. and was awarded the D.S.M. Gen. McNair attended the Army War college, 1928, and became commandant of the Command and General Staff school, 1939. With war imminent, he was assigned to duty at the Army War college in Washington. After reorganization of the war department general staff in 1942, McNair became commanding general of the army ground forces. He saw active duty in the North African campaign. While at a forward observation post in Northern Tunisia, he was wounded by shell fragments and returned to the U.S. for treatment. He resumed command of the ground forces, May 26, 1943.

McNaughton, Andrew George Latta (1887–), Canadian army officer and scientist, was born at Moosomin (Sask.) Feb. 25; he was educated at McGill university and served conspicuously in World War I. In May 1919, McNaughton was appointed member of the committee for the reorganization of the military forces of Canada, and in 1922 deputy chief of the Canadian general staff. In 1922 he was promoted to chief of the general staff, a position

which he held until he became president of the Canadian National Research council (1935). He served in that capacity till Oct. 1939, when he was appointed commander of the Canadian active service forces. In Dec. 1939 Gen. McNaughton landed in Great Britain with the 1st Canadian division. He was responsible for the intensive training and scientific arming of the Canadian forces both at home and abroad; the Canadian troops which served at Dieppe (Aug. 19, 1942) were trained by him. On Dec. 26, 1943, it was announced that Gen. McNaughton had given up the command of the Canadian active service forces and was retiring, owing to ill-health. (J. I. C.; S. LEA.)



McNutt, Paul Vories (1891–), U.S. politician and government official, was born July 19 in Franklin, Ind. Educated at Indiana university (A.B., 1913) and at Harvard (LL.B., 1916), he served on the faculty at Indiana university law school, 1917–25, and was dean of the law school, 1925–33. He became national commander of the American Legion in 1928, governor of Indiana in 1933, high commissioner of the Philippines in 1937, and first administrator of the Federal Security administration in 1939. On April 18, 1942, President Roosevelt made McNutt head of the War Manpower commission, a new agency to assure swift mobilization and distribution of the nation's manpower in war industries. In December, WMC powers were enlarged, and McNutt was given authority over the Selective Service system. On April 17, 1943, he ordered the "freezing" of 27,000,000 workers in essential jobs. Protests were widespread and vigorous. On May 3, the order was rescinded and arrangements put in effect for accomplishing the same ends on a regional basis. In Dec. 1943, a new draft bill, which deprived McNutt of his power over Selective Service, became law.

Magazines and Periodicals: *see* NEWSPAPERS AND MAGAZINES.

Magee, John Benjamin (1887–1943), U.S. educator, was born July 19 in Albion, Ia. He received his Ph.D. from Upper Iowa University in 1909 and his S.T.B. from Boston university in 1912. Ordained in 1910, he served in the educational department of the Methodist Episcopal Board of Sunday Schools, 1912–13, and held various pastorates from 1913 to 1939. He was named president of Cornell college, Mount Vernon, Ia., in 1939 and held that post until his death. Dr. Magee died at Excelsior Springs, Mo., April 6.

Magnesite. The mine production of crude magnesite in the United States in 1942 increased 12% over 1941, to 497,368 short tons; sales during the year included 35,485 tons of caustic calcined and 273,661 tons of refractory magnesia, obtained from sea water, bitterns and dolomite, brucite and magnesite. Sales of dead-burned dolomite increased from 1,069,887 short tons in 1941 to 1,229,357 tons in 1942. Production of other magnesium compounds, chloride, sulphate, hydroxide and precipitated carbonate, from the same sources as the magnesite output totalled 362,892 short tons in 1942, as compared with 103,906 tons in 1941. (G. A. RO.)

Magnesium. There was no official report on the annual magnesium output after 1940 in the United States, when it totalled 6,412 short tons, but an extensive program of ex-

HUGE CONTAINER OF MAGNESIUM being carried over retort furnaces at the plant of The Permanente Metals corporation near San Francisco. This plant, managed by Henry J. Kaiser, was in full production in 1943

pansion was inaugurated, mostly in government-owned plants, which was scheduled for completion in 1943. In 1941 enough new capacity was added to produce an estimated 20,000 to 25,000 tons during the year, and this was greatly increased in 1942, but no figures on output were reported. The only basis on which to estimate the 1943 status of the industry was an official announcement in Aug. 1943, that in the seven months, January to July, output had totalled 116,770 short tons. The July output was given as 17,450 tons in government-owned plants and 1,750 tons in privately-owned plants.

The January to June total averaged only 16,556 tons per month, against 17,450 tons in July, indicating that an appreciable amount of new capacity had been added in the first half of 1943, but whether the new plant capacity was all in full-scale operation by July was not known. In any case, the January-July output as reported, plus the remaining five months of the year at the July rate would give a total of 204,000 tons for the year, which might be increased for the year, if all plants had not been in full operation in July. The press reported that the scheduled output was at a rate of 265,000 tons a year.

This increased output resulted in several decreases in the price of the metal, which dropped from 27 cents per pound in Aug. 1939, to 20½ cents. (*See* also BUSINESS REVIEW; METALLURGY.)

(G. A. Ro.)

Mail-Order Business: *see* BUSINESS REVIEW.

Maine. The extreme northeastern state of the United States, admitted as the 23rd state in 1820, and popularly known as the "Pine Tree state." Land area 31,040 sq.mi.; water area 2,175 sq.mi.; pop. (1940) 847,226. Rural dwellers numbered 504,169, while 343,057 were classed as urban. The capital is Augusta (19,360). The largest cities are Portland (73,643); Lewiston (38,598); Bangor (29,822).

History.—The state legislature met in Jan. 1943 for its regular session and adjourned in April. Most of the bills passed were concerned with routine matters or amendments to existing law. Fish and game laws were simplified and a postwar planning fund established. The state personnel board granted a general pay increase in all departments, after the legislature had appropriated larger amounts for personal services for the biennium beginning July 1, 1943. Numerous individual increases were also granted by the board, but rapid turnover and shortages continued to be serious, especially in state institutions. Republican governor Sumner Sewall of Bath began his second term (1943–44) and announced that he would not be a candidate for a third term.

Education.—The University of Maine, Bates, Bowdoin and Colby colleges operated with reduced civilian enrolments, but were aided by army and navy programs designed to train meteorologists, fliers, engineers, etc. Elementary and secondary schools suffered a teacher shortage, and a few schools closed at the opening of the fall term. The net enrolment of the state's 2,014 elementary schools in 1940–41 was 122,528; that of the 275 secondary schools, 46,121. There were 6,899 teachers employed in the state during that year.

Public Welfare, Charities, Correction.—The 13 state institutions (correctional, insane hospitals, sanatoria) were generally overcrowded and under-staffed in 1943. High employment levels resulted in a low unemployment compensation case load. Public assistance in large part took the form of aid to the aged, aid to the blind, aid to dependent children and World War I relief, with the first category containing by far the largest number of cases (15,742 in June 1943). The largest average monthly grant was to those receiving World War I relief ($40.28 in June 1943).

Communication.—The total mileage of the state's highways at the end of the year 1941 was 21,862. During 1942 there were 221,371 registered motor vehicles in Maine.

Banking and Finance.—As of June 30, 1942, the Maine banking department supervised 168 fiscal institutions including 32 mutual savings banks (with 2 branches), 31 trust companies (with 54 branches), 34 building and loan associations, 8 loan companies, 5 credit unions and 1 industrial bank (with 1 branch). The assets of these institutions totalled $326,292,778 and those of the 35 national banks in the state $153,323,000.

State receipts, expenditures and bonded debt for the fiscal year beginning July 1, 1942, were as follows: total funds available, $47,107,166; total authorized, $33,456,142; bonded debt, $24,305,500. On Dec. 31, 1942, the state valuation totalled $704,000,491. The valuation per capita was $831 and the state tax rate $7.25 per $1,000.

Agriculture.—A moist 1943 season contributed to produce luxuriant farm crops and victory gardens, although harvesting of hay was difficult because of rainy and cloudy weather.

Leading Agricultural Products of Maine, 1943 and 1942

Crop	1943 (est.)	1942
Corn, bu.	640,000	672,000
Wheat, bu.	48,000	40,000
Oats, bu.	3,315,000	4,017,000
Barley, bu.	120,000	112,000
Buckwheat, bu.	140,000	119,000
Hay, tons	863,000	901,000
Potatoes, bu.	73,485,000	42,660,000
Apples, bu.	704,000	813,000
Beans, tons (dry)	3,250	4,150

Manufacturing.—The total value of manufactures (1939 census, last before World War II) was $345,368,595. Total employment was 81,995, and wages paid $82,026,503. No reliable figures were available to show the effect of war on industry in 1943. Maine shipyards continued at full production until Dec. 1943, when the seven day week was discontinued and barge production stopped, by order of the U.S. Maritime commission.

Mineral Production.—The total value of minerals produced in Maine in 1939 was $3,769,671, as compared with $3,548,638 in 1938. Stone, sand, and gravel production was low in 1943, while feldspar and peat production was up. (E. F. D.)

Manchuria ("MANCHOUKUO"). An empire, in practice a Japanese dependency, located in northeastern Asia, bounded N. and E. by soviet Siberia, W. by soviet Siberia, Outer Mongolia and China, S.E. by Chosen. Area, 548,000 sq.mi.; pop. (1939), 39,454,026, including 642,300 Japanese, 1,162,000 Koreans and 1,035,525 Mongols. Before the Japanese occupation in 1931–32, Manchuria contained the three northeastern provinces of China, Fengtien, Kirin and Heilungkiang, and was administered separately from China proper by Chang Hsueh-liang, who succeeded his father, Chang Tso-lin. Capital, Hsinking (the former Changchun). The largest cities (Dec. 1939) were Mukden (863,515), Harbin (517,127), Hsinking (415,264), Antung (220,587). Later estimates credited Mukden with a population of more than 1,000,000 and Harbin with about 650,000 inhabitants. The principal religions of Manchuria, in the order of numbers of adherents, were Buddhism, Taoism, Lamaism, Mohammedanism and Christianity. There were about 130,000 Roman Catholics and about 125,000 Christians of other denominations. The emperor in 1943 was Kang Teh.

History.—Manchuria remained outside the area of active warfare in the far east in 1943, and no events of outstanding importance were recorded during the year. The state of "Manchoukuo," never recognized by the United States, Great Britain, China and most of the United Nations, came into existence as a result of the military aggression of the Japanese army, which seized Mukden, the seat of the former Manchurian administration, on Sept. 18, 1931. This occupation was subsequently extended to the entire country. A committee of Manchurians who were ready to accept Japanese domination proclaimed an independent state Feb. 18, 1932. Henry Pu Yi, a scion of the Chinese Manchu dynasty, was inaugurated as chief executive of the new government on March 9, 1932. He was proclaimed emperor, under the name of Kang Teh, on March 1, 1934.

The Japanese army remained the actual power behind the administration of "Manchoukuo." The commander-in-chief of the Kwantung army, the Japanese force of occupation, became *ex officio* Japanese ambassador in Hsinking. The chief executive organ (no representative legislative body was set up) was the state council. A privy council was also established, with a mainly decorative function, as a consultative organ for the emperor. The Concordia association, which claimed a membership of 1,137,883 in 1939, became a pale copy of the single ruling party idea; one of its avowed purposes was to "establish inseparable relations between Japan and Manchoukuo." While most of the ministers named were Manchurians, actual power went to Japanese vice-ministers; and Japanese officials were in the majority in the powerful general affairs board. By a decision of the Cairo conference in Nov. 1943 Manchuria was to be returned to China after the end of the war.

Education.—Manchuria in 1939 possessed 15,877 primary schools, with 1,589,169 pupils. There were 238 middle schools, with 54,768 students; 40 normal schools, with about 8,000 students; and 13 institutions for higher education, with 3,820 students. Government expenditure on education in 1939 was 45,967,000 yuan.

Finance and Banking.—The yuan, unit of currency, is equivalent in value to the Japanese yen, pegged at 23.48 U.S. cents in Dec. 1941. The budget for 1940 was 573,550,000 yuan, as against 403,377,000 yuan in 1939. Japanese rule at first brought currency stability, but inflationary price symptoms were becoming evident by the end of the '30s.

Trade and Communication.—Exports during the first nine months of 1940 were 544,629,000 yuan; imports were 1,397,715,000 yuan. This unfavourable visible balance of trade reflected the heavy inflow of Japanese capital for industrial and military purposes. There were about 6,710 mi. of railways in 1940 and about 30,000 mi. of highways, of which 13,000 mi. were suitable for motor traffic. There was considerable construction of new railway lines, especially in the north and east of the country, under the new regime.

Agriculture and Mineral Production.—Manchuria's staple crop is the soybean, production of which varies from 130,000,000 to 210,000,000 bu. annually. There were 1,683,000 cattle, 2,000,000 sheep, 1,250,000 goats, 5,500,000 hogs, and 2,000,000 horses in 1937. The country produced 685,000 tons of rice and 74,667 bales of cotton in 1940.

Coal and low-grade iron are the principal mineral deposits; the output of coal in 1939 was 19,000,000 tons.

(W. H. CH.)

Mandated Pacific Islands: *see* PACIFIC ISLANDS, MANDATED.

Mandates. The mandates section of the secretariat of the League of Nations spared no pains to keep all available official and unofficial documentary material up to date throughout 1943. There was no break in continuity. Though unable to meet, owing to the war, the mandates commission received the mandatory powers' annual reports.

The moral and practical value of this international experiment remained undoubted; for the principles on which the mandatory system was based could not be ignored in the future study of colonial problems. These principles were, briefly, consideration of the social, moral and political welfare of natives as the primary object of administration; custodianship of peoples not yet able to stand by themselves, with the ultimate aim of self-government; collective supervision (with possibilities of wide extension) by an international body; application of economic equality to mandated territories.

The accompanying table lists the mandated territories with their mandatory powers and former administration. (*See* also NEW GUINEA.) (M. FE.)

Mandated Territories

Territory	Area Sq.mi.	Date of Mandate	Mandatory Power	Former Title	Former Administration
South West Africa, including Caprivi Zipfel, formerly part of Bechuanaland Protectorate	323,000	Dec. 17, 1920	Union of South Africa	German Southwest Africa	German Empire
Togo, comprising: (1) Togoland, *i.e.*, western section, excluding the seaboard (2) Togo, *i.e.*, eastern section and seaboard	13,041 21,809	July 20, 1922	Great Britain France	Togo	German Empire
Cameroons, comprising: (1) Cameroons adjoining Nigeria (2) Cameroons adjoining French Equatorial Africa	34,081 162,892	July 20, 1922	Great Britain France	Kamerun	German Empire
Tanganyika *Ruanda-Urundi*	363,000 21,230	July 20, 1922	Great Britain Belgium	German East Africa	German Empire
Palestine *Trans-Jordan* **Syria and Lebanon*	10,159 34,740 76,030	Sept. 29, 1923	Great Britain Great Britain France	Palestine Part of the Wilayat of Syria Syria	Ottoman Empire
New Guinea, Territory of, comprising: (1) Northeastern New Guinea (*i.e.*, the northern section of southeast New Guinea) (2) Bismarck Archipelago (New Britain, New Ireland, the Admiralty Isles, etc.) (3) Certain of the Solomon Islands (Bougainville, Buka, etc.)	93,000	Dec. 17, 1920	Commonwealth of Australia	Kaiser Wilhelm's Land Bismarck Archipelago German Solomon Islands	German Empire
Western Samoa, comprising Savaii, Upolu, etc.	1,133	Dec. 17, 1920	New Zealand	German Samoan Islands	German Empire
Nauru	8	Dec. 17, 1920	British Empire—Great Britain, New Zealand, and Australia, the present administrator	Nauru	German Empire
Pacific Islands North of the Equator, comprising: (1) Marianne or Ladrone Islands (except Guam) (2) Caroline Islands, comprising the Eastern Carolines and Western Carolines, together with Yap Island and Pelew (3) Marshall Islands	830	Dec. 17, 1920	Japan	No change	German Empire

*Syria and Lebanon were recognized by Great Britain and the Fighting French as independent republics in Sept. and Nov. 1941 (*see* LEBANON; SYRIA). In 1943 most of the subjects reserved for control under the mandate were relinquished by General Georges Catroux, for the French National committee, to the Syrians and Lebanese, whose full independence was, therefrom, only a question of time.

Mandel, Georges (1885–1943), French politician, was born June 5 at Chatou, France. Like many able Frenchmen of political ambitions, Mandel climbed the stepladder of journalism into the chamber of deputies. He followed the rising star of Georges Clemenceau, became the latter's assistant chief of cabinet during the first Clemenceau ministry in 1906 and continued to be a devoted friend and aid to the old "Tiger" throughout his lifetime. He was Clemenceau's chief of cabinet during World War I and was credited with maintaining internal order at a crucial period when French workingmen and soldiers showed signs of wearying of the war. After the war, Mandel became a deputy for the department of the Gironde. In 1938 he was appointed to the colonial ministry in the Daladier cabinet and in June 1940, while the German invasion was in full force, minister of interior in the cabinet of Paul Reynaud. After the Vichy government came into power, Marshal Pétain ordered the arrest of Mandel. The latter, however, fled to Morocco, was there arrested by Gen. Noguès and returned to France, where he was imprisoned. Mandel, who was of Jewish faith, was soon transferred to Germany, and a Geneva newspaper of June 5 reported his death in a German concentration camp.

Manganese. Items of information on manganese were few during 1943. That ferromanganese was kept throughout the year on the list of materials of which there was a surplus of supply might be taken as an indication that on the whole the United States supply was maintained in a satisfactory condition, but there were also indications that the strenuous attempts to build up any appreciable domestic output were not very successful.

World Production of Manganese Ore

(In thousands of metric tons)

	1937	1938	1939	1940	1941
Brazil	253	222	193	226	433
Cuba	131	124	102	120	251
Egypt	186	153	120	?	?
Gold Coast	536	329	342	?	?
India	1,068	983	858	?	?
South Africa	631	552	420	412	460?
U.S.S.R.	2,752	2,273	?	?	?
Others	565	580	450?	?	?
Totals	6,120	5,200	4,600?	?	?

The results with high-grade ores were apparently fairly good, but the work on low-grade ores did not make much progress, so far as could be learned, though no specific statements could be made about either, since no reports were available on outputs in either class.

Neither were reports made on imports, but it was learned from South Africa that shipments from there were greatly hampered by lack of shipping, and it seemed probable that Brazil and Cuba supplied the bulk of the imports.

In spite of shipping troubles, production kept up in South Africa; some of the surplus over exports was absorbed by increased local sales, and the remainder was stocked, ready for shipment at any time that shipping space could be secured.

Brazil was engaged in 1943 in the development of a local steel industry which would take some of the manganese output, but the amounts needed would not be large enough to make any very serious cut in exports to the United States, even though production could not be increased to cover the home demand. There would seem to be a goodly amount of wishful thinking in a German comment which implied that the new steel industry would require such large amounts of manganese that the Brazilian government would no longer be interested in fostering exports to the United States.

The German excursion into southern Russia did not bear much fruit in the shape of access to manganese supplies. The Germans failed to reach the major producing areas in the Caucasus, and the disastrous retreat had put back into Russian hands the smaller deposits of the southern Ukraine, which had been in German hands for some months, but probably not long enough for them to have done much with them, especially if the Russians in their original retreat from this section followed their usual scorched earth policy. (G. A. Ro.)

Manitoba. A central province of Canada; area 246,512 sq.mi. (26,789 sq.mi. water); pop. (1941 final census figures) 729,744; urban 44%; Canadian-born 73%. Capital, Winnipeg (221,960). Other cities are St. Boniface (18,157), Brandon (17,383) and Portage la Prairie (7,187).

History.—Stuart S. Garson took the oath of office as 12th premier on Jan. 14, 1943, succeeding John Bracken, who became leader of the Progressive-Conservative party of Canada, and who had created the present coalition government which continued. No changes in the cabinet took place. Five by-elections during the year resulted in the coalition government's winning three (one by acclamation) and the Co-operative Commonwealth Federation party, two.

Education.—Pupils in elementary grades in 1942 numbered 105,170 and in secondary grades 21,440. Government graded correspondence students numbered 1,836. Public school teachers numbered 4,484.

Agriculture.—The Winnipeg Grain exchange was closed on Sept. 28 under order of the federal government as a war measure. Total (gross) agricultural production reached a peak in provincial history of $230,000,000 due to increased production in coarse grains, hogs, butter and eggs, and increased prices generally.

Manufacturing, Minerals, Fisheries, Furs.—Manufactures (1941) were valued at $211,534,751; minerals (1942) $14,643,269; fisheries (1942) $3,843,331 (increase in value of 17%, decrease in production of 8½%); furs (1942–43), wild catch $2,012,746; farms $1,111,187; processed in Manitoba $997,733; processed in and exported from Manitoba, $7,990,961.

Communication.—In 1943 railways totalled 7,831 mi. Highways: surfaced, including trans-Canada, 8,745 mi. (gravelled, 8,208, bituminous, 500, concrete, 37). The government-owned telephone system had 88,257 subscriber stations, 131 exchanges and a total wire mileage of 325,237; it operated two radio stations, one of 15,000 watts at Winnipeg and one of 1,000 watts at Brandon. Maple Products. The production of syrup and sugar from the maple tree declined in 1943 com-

Maple Trees Tapped and Syrup and Sugar Production, by States

State	Trees Tapped		Sugar Made, lb.		Syrup Made, gal.	
	1943	1942	1943	1942	1943	1942
Vermont	3,800,000	4,000,000	354,000	320,000	1,072,000	1,310,000
New York	2,893,000	3,111,000	124,000	177,000	839,000	933,000
Ohio	786,000	854,000	2,000	5,000	193,000	177,000
Michigan	542,000	488,000	6,000	10,000	134,000	102,000
Pennsylvania	375,000	441,000	27,000	40,000	95,000	128,000
Wisconsin	283,000	333,000	2,000	2,000	48,000	90,000
New Hampshire	239,000	254,000	22,000	44,000	66,000	66,000
Massachusetts	198,000	200,000	26,000	28,000	66,000	64,000
Maine	131,000	128,000	7,000	8,000	27,000	27,000
Maryland	34,000	38,000	8,000	11,000	15,000	18,000

pared with 1942 chiefly because a smaller number of trees were tapped, due to the shortage of labour. Only 9,281,000 trees were tapped compared with 9,847,000 in 1942 and an average of 11,279,000 trees in the period 1932–41. The production as estimated by the U.S. department of agriculture was 2,555,000 gal. of syrup in 1943 compared with 2,915,000 gal. in 1942 and a 10-year average of 2,534,000 gal.

The sugar crop was 578,000 lb. in 1943 compared with 654,000 lb. in 1942 and an average of 800,000 lb. for the period 1932–41.

Marine Biology.

Biologists all over the world noted with profound regret the report[1] of the destruction of the Naples marine station and aquarium by the retreating German army as it evacuated the city early in October, 1943. The station, conceived by its founder and long-time director, Anton Dohn, was begun in 1872, at a cost of more than $100,000, and was built with the idea of establishing an institution, partly for the purposes of exhibiting in display tanks the beautiful and varied marine forms of the Mediterranean sea (the Aquarium), but mainly for the study of sea life under the best experimental conditions. The original station was a three-story stone structure with the aquarium of some 26 illuminated glass-fronted tanks occupying the first floor. The upper stories were given over to offices, library and laboratory rooms. Being one of the oldest and finest institutions devoted to Marine research on the European continent, it was the mecca for international biologists for more than 70 years. While the loss of the physical plant was considerable, the destruction of long-time type specimen collections and invaluable books, separates and manuscripts robbed marine biology of a rich heritage indeed, and one that can never be replaced.

Although seaweeds have been used for human and animal food for untold ages, exact scientific facts concerning their life histories and composition have been of very recent origin. A review of the status of many of the common seaweeds appeared in some detail in *Nature*.[2] In addition to fodder and fertilizer in rural provinces, quantities find their way into commercial uses. Out of potash and mineral extractions have come many diverse derivatives of a basic thick, shiny substance known as "algin," subsequent treatment of which with reagents results in the formation of a rubbery mass—a substitute for "hard rubber." Treated somewhat differently, a film similar to cellophane and suited for wrapping can be made. It can also be treated and drawn into thread which may be spun into a fabric known as artificial silk.

Treated yet again somewhat differently, it forms a white powder which serves well as a base for cosmetics, transparencies, plastics, auto polishes, creaming agents, as well as a suspension medium for powdered milk and cocoa. It is a source of glue, gel and mucilage. These and other facts prompt many issues of harvesting and transport as well as manufacturing and marketing of seaweeds.

In a word, the botanist, the ecologist, the biochemist, the technician and the financier will find new avenues over which to spread their talents.

Reports on the algae collected on the Swedish Antarctic and Magellanic expeditions[3] were available in 1943. Besides the well-known species of the "kelp belt," many unknown and hitherto undescribed species are listed.

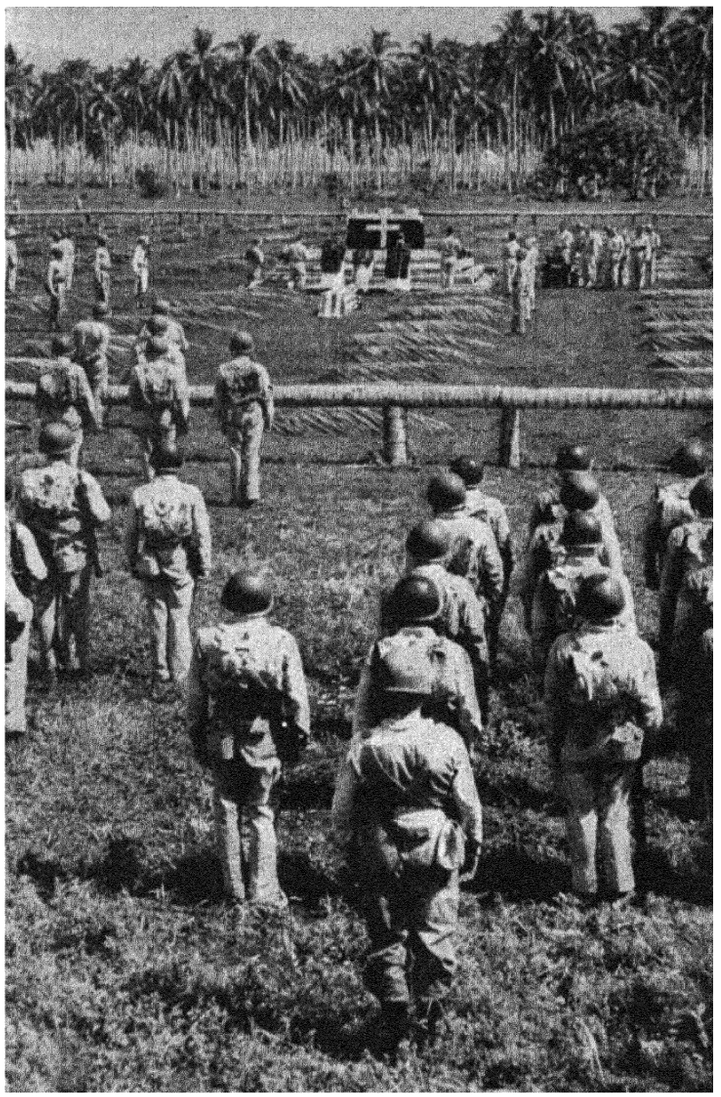
The red algae dominate the deeper waters, while the shore forms are mostly brown.

Workers in South Africa[4] successfully made agar from three abundant seaweeds *viz.*, *Gelidium cartilagineum* Gallion, *Gracilaria confervoides* Grer and *Sukria vittata* Ag.

Notes of alarm were sounded by the British government and two of its widely separated dominions, stressing the fact that overfishing of their adjacent waters must be rectified if serious consequences are to be averted. A paper before the Royal Society of London[5] called attention to the practice of overfishing (cod, haddock, hake, place, *et al.*) in the waters of the British Isles and the North sea. Technical improvements in ships and gear were seriously diminishing the supply. One suggestion to restore a biological balance was to enlarge the mesh so that immature specimens might not be caught. Another related to international agreements so drawn that each fishery area might be assured of a steady yield. A paper on fisheries research in Canada indicated that a similar series of problems confronted the Canadian government.[6]

The Australian Council for Scientific and Industrial Research[7] made public several bulletins, one of which reported that in spite of the war, which affected its people greatly, the sea-mullet was being overfished and suggested several steps to be taken to remedy the practice.

With the reconquest of the Mediterranean[8] it was hoped that the United Nations might immediately revive the fishing industry, institute modern methods of handling and thus relieve the transport system in feeding the undernourished and starving peoples of southern Europe.



It was thought that Sardinia's sardines and Sicily's tuna canneries might again be put into operation and expanded so that the output might be more adequate to the demands for sea food.

The director of the Marine Biological laboratory at Woods Hole, Mass., in his annual report stated among other things that only one-half of the normal number of students attended the current session.

Announcement was made by the Royal Canadian navy[9] of the development of "pink pills" for the prevention of or cure for seasickness. This remedy, while developed for use in the naval personnel, would no doubt in normal times be used extensively by the scientist as well as the layman where sea travel is imperative. Another discovery of a "sea-water de-salter" was announced by the U.S. Naval Medical Research institute. The new chemical briquet, about the size of a candy bar, quickly absorbs the salts and thus produces water that is fit to drink. Not only was such a de-salter to be used in case of shipwreck, but all overseas combat and commercial planes were to be provided with the new life-saving equipment since each briquet weighs only one-sixth as much as the drinking water it produces and occupies only one-tenth as much space. (*See* also ZOOLOGY.)

FUNERAL MASS for U.S. soldier[illegible] killed on Guadalcanal

Marine Corps. On Nov. 10, 1775, the first Continental congress established the marine corps as an integral part of the U.S. navy for duty afloat or ashore. The average strength is kept at about 20% of the naval personnel and on Dec. 15, 1943, it was about 325,000 total officers and enlisted men. Enlisted men are detailed from the selective service enrolment and from voluntary enlistment of men from 17 to 18 years of age. Officers are commissioned from graduates of the U.S. Naval academy and distinguished military colleges, from qualified enlisted men and from selected civilians for special duties. The ranks of officers and enlisted men correspond to those of the navy but the titles are those of the army from private to general.

Four distinct missions are assigned the marine corps: maintenance of marine detachments aboard battleships, cruisers and aircraft carriers as parts of the regular crews; maintenance of amphibious striking forces as parts of the fleets; garrison duties at naval stations at home and abroad; and provision of landing forces for the navy. The normal duty of the marines is with the navy but the statutes provide that any portion of it may be transferred to the army for temporary service.

The organization and training of the corps to meet these requirements includes infantry, artillery, aviation afloat and ashore, paratroops and tanks, and supply troops.

Fleet marine forces under the orders of the admirals of the fleets are made up of heavily armed and armoured triangular divisions specially outfitted and trained for overseas operations with a fleet or its task forces, provided with special transports, landing boats and amphibious tanks, with attached aviation squadrons.

During 1943, divisions were active in battle in the Southwest Pacific, especially the force under Lieut. Gen. A. A. Vandegrift at Guadalcanal and Bougainville islands with the naval forces of Admiral William F. Halsey, Jr., and the force under Maj. Gen. Holland M. Smith with the naval forces of Admiral Chester W. Nimitz in the Gilbert Islands and the capture of Tarawa.

To train the marines for their varied duties large recruit training stations are operated at Parris Island, S.C., and San Diego, Calif., and large divisional training centres are located at Camp Lejeune, New River, N.C., San Diego, Calif., and Quantico, Va.

Aviation units for training are maintained at these stations and also with the naval aviation training centres ashore and with naval aviation afloat.

On Dec. 31, 1943, Lieut. Gen. Thomas Holcomb was transferred to the retired list after seven years' service as commandant of the marine corps and he was succeeded in that office by Lieut. Gen. Alexander Archer Vandegrift. Upon retirement the outgoing commandant received promotion of one grade giving him the rank of general, the highest rank ever held by a marine officer.

Marine Corps Women's Reserve.—During 1943 a force of women was authorized for service in the marine corps reserve to be raised by voluntary enlistment and to be trained for service at shore stations of the corps in suitable positions, relieving men of the corps for active field service.

This women's reserve, consisting of 500 officers and 12,000 enlisted women (Dec. 15, 1943), was commanded by Lieut. Col. Ruth Cheney Streeter, the authorized strength for July 1, 1944, being 1,000 officers and 18,000 enlisted. The main training station for the force is at Camp Lejeune, New River, N.C.

They were being assigned to clerical and administrative work in offices at headquarters of the corps and other shore stations, to the ground crews of marine aviation servicing, overhauling and repairing planes and packing parachutes, and driving and repairing trucks and motor cars. They were also relieving men of the marine corps at supply depots and stations and as trumpeters and drummers, and were to be assigned to other duties when training made them available.

Marine Insurance: *see* INSURANCE.

Market Gardening. The total production of vegetable crops for the fresh market in the United States, including potatoes and beans, was the largest on record in 1943. This increase was due to the large crops of potatoes and beans while the totals of other vegetable crops grown for market and processing was about 10% less than in 1942, but more than for any previous year except 1941.

The total commercial production of truck crops for shipment to the fresh market was estimated by the United States department of agriculture at 6,508,000 tons for 1943 which was about 7% less than was produced in 1942, but 4% more than the ten-year average. Much of the planted acreage was lost due to freezes and floods. The smaller commercial supplies of fresh vegetables compared with 1942 were offset to a large extent by greatly increased production in victory gardens. The smaller supplies and high consumer purchasing power resulted in a higher level of prices than in 1942 by about one-third. Temporary ceilings were placed on several fresh vegetables at certain markets and the highest prices were in those products not under the ceilings.

In view of the strong demand, the War Food administration called for an increase of about 6% for the crops of 1944, though it appeared doubtful if the production could be increased without

U.S. Production of Truck Crops for Fresh Market, 1943 and 1942

a very good season and high yields. An increase in victory gardens was also suggested. The goal for 1944 was set at 22,000,000 gardens compared with 18,000,000 in 1943. With better supplies of fertilizer and the experience of gardeners, better returns were expected. (*See* also LETTUCE; POTATOES; TOMATOES; TRUCK FARMING.) (J. C. Ms.)

Marmon, Howard C. (1876–1943), U.S. automobile manufacturer, was born May 24 in Richmond, Ind. After graduating from the University of California in 1898, he entered his father's machinery factory, then established his own automobile factory. He designed the first Marmon automobile in 1902, and shortly afterwards became vice-president and chief engineer of the Marmon Motor company. In the early years of motor racing, Marmon's cars took many top honours. His Marmon Wasp won the first 500-mile international sweepstakes on the Indianapolis Speedway in May 1911, making an average of 74.61 miles an hour for the distance. During World War I, he served on several aeroplane missions to Europe and was adviser on the construction of the Liberty aeroplane motor. He died at Fort Lauderdale, Fla., April 4.

Marriage and Divorce. There were two opposite social trends of greatest concern to the family. On the one hand there was evidence that the war stress affected the family even more in 1943 than in 1942 and that the strain was cumulative as it influenced family disorganization. As a result of this the year 1943 brought also wider public realization of the difficulties of families and more effort among U.S. social leaders to strengthen the home life of the nation that it might successfully meet its stress. The most spectacular indication of the first trend was the increase of juvenile delinquency, especially that of the teen-age girl. Although this problem had other causes than the breakdown of family functioning, it was chiefly an expression of the demoralization of many individual homes. J. Edgar Hoover's report on arrests for the first six months of 1943 showed an increase in the delinquency of girls under 21 years of age, of 64.7% over that of the first half of 1942. More impressive was the fact that there were more arrests during this six months' period than for the entire 1941 calendar year. For offenses against common decency the number of girls under 21 years of age arrested during the first half of 1943 increased 89.5%. From every section of the nation, especially from cities and communities near war camps, social workers reported a noticeable increase in the problem of maladjustment among youth and especially among girls. The most startling evidence of this was the increase in reported cases of syphilis among boys and girls between 15 and 20 years of age. The New York Health department reported that primary and secondary syphilis increased 37% during 1942 in this group as compared with the period 1939–41. The child-labour situation also revealed effects of the war that were greatly influencing family life and the conduct of youth, especially when minors in war work earned as much or more than their fathers. During 1943, 44 legislatures met in regular sessions. Sixty-two acts were passed affecting the employment of minors in 27 states. Fifty-four of these enactments contained backward steps, although 40 of these were limited to the war period. In addition two of these states and one other issued 15 administrative rulings, all but one of which relaxed somewhat the previous child-labour regulations.

The constructive trend was especially evident along the lines of maternal and infant care. It was estimated that there would be approximately 3,000,000 births during 1943, the highest number of births, although not the highest rate of increase, in the history of the nation. Retailers reported their sale of maternity dresses during 1943 would be from 50 to 100% greater than for 1942. Congress recognized the nation's responsibility for the health of expectant mothers and their babies by an appropriation, later increased, which provided allotments for the care of the wives and infants of men serving in the lower grades of military service. The need of this appeared when a comparison was made between the states in their provision for the care of the pregnant woman and her child. For example the proportion of cases not having the care of a physician ranged from practically none in some states to approximately half in Mississippi. There were similar differences in the proportion of non-hospitalized cases extending from 6% in Connecticut to 83% in Mississippi. The Children's bureau program for community action for children in war time had the following six objectives:

1. A well-baby clinic in every community.
2. Care for children of employed mothers.
3. School lunches in every school.
4. Schooling for every child.
5. Play and recreation programs in every community.
6. Employment safeguards for every boy and girl.

According to the statistical bulletin of the Metropolitan Life Insurance company, the number of marriages during 1943 would probably total 1,725,000, 75,000 less than the peak number of 1942. This would be the first decrease since 1938.

It appeared that the decline in the war marriage boom apparent in New York city as 1943 came to an end would prove true for the nation as a whole. Licences were granted in 11 months to only 71,250 couples, the lowest in four years. A comparison of the marriage rates of World War I and II based on New York city populations of 5,400,000 and 7,377,300 follows:

Year	Number of Marriages	Rate (in 1,000)
1917	59,210	11.0
1918	56,733	10.3
1941	83,012	11.0
1942	81,454	10.8

The prevailing divorce confusion in the United States was further clouded by a chancery court decision in New Jersey which refused, in spite of the ruling of the United States supreme court the previous December that all states must recognize divorces granted in other states, to recognize a Nevada divorce decree on the basis that the six weeks' residence requirement was not a legal and honest domicile in Nevada. On Dec. 13, Justice Morris Eder of the New York supreme court made a similar ruling holding that when a husband or wife establishes a Nevada residence merely for the purpose of obtaining a divorce the intent of the domicile is fictitious and the decree therefore illegal. Regarding the United States supreme court decision of 1942 in the

[2]Sixteenth Census of the United States, 1940, p. 5.

North Carolina versus *Williams* case, he stated, "I find nothing in the prevailing opinion of the court which overrides the existing rule, that the full faith and credit clause does not estop the court in which it is sought to assert the judgment of the foreign court, from inquiring into and investigating its validity to ascertain and determine if it is entitled to be given valid recognition under that provision." An authoritative symposium on the law of divorce by Roscoe Pound appeared in the *Iowa Law Review,* Jan. 1943.

Missouri, Nebraska, Idaho and Wyoming in 1943 increased to 30 the number of states requiring some sort of premarital examination for venereal disease, while Idaho, Nebraska, Georgia and Kansas by requiring prenatal examinations also increased the number of states having laws to protect the unborn against syphilis to 30. The state of New York strengthened its premarriage examination law by providing that the statement of the physician making such tests, "shall include the name and address of the applicant; a statement that a serological test for syphilis was performed; the date on which the specimen was taken and the name and location of the laboratory in which such test was made." The physician's statements must accompany the application for a marriage licence. The bill provides, however, that the result of the serological test shall not be included in such statement but that a detailed report of the laboratory test when positive shall be filed with the local health authorities and held in "absolute confidence" and not open to public inspection. The new California law allowing divorce for more than three years' duration of insanity, passed in 1942, went into effect on Aug. 4, 1943. The spouse seeking the divorce, however, must make satisfactory arrangements for the support of the insane partner for life.

American religious leadership throughout the year at various church conferences recognized the strain on family life during war time and emphasized the need of conserving both marriage and the family. At the 54th Triennial General convention of the Protestant Episcopal Church, a report was submitted proposing the revising of the divorce regulations to permit the diocesan bishop to grant permission for a divorced person to remarry after consulting a pastor or priest, a lawyer and a physician. This change, approved by the lay delegates, was defeated by a narrow margin in the clerical order of the Church's house of deputies, 38 voting "Yes," 32 "No," and 9 divided. A majority vote is required to authorize the change.

Although interest in problems of marriage and the family was never greater, war conditions during 1943 prevented some of the conferences which otherwise would have been held, such as the National Conference for Family Relations, which was to have been held at Cleveland, and the Annual April Conference on the Conservation of Marriage and the Family at Chapel Hill.

Representative of gatherings that were held are the Iowa Conference of Family Relations at Cornell College, the Pacific Northwest Conference of Family Relations at the University of Washington, the Family Relations Conference of Northern California at Berkeley, the Second Annual Conference of Negro Colleges on Conservation of Marriage and the Family at the State College for Negroes at Durham, N.C., the Institute for Family and Child Care Services at Vassar college, and the Annual Institute of the Child Study Association of America at New York, having as its subject, "The American Family Faces the Second War Year."

Tables I and II reveal the present family population of the United States in comparison with the four preceding decades, and the median size of family in comparison with the situation of ten years ago.

(*See* also CENSUS, 1940.) (E. R. G.)

Marshall, George Catlett (1880–), U.S. army chief of staff, was born at Uniontown, Pa., on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901, after completing his studies at Virginia Military institute and the Army Staff college, he advanced through the grades to brigadier general in 1936. In 1902 and 1903 he served in the Philippines, also from 1913 to 1916. He was with the American expeditionary forces in France in 1917, on the general staff of the 1st division, as chief of operations of the 1st army and as chief of staff of the 8th army corps. After the war he was aide-de-camp to Gen. John J. Pershing for five years. From 1924 to 1927 he was stationed in China; in 1933 he was appointed commander of the 8th infantry and in 1936 commanding general of the 5th brigade. On July 1, 1939, Marshall took office as acting chief of staff. The appointment was made permanent on Sept. 1, the day that Hitler invaded Poland, and Marshall was made a full general. In the war years following he demonstrated remarkable ability to co-ordinate diverse ele-

ments and points of view, while retaining the goodwill of practically everyone, including members of congress. He was an early supporter of the Burke-Wadsworth selective service bill, and after its enactment into law directed and co-ordinated the enormous load of activity that attended the first peacetime military conscription in U.S. history. In 1941 he endorsed aid to Britain. When war actually came on Dec. 7, 1941, Marshall had under his command an army of 1,500,000 green soldiers. In his biennial report, released Sept. 8, 1943, he revealed that there were 8,000,000 U.S. soldiers, many in actual fighting on fronts all over the world. Later in the month he stated that the army planned to have an estimated 2,250,000 men serving outside the U.S. by the end of 1943, and 5,000,000 by the end of 1944. Late in 1943 it was widely rumoured that Marshall would be replaced as chief of staff and given the position of supreme commander of Anglo-American armies in Europe, but the appointment was given to Gen. Dwight D. Eisenhower. Marshall attended the Casablanca, Quebec, Cairo and Tehran conferences during the year. After he left Tehran, he returned to the U.S. by way of Asia and the Pacific, where he conferred with high officers in New Guinea, the Solomons, Hawaii and elsewhere. He completed his round-the-world trip of more than 30,000 mi. on Dec. 23.

Marshall, Tully (1864–1943), U.S. actor, was born William Phillips in Nevada City, Calif., on April 13. He left college to join a vaudeville troupe in San Francisco, later graduating to the legitimate stage. In 1887 he went to New York city, where he played minor roles with Modjeska and E. H. Sothern. He scored his greatest footlight success in *The City* (by Clyde Fitch), which enjoyed a two-year run in New York city, 1909–11. He also directed and starred in two plays written by his wife, Marion Fairfax, *The Builders,* 1907, and *The Talker,* 1912. He left Broadway for Hollywood in 1915, "stole the show" in the picturization of Emerson Hough's *The Covered Wagon* and thereafter was in wide demand as a feature player. Because of his extensive stage experience, Marshall easily bridged the changeover from silent to talking pictures. In his later years, he appeared in such motion picture hits as *Black Fury, A Tale of Two Cities, Stand In, Ball of Fire* and *This Gun for Hire.* He died at his home in Encino, Calif., March 10.

Martinique: *see* FRENCH COLONIAL EMPIRE.

Marvin, Charles Frederick (1858–1943), U.S. meteorologist, was born Oct. 7 in Putnam, O. He graduated from Ohio State university in 1883 and the next year joined the weather forecasting service as civilian member of the army signal corps. He was chief of the U.S. weather bureau from 1913 until his retirement in 1934. During his long career he invented many meteorological instruments, including devices for measuring and automatically recording rainfall, snowfall, sunshine and atmospheric pressure. In addition he did notable work in the investigation and standardization of the anemometer for measuring wind velocities and pressure. He was among the first to start a special weather report service for pioneering transatlantic aviators and was the inventor of the clinometer, to determine the exact height of clouds, especially valuable to airports. He was the author of numerous papers on meteorology and simplification of the calendar. He died in Washington, June 5.

Maryland. A south Atlantic state and one of the original 13 states, popularly called the "Old Line" state. Total area 10,577 sq.mi., land area 9,887 sq.mi., water 690 sq.mi. Population (1940) 1,821,244; urban 1,080,351, rural 740,893; white 1,518,481; nonwhite 302,763. Capital, Annapolis (pop. 13,069); other cities: Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,802).

History.—The governor, Herbert R. O'Conor, was re-elected in 1942 for a second term. The Maryland legislature met for its biennial session, Jan. to April, 1943. Outstanding bills passed included a constitutional amendment reorganizing the court of appeals—as recommended by the Bond Committee report. The juvenile court of Baltimore city was reconstituted so that all juvenile delinquents would be dealt with in the department of welfare. Provision was made for the construction of two chronic disease hospitals after the war. The state conservation program was strengthened by passage of a bill providing for a co-operative crab-conservation program with Virginia and by the defeat of two bills, one to open the Potomac to oyster dredging and the other to break down the fin-fish conservation program.

The fiscal system was strengthened by a report by a special committee which led to legislative scrutiny of the budget and a revised budget estimate by the governor providing a carefully integrated fiscal program. A bill providing a bonus for school teachers and state employees was passed. An emergency measure reducing the income tax 33% was passed for 1942 and a reduction of 50% was made for the 1943 tax.

Education.—In 1943 there were 965 elementary and occupational (Baltimore only) schools in Maryland including 330 Negro schools. The total elementary enrolment was 205,016, of which 45,960 were Negro. Teaching staff 5,290, including 1,237 Negro. There were 214 secondary and vocational schools (including 39 Negro) with an enrolment of 75,550 (including 11,730 Negro) and a teaching staff of 3,925 of which 977 were Negro.

Public Welfare, Charities and Correction.—General public assistance including foster home care was given in Oct. 1943 to 3,916 persons (cost, $1,504,683 for Jan.–Oct. inclusive); old age assistance to 13,461 ($3,056,488); aid to needy blind, 477 ($127,064); aid to dependent children 8,919 ($1,285,247). Unemployment compensation benefits amounted to $824,544.

Correctional institutions and the average number of inmates in 1943 were as follows: Maryland penitentiary (1,172); Maryland house of correction (1,145); Maryland state penal farm (396); women's prison of Maryland (118). There were also four juvenile institutions.

Communication.—The State Roads commission expended during the period from Oct. 1942, to June 30, 1943, a total of $11,314,837. The total mileage maintained by the state was 4,362; connecting links not state-maintained 99.95. An important highway construction project of 1943 was a full cloverleaf grade separation at intersection of state Route 20 and state Route 150, to expedite traffic movement to industrial areas of Sparrows Point and Middle River. On Dec. 31, 1941, there were 1,361 mi. of railroads in Maryland. There were 21 airports and 5 seaplane ports in the state in 1941. Telephones in service in Maryland numbered 387,732 as of Nov. 1, 1943.

Banking and Finance.—On June 30, 1943, there were 112 state banks and trust companies and branches with total deposits of $590,555,744 and total resources of $644,203,176; and there were 11 mutual savings institutions and total deposits of $248,199,796 and total resources of $278,327,297. There were 63 national banks with total deposits of $581,861,000 and total resources of $618,027,000. State appropriations for the fiscal year ending June 30, 1943, were $55,371,982.84; expenditures $45,366,830.78; bonded indebtedness $33,619,000; surplus in general funds $12,600,932. These figures are for nine months only, since Maryland changed the end of its fiscal year from Oct. 31 to June 30.

Table I.—*Leading Agricultural Products of Maryland, 1943 and 1942*

Crop	1943 (est.)	1942	Crop	1943 (est.)	1942
Corn, bu.	12,744,000	16,344,000	Tame hay, tons	529,000	553,000
Wheat, bu.	4,935,000	5,986,000	Potatoes, bu.	1,800,000	2,019,000
Oats, bu.	1,012,000	1,110,000	Tobacco, lb.	19,525,000	31,008,000
Barley, bu.	1,800,000	2,365,000			

Agriculture.—Maryland's cash income from farm products in the months from Jan.–Sept. 1943, totalled $127,529,000, of which $57,883,000 represented the income from crops and $69,646,000 that from livestock and livestock products. The 1943 figure was $32,585,000 higher than that for the same period in 1942, during which time the total cash income from crops reached only $43,731,000, and that from livestock and livestock products $51,213,000.

Manufacturing.—Manufacturing industries reporting to the state commissioner of labour and statistics showed a per cent change in employment of +4.6 and +20.3 in combined payrolls from Oct. 1942 to Oct. 1943. Average weekly earnings amounted to $50.33 and average hours worked per week amounted to 46.7 hours.

Mineral Production.—The total value of mineral production in 1941 was $17,291,523, as compared with $12,605,701 in 1940. Leading mineral products and their values are shown in Table II.

Table II.—*Leading Mineral Products of Maryland, 1941 and 1940*

Product	1941, Value	1940, Value	Product	1941, Value	1940, Value

(C. B. S.)

Massachusetts.

A north Atlantic state of the U.S.A., admitted to the union Feb. 6, 1788. Area, 8,093 sq.mi., including 254 sq.mi. of inland water; pop. (1940) 4,316,721, of which 3,859,476 was urban, 457,245 rural; 4,257,596 white, 55,391 Negro. Capital, Boston (770,816). Other principal cities: Worcester (193,694); Springfield (149,554); Fall River (115,428); Cambridge (110,879); New Bedford (110,341); Somerville (102,177); Lowell (101,389) and Lynn (98,123).

History.—Officers of the state in 1943 included: Governor Leverett Saltonstall (Rep.), who was inaugurated for his third two-year term on Jan. 6; lieutenant governor, Horace T. Cahill (Rep.); secretary of state, Frederic W. Cook (Rep.); treasurer and receiver general, Francis X. Hurley (Dem.); auditor, Thomas J. Buckley (Dem.); attorney general, Robert T. Bushnell (Rep.).

During the 1943 session of the legislature, which meets biennially, the senate consisted of 26 Republicans and 13 Democrats, and the house of representatives of 139 Republicans and 97 Democrats. Legislation in 1943 was largely concerned with provisions to facilitate the eventual postwar readjustment. Five special commissions, requested by the governor, were directly employed in advance preparation for the problems of reconversion to a peacetime economy. The Post-War Readjustment committee devoted itself to working with private industries of the state in their postwar planning. The Commission on Emergency Public Works assembled and evaluated plans for public works by the state itself and stimulated cities and towns to plan projects. The Post-War Highway commission studied the order of priority in which projected new highways should be undertaken. A committee on transportation studied the revamping of the Boston metropolitan transportation system. The committee on veterans' rehabilitation and re-employment was charged with the specific task of assisting returning veterans. The legislature also set up its own legislative commission on postwar rehabilitation to act as a liaison agent between the executive and the legislative branches in dealing with the problems of returning veterans.

The financial position of both the state and municipal governments in Massachusetts at the end of 1943 was strong. The net direct debt of the state government by Nov. 30, 1943, had been reduced to $5,663,861 from a peak of about $40,700,000 in 1938. The combined debt of Massachusetts cities and towns at the close of 1943 stood at less than $215,000,000, a drop of more than $100,000,000 from the 1932 peak of $316,484,599.

Education.—In 1943 Massachusetts maintained 1,887 elementary school buildings, with 358,459 pupils and 13,713 teachers; 169 junior high school buildings, with 92,948 pupils and 4,010 teachers; 271 senior high school buildings, with 139,638 pupils and 6,754 teachers; 9 teachers' colleges, with 1,917 students and 313 teachers; and the State college at Amherst, with 1,484 students, including 750 army air force cadets; and 249 members of the professional staff.

Massachusetts maintains the State college at Amherst, the Massachusetts Maritime academy and the Art school in Boston, three textile schools, and a teachers' college at Bridgewater, Fitchburg, Framingham, Hyannis, Lowell, North Adams, Salem, Westfield and Worcester.

Public Welfare, Charities, Correction.—State welfare aid (totals estimated on the basis of 11 months ending Nov. 30) reached an average of 119,410 cases with an approximate expenditure of $46,460,000, a drop of 106,950 cases, and of approximately $18,000,000 from the 1942 figures. Types of assistance were: old age, $29,157,000; aid to dependent children, $6,826,000; general relief, $5,700,000; aid to the blind, $341,000; child guardianship, $2,065,000; unemployment compensation, $2,370,196.

The five state correctional institutions in 1943 included a state prison, a state prison colony, a reformatory for men, a reformatory for women, and a state farm including accommodations for the criminally insane.

Communications.—Total mileage of highways in 1942 was 23,516 of which 17,439 mi. were rural. State highway expenditures in 1942 were $10,903,000, of which $8,517,000 was for construction, maintenance and administration. Railroad mileage in operation in 1942 was 4,234, a figure which included sidetrack and privately owned industrial track. There were 1,072,197 telephones in use in Sept. 1943.

Banking and Finance.—Of the 902 state banking institutions in 1943, 191 were savings banks, 181 co-operative banks, 68 trust companies and 462 credit unions. In addition, there were 124 national banks operating in the state. Total banking deposits were $6,649,920,000 and total banking assets $8,503,508,000. The 26 federal savings and loan associations had resources of $144,718,508, on Dec. 31, 1943.

State government receipts for the year ending Nov. 30, 1942, were $132,624,093; and expenditures for the same period were $125,411,797. The state debt on Nov. 30, 1943, was $6,959,300 (gross direct), $5,663,861 (net direct).

Agriculture.—Gross income of agricultural production in 1942 was $118,929,000, of which $42,940,000 was from crops, $75,179,000 from livestock and $810,000 from government payments. Cash income from crops in 1942 was $38,772,000 and from livestock $71,107,000. Fish landed in Boston in 1943 totalled 143,-

Table I.—*Principal Agricultural Products of Massachusetts, 1943 and 1942*

Crop	1943 (est.)	1942
Tobacco, lb.	8,185,000	9,024,000
Cranberries, bbl.	485,000	560,000
Apples, commercial, bu.	2,228,000	3,400,000
Potatoes, bu.	3,375,000	2,945,000
Asparagus, crates	149,000	158,000
Onions, bags	258,000	338,000
Hay, all, tons	568,000	582,000
Corn, grain, bu.	336,000	308,000
Corn, silage, tons	308,000	308,000

450,493 lb. and were valued at $12,656,150.

Mineral Production.—The production of principal minerals in 1942, in short tons, was: coke and by-products, 1,176,400; lime, 87,537; stone, 1,800,600; sand and gravel used, 5,179,419.

(L. SL.)

Massachusetts Institute of Technology.

During 1943, the institute carried on war research and development work under 162 contracts, of which approximately one-third were with industrial firms and two-thirds with government agencies.

The institute's financial operations during its fiscal year 1942–43 involved an expenditure of about $23,000,000, as compared with prewar annual expenditures of about $4,000,000. The war activities of the institute had required the addition to its educational and research plant of 450,000 sq.ft. of floor space by new construction and 260,000 sq.ft. by rental.

To meet conditions created by the war and to co-ordinate with the army and navy college training programs, the institute in June 1943 adopted a new academic program for all civilian students consisting annually of three consecutive terms of approximately 16 weeks each. In accordance with this program a new civilian freshman class was admitted in June. Without any relaxation of admission standards, this new freshman class totalled 580, only 20 less than the normal quota of 600 for entering classes. For statistics of enrolment, endowment, faculty members, etc., *see* UNIVERSITIES AND COLLEGES. (K. T. C.)

Material Coordinating Committee (U.S. and Canada): *see* CANADIAN-U.S. WAR COMMITTEES.

Mathematics.

There are normally two reliable criteria for the degree of mathematical activity in the United States: the number of papers presented at meetings of the American Mathematical society, and the quantity of research published in the various journals. A lack of papers presented in 1943 was not immediately reflected in the amount of publication due to a backlog of papers on hand, but a definite drop in publication appeared to be imminent.

In spite of this rather gloomy prediction it is gratifying to be able to observe that the American Mathematical society and the Mathematical Association of America were united in a policy which called for a continuation of their meetings. This policy was also that of the English societies.

Moreover, this prediction was no indication of a genuine lack of mathematical activity in these abnormal times, for there was a tremendous amount of war work being done by mathematicians. All such research was to remain unpublished for the duration.

Mathematical activities for 1943 will be summarized in two parts: addresses and publications.

The speaking event of the year was the Colloquium lectures sponsored by the society. This year the lectures were delivered by Professor E. J. McShane on "Existence Theorems in the Calculus of Variations." His book was awaited with interest. At the annual meeting of the society the retiring presidential address, "New Settings for Topology in Analysis," was delivered by Professor Marston Morse. It is almost impossible to speak of significant lectures abroad except to mention that Professor M. H. Stone, president of the American Mathematical society, lectured extensively throughout South America.

Publications are more difficult to enumerate, but along with other results which attracted attention are the following. It was shown that the theory of group extensions is a powerful tool in the study of homologies in infinite complexes and topological spaces (Samuel Eilenberg and Saunders MacLane). Results were announced and published along the lines of H. Hopf's classical discovery on relations between the fundamental group and the second Betti group (Samuel Eilenberg, Saunders MacLane and R. H. Fox). Progress was made on the Kline problem—a characterization of the sphere (D. W. Hall). Important work was done on the theory of surfaces of zero area (T. Radó). A new development in surface theory was the definition of an essential area (P. V. Reichelderfer). Kolmogoroff's celebrated law for the iterated logarithm was generalized (W. Feller). The fundamental theorem on the density of sums of sets of positive integers was proved after having remained an unsolved problem for the past decade (H. B. Mann, simplifications by E. Artin and P. Scherk). A detailed proof of results on the Artin-Riemann hypothesis was expected to appear soon (André Weil). It was shown that all sufficiently large integers can be represented as the sum of seven cubes (U. V. Linnik). Results on trigonometric sums were sharpened (I. M. Vinogradow).

Several prizes were awarded. Professor Jesse Douglas won the Bôcher prize for his research in analysis. The Sylvester medal was presented to Professor J. E. Littlewood for his discoveries in the analytic theory of numbers.

An important new journal, *Quarterly of Applied Mathematics*, appeared under the sponsorship of Brown university.

A partial list of new books follows. *The Problem of Moments*, J. A. Shohat and J. D. Tamarkin. *The Theory of Rings*, N. Jacobson. *Vectors and Matrices*, C. C. MacDuffee. *Introduction to Non-Linear Mechanics*, N. Kryloff and N. Bogoliuboff. *Meromorphic Functions and Analytic Curves*, Hermann Weyl. *Eratosthenian Averages*, A. Wintner. Several important volumes were reprinted in the public interest by authority of the Alien Property custodian.

Meat.

The total output of all meats in the United States in 1943 (not including poultry) was estimated to be 24,000,000,000 lb., 13% above 1942 and 50% above the average of 1935–39, which was 16,182,000,000 lb. Of this total for 1943 about 15,815,000,000 lb. was consumed by civilians and 6,330,000,000 lb. by noncivilians, with the remainder going into reserve and carryover into 1944. Military and lend-lease requirements amounted to about 25% of the total production. The amount available for civilians was about 128 lb. per capita on the average, which was almost 6 lb. less than the average for 1942.

The large pig crop of 1943 with heavy fall marketing provided a total pork production of 13,082,000,000 lb., the largest on record, and after about one-third of the total went to noncivilian uses left about 64 lb. per capita, or 5 lb. more than in 1942.

Of beef the total production was estimated to be 8,780,000,000 lb. or 325,000,000 lb. more than in 1942, while the production of veal dropped to about 1,000,000,000 lb. This total, less the increased requirements for military and lend-lease uses, left only about 60 lb. per capita for civilians, compared with 68 lb. in 1942 and an average consumption of 63 lb. in the 5-yr. period 1935–39. The goal for 1944 was set at about 11,800,000,000 lb. of beef and veal to meet an expected increase of noncivilian uses.

The total production of lamb and mutton was estimated to be 987,000,000 lb. in 1943, compared with 1,036,000,000 lb. in 1942. Of the total of 987,000,000 lb., about one-third or 268,000,000

TWO THOUSAND BROOKLYN BUT[illegible]nable to obtain meat from wholesale houses, staged a near riot March 25, 1943, before mounted police dispersed them

lb. was required for noncivilian uses. The amount remaining for civilians would provide about 5.2 lb. per capita, compared with an average of 6.7 lb. consumed in 1935–39.

The large cold storage stocks of frozen and cured meats in Dec. 1943 reflected the heavy production of the year. Total stocks of meats on Dec. 1 amounted to 703,775,000 lb., compared with 603,243,000 lb. in 1942 and 499,758,000 lb. as the average of 1932–41. Of this total 183,096,000 lb. was beef, 376,072,000 lb. was pork and 31,074,000 lb. lamb and mutton. Heavy shipments were being made to the army and under lend-lease, so that the normal indications of the stored stocks were obscured. Under reversed lend-lease, Australia and New Zealand shipped the

Livestock Slaughter in Plants under Federal Inspection (January to October), 1943 and 1942

	1943 numbers	1942 numbers
Hogs	48,893,000	42,096,000
Sheep	18,735,000	17,324,000
Cattle	9,237,000	10,347,000
Calves	4,050,000	4,783,000

American forces in the Pacific area a large amount of meat, amounting to 61,484,000 lb. from Australia and 49,650,000 lb. from New Zealand. (*See* also BACON; CATTLE; HOGS; LIVESTOCK; POULTRY; RATIONING; SHEEP.) (J. C. Ms.)

Medicine.

Penicillin.—Medical attention in 1943 was focused particularly on penicillin. Twenty-two pharmaceutical companies were licensed by the Office of Scientific Research and Development, through its committee on research, and by the War Production board to manufacture and distribute this substance. The limitations on supply made it necessary to restrict the product to the armed forces and to certain experimental studies.

Announcement was made that a technique had been developed for growing penicillin on surgical gauze, so that it could be grown by any laboratory and applied in this way. However, subsequent studies indicated that the necessity for standardization and sterilization of products applied to wounds made it impossible to recommend this procedure. For medical uses, penicillin, which is a form of mould, must be grown, dried, standardized, and then used, either as a powder directly on wounds or as a solution by injection into the muscles, the blood, or the spinal fluid.

Penicillin is especially effective in streptococcic, gonococcic and meningococcic infections. Its outstanding use was its application to persistent infections of the bones in osteomyelitis, particularly of the jaw and the head. Cases of gonorrhoea which were resistant to treatment with sulfonamides were successfully treated with penicillin. Announcement was made that penicillin can change a positive Wassermann test in syphilis to negative in a short time. The Wassermann test remained negative in many such cases for several months. The ultimate value would be determined only when postmortem examinations became possible on persons who had been cured of syphilis by this method. Announcement was made that subacute bacterial endocarditis, a condition heretofore considered almost invariably fatal, had been treated successfully with a combined injection of heparin, a drug which dissolves blood clots, and penicillin. (*See* PENICILLIN.)

Anaesthesia.—Especially significant in 1943 were advances in anaesthesia, including particularly spinal anaesthesia and the injection of anaesthetic substances directly into the blood. The navy adopted these techniques in place of inhalation anaesthesia.

Obstetrics.—Continued development of continuous caudal analgesia in childbirth made possible the report of 10,000 cases with a low incidence of failure and a small number of complications. Through the facilities of the United States Public Health service educational courses were established for training physicians and anaesthetists in this technique.

Malaria.—Medical enemy No. 1 in the war was malaria. Research indicated a technique for control, involving the use of quinine, atabrine and plasmochin. American production of atabrine rose from 50,000 tablets per year to more than 2,000,000,000 tablets annually. The United States assumed largely the burden of supplying all of this drug to the United Nations. Investigators continued to search for a new drug capable of preventing malaria, also for a new technique to control the mosquito.

An insect repelling bomb was produced and was in 1943 available to the forces of the United Nations. The insect-repellent agents include freon, used in household refrigeration, and pyrethrum. So great was the demand for this material that the use of the insect repelling bomb was limited to the armed forces

until after the war.

Sulfonamides.—New investigations showed that the sulfonamides are efficient in controlling meningitis, bringing the total number of deaths from 17 for each 100 cases to 3 for each 100 cases in various epidemics. Physicians in one large army camp stopped the spread of an epidemic by giving regular doses of sulfathiazole to all of the soldiers who might be exposed to the infection.

Deaths from pneumonia in the army were less than 1%. In civilian life the number of deaths was reduced from 27 out of each 100 cases to 7 out of each 100 infected.

Doctors tested a mixture of sulfadiazine in chewing gum for infections in the throat, but objection was made because of the possibility of sensitizing people to the drug. Sprays containing mixtures of sulfadiazine and a constricting agent were recommended for the treatment of colds. Experts were convinced that the sulfonamide drugs are not especially efficient against the virus of colds. They would, however, prevent the growth of secondary germs, like the streptococcus.

New sulfonamides were developed, including sulfamerazine, which was said to be less toxic than previous forms, and which was recommended particularly for use where there might be complications related to the kidney. Research showed that baking soda or sodium bicarbonate taken previous to the giving of the sulfonamide drugs tends to prevent such kidney complications.

The sulfonamides were found to be especially effective in the treatment of dysenteries and diarrhoeas. The most frequently used sulfa drug for general purposes was sulfadiazine. Other forms undergoing experimentation included sulfasuxidine and sulfapyrazine.

Another derivative of the sulfonamides, called diasone, was advanced for use in tuberculosis, after it was shown that it could successfully control experimental infections with tuberculosis in guinea-pigs. Experiments also continued with another derivative, called promin, advanced for tuberculosis.

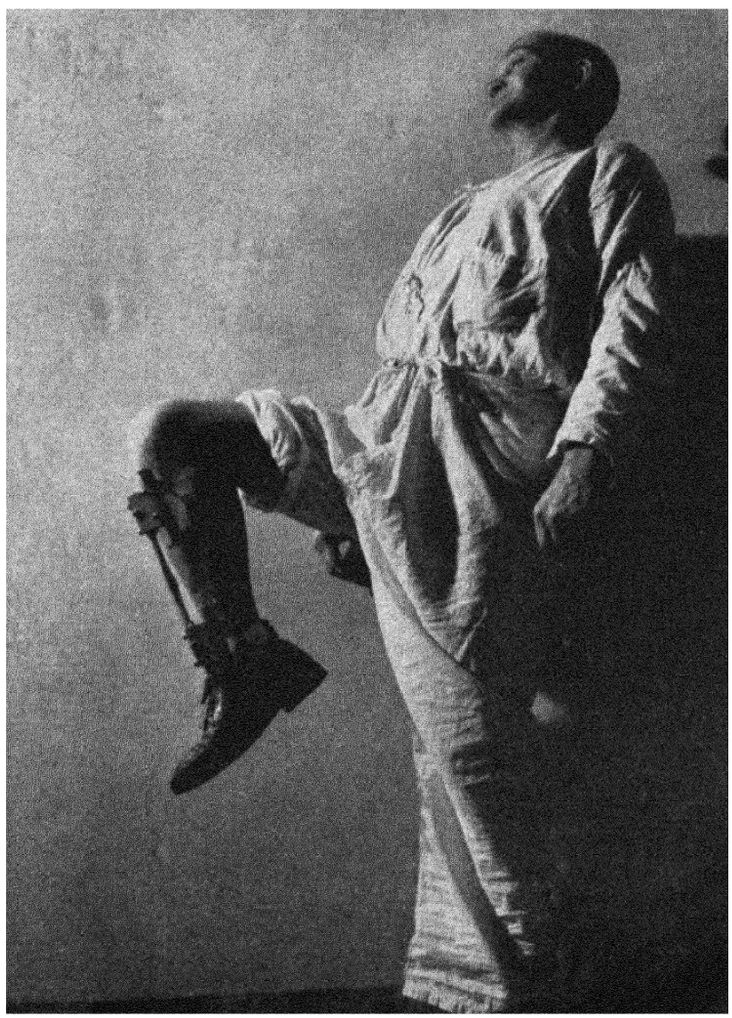
The rate for tuberculosis rose all over the rest of the world, and even slightly in some portions of the United States. Particularly important in the attack on tuberculosis was the uniform x-raying of all inductees in the army and navy, with the permanent filing of miniature X-ray photographs with the examination of every man in the armed forces. (*See* TUBERCULOSIS.)

Venereal Diseases.—The venereal disease rates in the army and navy were lower than ever before, but they rose considerably among the civilian population, in some areas in association with a rise in juvenile delinquency. By a combination of heat treatment and the sulfonamide drugs, cases of gonorrhoea were controlled in from two to three days. By the use of the heat cabinet and mapharsen, a derivative of arsenic, cases of syphilis were reported cured, in many instances, in periods varying from a few days to 21 days, according to the system of treatment adopted.

Experiments in the intensive treatment of syphilis by these techniques, by mapharsen alone, by penicillin alone, were being conducted in intensive treatment centres set up by the United States Public Health service. Special attention was given to selection of cases to be given such treatments, since they were known to carry a considerable hazard. (*See* VENEREAL DISEASES.)

Neuropsychiatry.—The most frequent cause of discharge and rejection from the armed forces was neuropsychiatric disturbance, representing as high as 45% of all cases of disability. Special divisions of the medical department of the army and navy and the air forces were established to study and control this situation.

The Selective Service system developed a special technique, involving educational, psychologic and occupational study of selectees by trained social workers with a view to eliminating admission to the army and navy of men not qualified from a mental point of view. Several tests were developed for psychologic study, including one called the Minnesota Multiphasic Personality Inventory, which was found useful in industry for determining persons likely to have nervous breakdowns or accidents.



Continued experiments with shock treatment for various forms of mental derangement or mental depression indicated the chief usefulness of such methods was in depression psychosis. Electric shock seemed to be preferable to either insulin or metrazol shock. The methods have not lived up to what seemed to be their early promise.

Experiments continued with the operation on the frontal lobe of the brain—lobotomy—as a means of treating mental disease, particularly cases of anxiety or emotional upsets. The electroencephalograph or brain wave machine was applied to the study of epileptics, most of whom had abnormal electroencephalograms. More than 50% of the members of the immediate families of epileptics are likely to have abnormal tracings with this brain wave machine.

Among the pilots and air force personnel a condition called aeroneurosis was described, characterized by gastric disturbance, nervous irritability, insomnia and minor psychiatric disturbances. (*See* PSYCHIATRY.)

Vitamins.—Continued studies of the vitamins showed the one

PATIENT WITH A BROKEN LEG demonstrating his ability to walk shortly after the bone has been set and immobilized by a Stader splint. A pair of pins is drilled into the bone above and below the fracture, and the leg is set by means of mechanical adjustments. When the adjustments are complete (tightening all screws, turnbuckle, etc.) the reduction device automatically becomes a splint

most lacking in American diets was thiamine, called vitamin B_1 of the vitamin B complex. This vitamin is developed in the bowel of most persons by the action of intestinal bacteria. Some people are not able to develop enough thiamine to meet the body's needs. Drugs, like the sulfonamides, will destroy the intestinal germs which create this vitamin from food. Not all mothers provide the same amount of thiamine in their milk. The giving of thiamine to a mother by injection or increase of the vitamin in her diet will cause a rapid increase in the amount of thiamine in the mother's milk.

Experiments made in 1942 resulted in the claim that large doses of vitamin A would cause a lowering of blood pressure. In 1943, extended studies, including tests on human beings, proved that large doses of vitamin A cannot be depended on to lower blood pressure.

Many studies were made to show the vitamin content of most commonly used foods and the circumstances under which the vitamins are lost from food. (*See* VITAMINS.)

Surgery.—In surgery, attention was focused, because of the war, on the treatment of infected wounds and on shock. The exceedingly low mortality rate for the wounded was accredited to several factors—mechanization of the medical department, making medical corps service available practically in the front lines. When a man was wounded he received immediately the necessary blood plasma to overcome shock and loss of blood. He might inject himself with a narcotic drug, using a new device which permitted any wounded soldier to inject material, like a sterile solution of morphine, immediately. Rapid transportation by motorized vehicle or aeroplane took the wounded soldier promptly to a hospital far in the rear.

The sulfonamide drugs were given by mouth and in some instances applied directly to the wounds to lower the rate of serious infection. The mortality among the wounded in World War II was less than 3% and in many engagements less than 1%, contrasted with a death rate as high as 7% to 9% in previous wars.

The studies made on shock indicated that the administration of plasma was the important lifesaving measure. Scientists reversed their views on the treatment of shock by stopping the use of heat in shock and resorting to the use of a simple blanket to prevent chill. Research indicated that damaged tissues of the body are invaded by anaerobic germs and that the poisonous products of these germs may be the shock-producing substance.

Discoveries.—Vitallium, a new alloy, was used in medicine to bridge gaps in the bile ducts in operations on the gall bladder. Tantalum, a noncorrosive, malleable, nonabsorbable metal, was used to cover defects in the skull resulting from injury. Nerves were repaired by taking a section of nerve from a corpse and using it as a splint between broken ends of the nerves. Gum acacia or clotted blood was used to hold the splint in place. British and American war surgeons agreed that tourniquets do more harm than good in first-aid work.

Erysipelas was found quite controllable by the sulfonamide drugs and penicillin. A drug called thio-urea, which has the effect of lowering the basal metabolic rate and reducing the nervous irritability in excessive action of the thyroid gland, diminished the number of cases of hyperthyroidism and goiter in which surgery is necessary.

Sprains and strains were treated by anaesthesia and continuous use rather than by enforced rest. British surgeons applied electric stimulation which produces contractions and relaxation of muscles in the treatment of sprains and strains. Refrigeration as a means of producing anaesthesia developed considerable use in hospitals as a means of freedom from pain during amputation of limbs, but was not found practical in military surgery.

The army found that for ordinary burns boric acid treatment is best. More serious burns were treated with paraffin applications, plaster-of-Paris casts, and various pliofilm and other coverings.

Nutrition.—The attention of experts in nutrition turned away from vitamins and toward minerals and amino acids as essential substances. It was found that only 8 out of more than 22 amino acids are necessary to maintain the nitrogen required for the health and growth of the human body. The amino acids, in 1943, considered essential for the health of the human being were isoleucine, leucine, lysine, methionine, threonine, valine, phenylalanine and trytophane.

Public Health.—The outstanding epidemic conditions for 1943 were influenza, virus pneumonia, and infantile paralysis which reached a new high level in the United States, meningitis which regularly increases during war periods, and venereal diseases which also increase in wartime.

The birth rate for 1943 was the highest in the history of the United States, increasing to 24 births per 1,000 population. Nineteen forty-three was the fourth year in succession in which the birth rate increased The number of babies born is 200,000 greater than in 1942, and nearly 1,000,000 greater than the low point of 1933. (M. FI.)

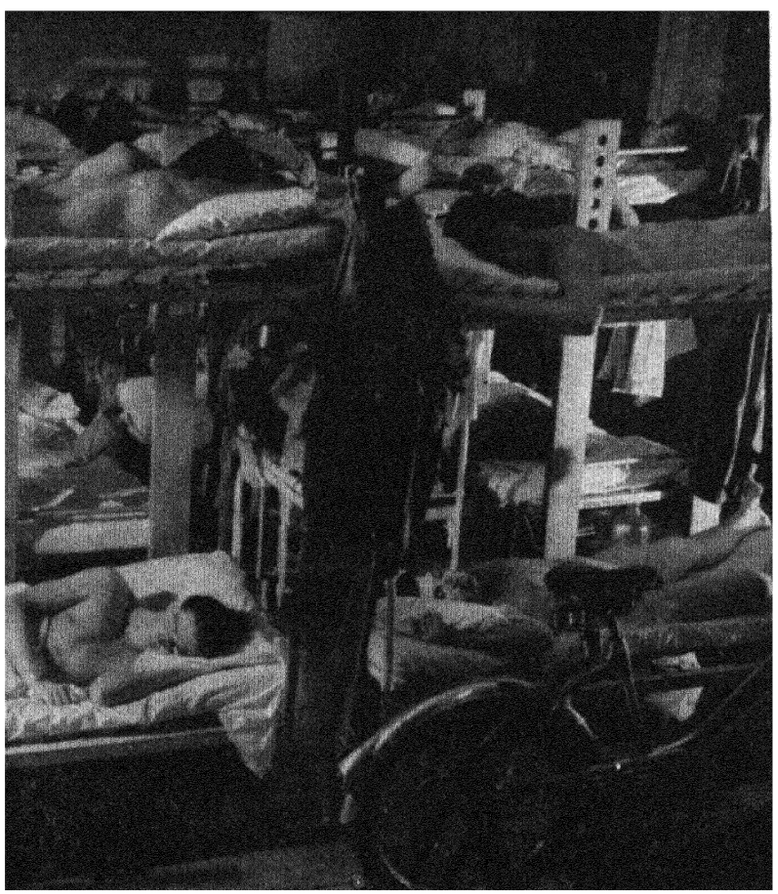
Military Medicine, U.S.—Numerous military medical advances were realized while others were conceived and were in the developmental stage. An important advance was the creation and use in combat of the small portable hospital which was carried forward near the battle front, by hand if necessary, in order to provide emergency surgical aid soon after soldiers are wounded. This and similar methods which bring medical aid nearer the front lines were factors in bringing about a pronounced reduction in the mortality rates of American fighting men when contrasted to those of World War I.

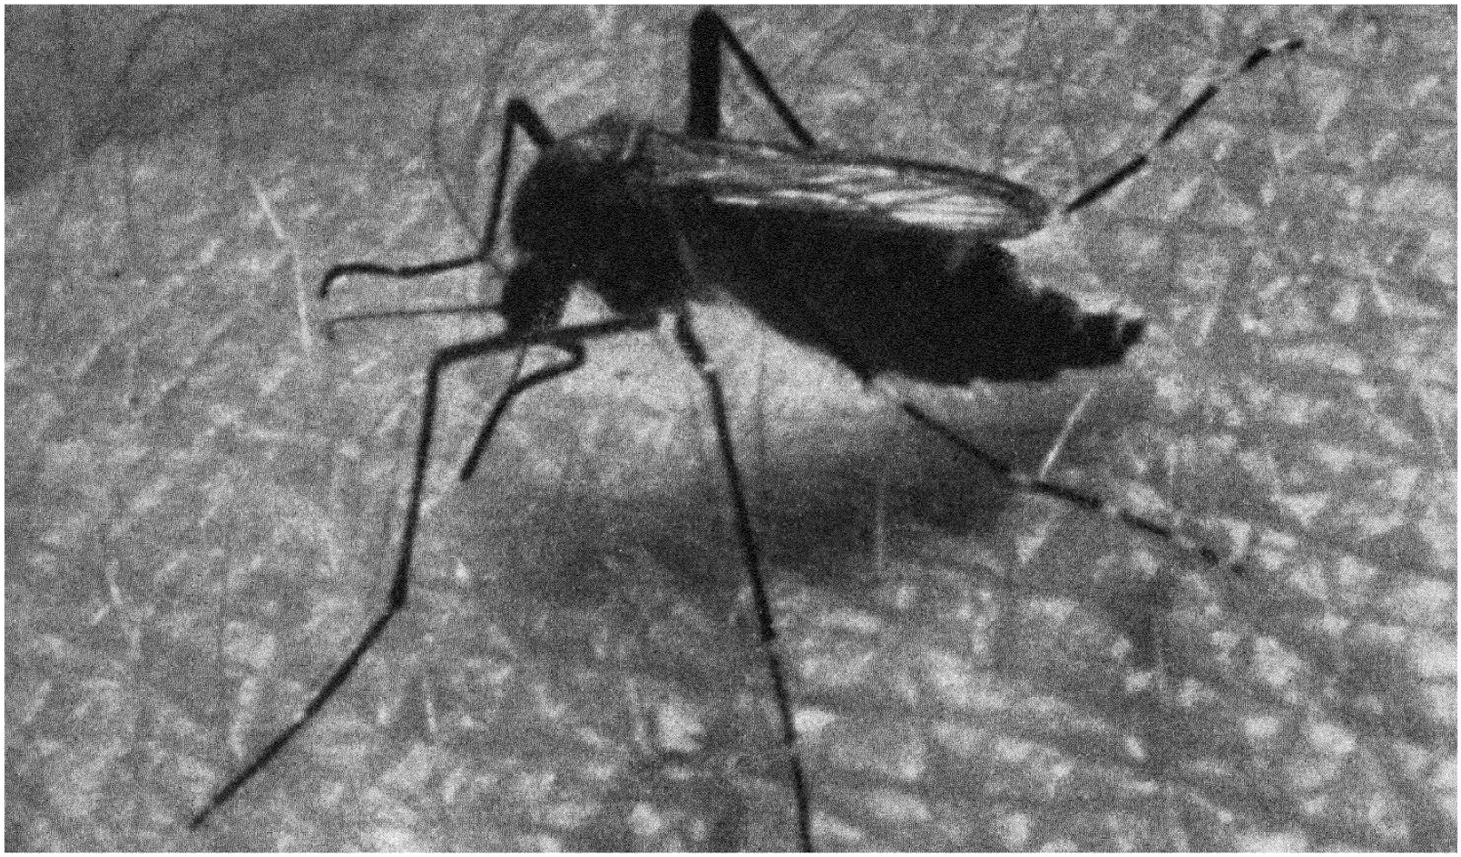
Another medical achievement more extensively used near the front during 1943, sometimes even in foxholes, was blood plasma for cases of shock and the severely wounded. The blood which the people at the home front generously donated through the facilities of the Red Cross thus became a means of saving many fighting men who, if similarly wounded in World War I, would have died.

The evacuation by air of patients from the front to hospitals in the rear and to the homeland was more extensively used during 1943.



Wounded and sick soldiers greatly benefited also by more extensive use of the sulfa drugs which were taken with them to the front. The sulfonamides prevented many serious systemic infections. They were important in reducing the mortality rate in meningitis from 39% in World War I to a 1943 rate of about 4%, and in reducing the pneumonia mortality rate from 25% to 4%. They radically improved the management in the army of the gonorrhoea problem and greatly reduced the complications of streptococcal infections, scarlet fever and measles.

TO STUDY THE EFFECTS OF EXTREME COLD on U.S. soldiers, men at Armored Medica Research laboratory, Fort Knox, Ky. are placed in a cold room with temperature o —30° F. Here they are bundled in sleeping bags



PENICILLIN MOULD CULTURES growing in bottles placed in incubators. Penicillin, a powerful antibacterial compound, was produced and used in increasing quantities during 1943, mostly for the U.S. armed forces

"HOT ROOM" in which the U.S. Armored Medical Research laboratory observes the effects of extreme heat on soldiers

A RECORD PARACHUTE JUMP of 40,200 ft. was made by Lieut. Col. William Randolph Lovelace II, U.S. army flight surgeon, June 24, 1943, near Ephrata, Wash. Col. Lovelace, here shown breathing oxygen as he dressed in warm clothing before taking off, made the jump to demonstrate the safety of bailing out with proper equipment at stratospheric levels

AËDES AEGYPTI, carrier of yellow fever and dengue, photographed on the arm of a medical researcher (linear magnification, 20 times). Increased and speedy traffic with countries where these diseases are endemic intensified control methods in the United States in 1943

Penicillin, an extract of cultures of a common mould (*Penicillium notatum*) was a new therapeutic agent which has potent bactericidal properties. Amazing results in the treatment by penicillin of certain infections were obtained. Further purification of the extract by the manufacturers together with additional extensive clinical studies of its effects offers great promise. The surgeon general of the army during 1943 sponsored clinical studies of penicillin therapy in surgical infections in a number of army hospitals, with the co-operation of the committee of medical research of the office of scientific research and development. The report of the treatment of septic gunshot fractures with penicillin indicated that dramatically successful results might be achieved by the meticulous surgeon who combined penicillin, effective blood transfusions and conservative surgical procedures into a program of thoughtful management of individual cases. Well-planned clinical and laboratory investigation also revealed that a major deficiency of red blood cells and haemoglobin occurred in such cases. The regeneration of red cells and haemoglobin depends on control of the infection. Penicillin was found to be "dramatically" effective in rapidly establishing this phase of convalescence. Penicillin permitted a direct surgical approach to the management of septic gunshot fractures. Its role in this regard, however, was analogous to the use of vitamin K in patients with obstructive jaundice. Such a concept, the report stated, emphasized the limitations of penicillin therapy and designated the supplemental position of penicillin in the over-all surgical program.

Typhus fever wrought havoc in armies and civilian populations in the past. It was prevalent in Russia and central Europe during World War I. While no proven cases appeared in the American Expeditionary Forces in World War I, many troops in World War II served in typhus-infected areas. Louse-borne typhus steadily increased among the native populations of North Africa, the near and middle east, and elsewhere. Had the American army not foreseen the possibility of outbreaks of typhus and taken precautionary measures, epidemics might have occurred among U.S. troops. The surgeon general's office constantly watched the typhus situation long before American troops invaded Africa, and as that event approached, the need for definite typhus control measures became clear. The president, therefore, by executive order, on Dec. 24, 1942, established the United States of America Typhus commission, the forward echelon of which was in Cairo. During 1943 the Typhus commission collected many strains of typhus virus. U.S. troops serving in or preparing to go into typhus-infected areas were vaccinated against typhus. There was developed at the Army Medical school a means whereby the prevailing types of typhus in a region could be determined. By this means—the complement fixation test—epidemic typhus was discovered in a South American country and surveys were being made in other countries. Previously it had not been possible to differentiate by this method between epidemic and endemic typhus antisera. Serologic evidence was obtained to substantiate the theory advanced by Zinsser that Brill's disease represented a recrudescence of an old attack of typhus fever. The implications were that mild cases of epidemic typhus actually existed in the United States and that one attack of typhus did not confer lifelong immunity, as had been generally believed. The observations on Brill's disease, Plotz said, strongly suggested that man serves as the reservoir for epidemic typhus between outbreaks, as the rat does in endemic typhus. The surgeon general's office had developed an agent which would completely delouse clothes in 30 minutes using very simple equipment in comparison to the cumbersome and time-consuming method used in World War I. In addition, a powder was developed which when sprinkled once in the seams of clothing would keep insects away for at least two weeks. Thus the typhus prevention program was far advanced during 1943.

American troops in Africa up to the close of 1943 had been practically free of typhus fever.

The National Research council sponsored extensive studies in various clinics on the treatment of burns. Progress on this important subject was expected to develop; it was agreed that the prevention and treatment of shock in every severe burn was

the first indication and should precede any definitive treatment. The most important early general complication was loss of plasma volume as a result of plasma leakage into the interstitial spaces. This, it was found, could be largely prevented by firm pressure bandaging and controlled by plasma transfusion. In all, about 80 methods of burn therapy were published up to 1944 and there was some disagreement regarding the best therapy; however, the pressure method was rapidly gaining in popularity. The studies under way by the several burn projects and the National Research council, no doubt when assembled and analyzed, would give valuable therapeutic, pathologic and bacteriologic data on this controversial subject.

Among important advances in surgical technique in the treatment of wounds of the colon, apart from the transverse colon, was the exteriorization at the time of the primary operation of the damaged loop of colon through a small lateral incision in the iliac fossa or the hypochondriac regions. The exploratory central incision was then closed quickly. The colonic loop having been pulled out through the small lateral incision was at that time not subjected to further surgery but allowed to serve as a colostomy. This made safer and simpler the primary operation on soldiers with wounds of the large bowel and reduced the danger of sepsis.

The surgeon general's office was very much interested in research, a fact further evidenced by the rapid expansion of the Virus laboratory at Walter Reed hospital, studies of the medical aspects of tank warfare at the Armored Forces Medical laboratory at Ft. Knox, studies at the Medical Equipment laboratory at the Field Service school at Carlisle barracks, and research at the Army Industrial Hygiene laboratory at Johns Hopkins university, which, among other things, investigated the equipment and materials used by the army with reference to toxicologic considerations and, at the same time, offered its services to all army installations for the chemical analysis of materials with reference to the presence of toxic substances; numerous improvements in medical equipment and supplies were made, including the first overseas type of hospital train to be built in the United States and specially designed for use in combat areas. Trains of this type were for the removal of sick and wounded from the evacuation hospitals, which were usually within 25–50 miles of the front lines, to the larger general hospitals perhaps hundreds of miles in the rear. (*See* also NURSING, WAR.)

(J. F. H.)

Mediterranean, British Possessions in the.

These comprise Gibraltar, the Maltese islands and Cyprus, of which the accompanying table gives certain statistics. (*See* also BRITISH EMPIRE.)

History.—*Gibraltar.*—Conditions in 1943 were naturally improved as a result of the Allied victories in the Mediterranean theatre. In Gibraltar it was announced on March 8 that men under 55 fit for sedentary work and men under 50 fit for other work essential to the colony's economy, who had been evacuated in 1940, might apply to return. A scheme was also begun in July for Gibraltar civilian workers to spend 6 weeks' leave with their families evacuated to England; about 1,300 out of a total of nearly 3,000 with evacuated families were affected, the other families being in Jamaica or Madeira.

There was some trouble from sabotage during the summer, and two Spanish dockyard workers were sentenced to death, the one for causing an oil fire in the dockyard, and the other for attempting to cause a dockyard explosion.

Malta.—The North African victories raised the siege of Malta and, in the words of the governor, turned the island from a "beleaguered and battered fortress" into a "vengeful citadel." Enemy air raids were few and caused little damage. From Sept. 1939 to June 1943 civilian air raid casualties totalled 1,436 killed and 3,415 injured, with 6,952 buildings destroyed or damaged.

On July 7 the colonial secretary announced in parliament the British government's intention immediately after the war to restore responsible government in internal affairs to the Maltese people, and Col. Strickland, the leader of the elected majority in the Maltese council of government, urged that the preliminary work should be begun at once. Other tributes to Malta's heroic defense included the granting of a Rhodes scholarship every year instead of once every three years and of a British council architectural scholarship. Educational development continued during the year; the British institute did good work, and an institute was also opened on the island of Gozo.

Supplies became much more plentiful on the island, and from Oct. 28 for the first time since the siege began restaurants and snack bars were allowed to serve light meals. Fruit, wines and esparto grass, badly needed by the fishermen, were also being sent. The rising cost of living caused some labour trouble, however, and during September some 20,000 dockyard and other workers struck work in a demand for an adjustment of war bonuses. At the beginning of October they agreed to return to work and not to strike for the duration of the war, provided adequate conciliation and arbitration machinery were set up and the living conditions of civil and defense employees were levelled up.

Cyprus.—Like Malta, Cyprus became a formidable base for attack, and large forces gathered there from all parts of the empire brought the island a temporary wartime prosperity. The rising cost of living caused some labour troubles, and there were strikes in January and August. Measures were undertaken to tax the

higher incomes, to subsidize essential goods and to raise the lower wages, and afforestation and irrigation schemes were under way for agricultural improvement; the 1943 harvest promised to be the best for 10 years.

In March the first municipal elections in 13 years were held, with an adult poll of over 90%, and the colonial secretary announced in parliament on March 31 that everything was being done to encourage democratic institutions and self-government. This question raised difficulties, however, since the Greek population demanded union with Greece, while the Muslim minority reaffirmed its desire to remain under British rule.

The budget deficiency of £250,000 was covered by a grant from the British government, with further grants for subsidies to reduce living costs. Sir E. Jackson, lieut.-governor of Malta, was appointed chief justice of Cyprus on Feb. 21. (C. M. Cl.)

Mei Lan-fang (1893–1943), Chinese actor, noted for his performances in female roles, was one of China's biggest box office attractions. Both his grandfather, court idol of the middle 19th century and outstanding impersonator of female roles, and his father, were celebrated actors. Mei Lan-fang made his professional debut at the age of 13, soon won the title of "king of actors" among Chinese audiences and was acknowledged the peer of even the greatest Chinese actresses. In 1930, he took his company of 22 actors on a tour of the United States and was received at the White House by President Hoover. An unconfirmed report of his death from poisoning in Shanghai, Aug. 8, was picked up in Chungking from a Japanese radio broadcast.

Mello Franco, Afranio De (1870–1943), Brazilian statesman, was born Feb. 25 in Paracatu, in the state of Minas Gerais, Brazil. He studied law at the University of São Paulo and later taught philosophy and international law. He was Brazil's representative at the League of Nations, 1923–26, and was twice president of the league council. In 1926, he announced Brazil's withdrawal from the league because the nation had been refused a permanent seat on the council. He served as judge of the Permanent Court of International Justice, The Hague, 1923–29. He became foreign minister in the Vargas government when the latter seized power in 1930 but resigned three years later. A recognized authority on international law, he was named chairman of the American Neutrality commission meeting at Rio de Janeiro. Later, when the United States became involved in World War II, and this commission was transformed into the Inter-American Juridical committee, he continued as president. The committee was created for the purpose of co-ordinating American legislation and policy on international problems brought about by the war. He died in Rio de Janeiro, Jan. 1.

Meloney, Marie Mattingly (Mrs. William Brown Meloney) (1883?–1943), U.S. editor, was born in Bardstown, Ky., the daughter of the former Sarah Irwin, founder and editor of the *Kentucky Magazine*. After her career as a concert pianist was cut short by an accident, she turned to writing and journalism. Before her marriage to the late William Brown Meloney, an editor of the *New York Sun*, in 1904, she wrote a column for that newspaper called "Men About Town." She began her 16-year association with the *New York Herald Tribune* in 1926, became executive director of the *Herald Tribune* Home institute and organized the annual *New York Herald Tribune* Forum on Current Problems, of which she was chairman. She also became editor of the *Herald Tribune's* Sunday magazine in 1926, continued at that post when the publication became known as *This Week* and brought its weekly circulation up to 6,000,000. She resigned in June 1942 and was named its editorial director. Mrs. Meloney died at her home in Pawling, N.Y., June 23.

Merchant Marine: *see* Shipping, Merchant Marine.

Mercury. Although mercury was classed as a strategic metal when this group was organized, and was expected to make trouble through shortness of supply in emergency, the industry made a much better record than had been thought possible. Production in the United States was rapidly built up to a point where it met the demand, and instead of the country being dependent on imports for a large share of the consumption, probably more metal was exported than imported. At the same time stocks were accumulated to such a point that during 1944 both production and imports were expected to be reduced by 30%. The metal during the latter part of 1943 was listed as one with a surplus of supply over essential demands, and some of the controls on uses were to be relaxed.

A small output was developed in Canada as a war measure, from deposits in British Columbia, and was so successful that it supplied the domestic demand, with some for export. Some of this surplus was shipped to the United States under contract with the Metals Reserve company, but the contract was cancelled in October, when stocks had reached the desired level.

No definite figures were reported on Spanish output, but it was said to have exceeded the 85,500 flasks produced in 1941. After the shift of Italy from the axis to the United Nations, there was interest manifested in the effect that this would have on the production and disposal of the mercury output, when the producing areas were cleared of German occupation. (G. A. Ro.)

Metallurgy. In the 1943 developments along metallurgical lines the chief emphasis was on the saving of time, labour and metals, rather than on the usual commercial angles of costs and profits; the latter would follow automatically when the new methods and processes created under war demand would be applied to peacetime operations.

Corrosion Prevention.—An improved process electroplates silver on magnesium as a protection against atmospheric corrosion.

High-Temperature Alloys.—The temperature at which steam can be used was raised to 1800° F. by the development of new alloys.

Inspection Methods.—A mass production method was developed for the X-ray inspection of aeroplane castings which produces a photographic record of six castings every 30 seconds, or at the rate of 17,000 per day.

Metal Shaping.—Methods were devised for precision forging of automotive gears, saving the time formerly required for machining. Machining operations, in general, were speeded up, with special attention given to the construction of combination machines which could perform a whole series of operations, applying the principles of the automatic screw machine to a highly complicated succession of different operations, such as the conversion of a rough casting into a finished aeroplane engine cylinder. Precision casting methods were developed which will give an accuracy of 0.001 inch on small parts, resulting in savings of metal, time, tooling costs, machining time and man-hours.

New Applications.—The familiar bimetallic disc used for several years as a control in electrical heating devices was adapted for fire protection devices in war planes.

Welding.—New methods and applications for welding were being developed. One of these was the "stitching" of stainless

steel sheets by special resistance welding machines.

Copper.—A copper-clad steel wire, developed for use in high-frequency communication lines, was found to be as efficient as solid copper.

Lead.—A novel method of making moulds for the shaping of thermo-setting plastic consisted of dipping the pattern in a bath of melted lead, forming a thin coating of lead on the surface of the pattern, which is then withdrawn, or by die casting if the pattern is complicated. After using for forming the plastic, the mould is stripped off and remelted for use again.

Lead powder mixed with a high viscosity grease was satisfactorily used as a lubricant for heavy gears.

Steel.—Large quantities of copper and zinc were saved by the development of a steel cartridge case for ammunition. After the original development in the United States, the steel case was adopted by Great Britain also.

Possibly the greatest single step in the saving of strategic steel-alloying metals was accomplished by the development of an extensive series of so-called "NE" (national emergency) steels. These are low-alloy steels designed to take the place of the standard types of alloy steels with higher alloy content. These steels were so successful that they would account for about one-third of the 1943 output of alloy steels in the United States.

Substitutes.—Plastic printing plates were developed to take the place of aluminum and zinc needed for other uses. Electrolytic iron can be used as a substitute for copper or nickel in electrotype plates and in the surface hardening of stereotype plates.

Substitution of steel for copper, brass and aluminum would, when fully adopted, effect savings in excess of 300,000 short tons of copper, 200,000 tons of zinc and 50,000 tons of aluminum.

Lead-base die castings were being extensively substituted for brass, aluminum and zinc-base castings. It appeared that lead-base bearing metals might also be used to replace similar alloys containing tin.

Tin.—Rapid and continuous methods of electroplating tin on sheet strips for can manufacture were saving from one-half to three-quarters of the tin required by the old hot-dip process.

(G. A. Ro.)

Metal Prices and Production: *see* MINERAL AND METAL PRODUCTION AND PRICES.

Meteorology.

With some modifications dictated by experience, the applications of organized meteorology to military needs progressed during 1943 on essentially the same basis as in 1942. Within the United States the civilian weather bureau continued to operate the basic service for synoptic observations and forecasts, while the military services, with their own personnel and facilities, applied these basic values to such military purposes as aviation training, manoeuvres, handling of supplies, the conduct of coastal air and maritime patrol, destruction of enemy submarines, transoceanic air transport, and convoying operations in the Atlantic and Pacific. For the staffing of military meteorological units abroad, the army and navy continued intensive training of meteorological cadets and officers; and active meteorological services were put in operation as rapidly as the U.S. military control of foreign areas progressed. The value and importance of these services as guides to tactical operations—aerial, maritime and land-surface alike—were abundantly demonstrated in active practice.

In a joint project of the army, navy and weather bureau, work was completed during December on a 40-year series of daily sea-

AIR FORCE CADETS sending up a radiosonde balloon at the meteorology department of New York university

level weather maps of the northern hemisphere. Bearing representative weather observations from all areas north of the equator, the maps were analyzed by the most modern air-mass and frontal techniques, and show the development and movement of important weather conditions and their interrelations and seasonal variations. Printed in book form for the use of meteorologists in active forecasting assignments with the armed services, this convenient assembly of data should later prove of immense value in meteorological research and practice. Supplementary maps for the 3, 10, 13 and 16 kilometer levels were also prepared for a portion of the 40-year period of the sea-level series. Studies of the two sets in conjunction disclosed significant and hitherto unknown relationships between upper-level and surface-level weather—suggesting, for example, that the southward movement of stratosphere air from the polar regions and the northward movement of the relatively colder stratosphere air from the tropics are directly associated with the development of severe cold waves.

During Nov. 1943, the domestic censorship of weather information was discontinued for all types of current weather data and forecasts except for such elements as might still be useful in hostile submarine or aerial operations affecting United Nations interests. A legitimate safeguard during the uncertain stages of the war immediately following the attack on Pearl Harbor and during the height of German submarine activity off the Atlantic coast, the censorship caused widespread inconvenience from the domestic standpoint. It likewise brought into sharp relief a large number of specific uses and applications of weather information in the operations of industry, transportation, utilities management and agriculture. To meet the needs of such activities, the U.S. weather bureau instituted a system of operational advices, designed to omit meteorological information and at the same time to guide operations affected by weather. The effects of this development would undoubtedly be visible henceforth in an improved form of forecasting, applying more directly to actual operating procedures such as the management of gas and electric loads, the timing of fruit spraying and harvesting crops, and the protection of perishables in railroad transit.

An important service to aviation was accomplished during 1943 in the organization of the weather bureau's flight advisory weather service. This service was to be directly associated with the operations of the airway traffic control of the Civil Aeronautics administration, which is responsible for the safety of aircraft in flight. Meteorologists, skilled in the interpretation of weather data, would be assigned to all the airway traffic control units, to assure that the latter are at all times supplied with (a) the latest available information on existing meteorological conditions aloft, (b) trends of weather change of significance to current flights, and (c) specific information on anticipated developments upon which orders for the continuation or stoppage of flights may be based by the traffic controllers. These advisory weather units, under organization at the close of the year, were to be established at the 23 civilian airway traffic control centres which, in direct liaison with army air forces control units of similar pur-

pose, actively supervised the aviation of the United States.

Another important contribution to the protection of aviation, particularly with respect to landings at the larger air fields, was the congressional approval of the installation of ceilometers at 112 additional airport stations of the weather bureau. This instrument, designed to measure the heights of cloud ceilings during daylight as well as at night, proved its worth as a much-needed safety device. Also, a pronounced advance in observational procedure was launched during the Texas coast hurricane in late July by Col. Joseph D. Duckworth and Lts. Ralph M. O'Hair and Wm. H. Jones-Burdick of the army air forces instructors' school at Bryan field, Texas, when they flew in an AT-6 aeroplane around and through the centre of the hurricane to observe its size, intensity, location and the mechanics of its temperatures, pressures, winds and clouds. Forecasting of these larger storms had depended largely upon observations from ships in the vicinity of the storm—an advantage often reduced or lost by the efforts of ships' masters to avoid the storms as widely as possible. The successful flight of these officers proved the practicability of aeroplane reconnaissance flights for the purpose of first-hand observation of hurricanes in action, and doubtless marked the first step in a systematized program for obtaining essential information by this method.

In research, weather bureau studies of the dynamics of large-scale air currents in middle latitudes produced a new technique for forecasting the trajectory of particles of air over three-day periods; and the method was applied to the forecasting of winds at three kilometres in the midlatitude band of westerlies. New empirical formulas were developed also for forecasting the movement of long waves in the westerlies, and these waves were found to be related to the surface-weather tendency to vary in trends lasting for periods of a week or more. Studies conducted by the weather bureau in collaboration with the war department's corps of engineers continued the development of techniques for analyzing storms and estimating the maximum amount of precipitation that can fall in a given river basin from the most severe and long-lasting storm.

A direct and effective impetus to meteorological progress in the western hemisphere was accomplished during 1943 by the institution of a training class for Latin American meteorological students at Medellin, Colombia. Conducted under the auspices of the state department and the weather bureau in co-operation with the Colombian government, the course ran for seven months beginning in February and concentrated directly upon the basic sub-professional subjects of instrumentation, observations, weather map plotting and analysis, mathematics, physics and English. Some 200 Latin American students attended and the teaching staff consisted of 10 Latin Americans and an equal number of North Americans. Of the graduation group, 40 were chosen for advanced meteorological training in the United States and six diverted to further training in agricultural meteorology. This professional training was to be followed by an internship of several months at active forecast offices in the weather bureau. The advanced training was financed by funds provided by congress and the granting of 22 scholarships by the universities to which the students were assigned. There was also established at San Juan, P.R., an Institute of Tropical Meteorology to give concentrated study to weather conditions in the Caribbean and adjacent areas, particularly as these apply to aviation and the inception, development and movement of hurricanes.

In intent and fact these extensions of meteorological study for application beyond continental borders represented the first active steps in the trend toward international meteorological co-operation that must inevitably follow the war. Results of that trend could not be anticipated, but speculation was already decidedly active among meteorologists on questions of communications, observational contents, timing and distribution that would be more necessary than ever for the protection of world-wide air commerce in the future. The scope of meteorological requirements for this commerce embraced the fundamental necessity to extend, integrate and standardize the basic network of synoptic weather stations throughout the world. Also required would be a large number of new stations in the so-called blind areas, on land as well as at sea. It would be necessary to organize, for uniform operation throughout the world, an in-flight radio reporting system to supply weather reports (from aircraft in flight) upon conditions of cloud, wind, icing, humidity, etc., prevailing in the higher atmospheric levels. The required rapidity of distribution of current weather reports to assure adequate synoptic mapping over large portions of the earth's area would need the aid of an unprecedented operating efficiency in international communications to cope with the abundance as well as the combined need for uniformity, speed and accuracy in observation transmissions. Agreement among governments and air-transport operators must be soundly established and actualized to the end that all types of

meteorological information from all sources should be freely available to all users in the common support and protection of the commerce. Finally, international research, designed to fit the borderless nature and action of weather, would necessarily command a co-ordinated international interest in the general improvement of meteorological practice.

The Weather of 1943.—In general, the weather of 1943 was warmer, drier and sunnier than usual, and over large areas decidedly different in several respects from that of 1942. It was somewhat less favourable for agriculture, principally because of untimely spring frosts, excessive wetness during the planting and early haying season and, later, harmful dryness in some areas. There was much less rainfall than during the preceding year which curtailed crop production in some sections, but in most of the principal agricultural states favourable conditions prevailed, and the general farm output, while considerably below that for 1942, was larger than normal. The less favourable crop weather is emphasized by the fact that while the combined acreage for 52 crops harvested in 1943 was more than 9,000,000 ac. in excess of 1942, total production was 6% less.

Following the general temperature trend in evidence for a good many years, the winter of 1942–43 was warmer than normal in nearly all sections of the country. However, notwithstanding this general warmth, the winter brought some extremely cold weather, the lowest temperature reported being −60° at Island Park dam, Idaho, on Jan. 18.

Spring frosts and freezes did much damage, especially in the south-central and southern parts of the U.S. where fruit and early vegetables were killed over large areas. As a result, unusually small crops of apples, peaches, cherries, apricots and strawberries survived for harvest.

East of the Mississippi river the spring season, in addition to the untimely frost, brought frequent heavy rains to many sections which seriously hampered farmers in the planting of corn, haying and other seasonal work. Thus, the corn crop got off to a late start but the summer brought higher than normal temperatures and much sunshine to the principal producing states which hastened development. Corn matured with no material frost damage and the fall season was unusually favourable for harvest.

The summer had above normal temperatures in nearly all sections of the U.S., and most of the principal agricultural states had sufficient moisture to produce good crops. In considerable areas, especially the middle Atlantic states and a large south-central section, it was one of the warmest summers of record. However, while most central and northern states had timely summer rains, unfavourable dryness developed in central-eastern sections and much of the south. The highest temperature recorded for the summer was 124° in July, reported from two stations in California.

The outstanding feature of the fall and early winter was widespread dryness, in marked contrast to the two preceding falls. The New England states, New York, Mississippi and Louisiana were the only states with as much as normal rainfall for the three fall months. It was one of the driest falls of record over large areas. While this was decidedly favourable for the harvesting of crops and made possible maximum returns from a minimum of harvesters, the dryness was unfavourable for the seeding and germination of winter grains, especially in the western winter wheat belt and the south. In the central and southern plains the dry weather restricted the acreage that could be seeded to wheat, delayed seeding, and greatly reduced the usual fall grazing of livestock on wheat fields. This, together with reduced grazing on other pastures, accentuated the feed shortage and increased the liquidation of livestock, especially in the southwest.

About the middle of December another severe freeze overspread the south, resulting in more or less damage, heavy in localities, from Texas eastward to Florida and the Carolinas. Florida suffered most with a loss of truck crops, many ready for market, valued at more than $4,000,000. Temperatures were not low enough to seriously harm citrus fruit and they escaped with negligible damage.

The year, mainly the first half, brought extensive flood damage. The most noteworthy floods occurred in May, affecting seven states from Oklahoma to Michigan and causing extensive damage to rich agricultural and industrial areas. In parts of the Arkansas and Osage rivers the floods were the greatest in 100 years, with near-record stages reached in the middle Mississippi, the Illinois, Wabash and Maumee rivers. An outstanding storm of the year was a tropical hurricane in southeastern Texas on July 26–29, which did some $15,000,000 damage. (*See* also DISASTERS; FLOODS AND FLOOD CONTROL.) (F. W. RR.)

Other Countries.—The values for monthly rainfall and monthly mean temperatures given in the accompanying tables referring to countries outside the United States are provisional and may in some cases require a small correction. On account of war conditions it was not possible to give complete data for some of the stations. Gaps in the tables indicate that the data could not be obtained. (D. BRU.)

Methodist Church. Prior to Dec. 1, 1943, the Methodist Church sent 1,000 ministers into the army as chaplains and 300 into the navy, about two-thirds of its quota; had raised more than $2,000,000 for purposes related to the war; and had set up a plan for exerting pressure upon the peace-framing agencies of the government. The Crusade for a New World Order, popularly called the "Bishops' Crusade" because initiated by the council of bishops, started Jan. 1, 1944, and through an elaborate program of meetings, broadcasts, study classes and house to house visitation aimed to stir the minds of Methodists, so that they would express themselves by showers of post cards to congress, urging that certain Christian principles be embodied in the postwar reconstruction of the world. Subsidiary to this end was a Conference on Bases of a New World Order held at Delaware, O., in March 1943, when the subject was presented by distinguished speakers.

The die-hard group in the former Methodist Episcopal Church, South, experienced a setback on Aug. 26, when the supreme court of South Carolina ruled that the plan of union was valid, and that unification was soundly based in the law. The second part of the decision denied to the Methodist Church the exclusive right to the use of the title "Methodist Episcopal Church, South." The issues were to be taken to the federal courts.

The council of bishops in session in Princeton, N.J., in December, elected Bishop H. Lester Smith of Cincinnati, president and G. Bromley Oxnam, secretary.

The Statistical centre was removed from New York to 740 Rush st., Chicago; and Albert C. Hoover replaced Thomas P. Potter as director. There were 24,176 Methodist ministers serving 42,000 congregations, on 21,031 pastoral charges. Sunday school enrolment continued to decline, having reached 5,093,558. Adult baptisms 143,314; children 124,104. So-called active members in the United States 6,640,424, a gain of 80,829; "nonresident members" (1,173,467) gave a total on July 1, of 7,713,891. Receipts for ministerial support were $35,342,931. Local churches raised for current expenses $43,693,423 in the fiscal year ending May 31, 1943; the Commission on Overseas Relief took in $464,049. Total war emergency receipts were $1,400,000. Scattered reports from many localities showed that debt-paying was easy. One third of the Methodist Church debt in Missouri was liquidated.

Total sales for the Methodist Publishing House reached $6,326,-144. Its Abingdon-Cokesbury line of nondenominational books was exceptionally popular; the circulation of its 24 Sunday school periodicals ran above 6,000,000, and the weekly *Christian Advocate,* with 250,000 circulation, led all denominational weeklies. Out of the produce of the business $250,000 was appropriated for distribution to the retired ministers. Similar amounts were being used to reduce the debt incurred during the bad years, and to create a reserve for improved machinery.

The Division of Foreign Missions, which staggered under a debt of about $3,000,000, paid the last dollar of the remainder, $341,-728. The church supplied money enough to pay for the repatriation of scores of mission workers from the war-torn lands. In co-operation with Overseas Relief and the Woman's Division of Christian Service, it was possible to send $15,000 a month for the aid of Methodist workers of China.

For world service in 1943 the Methodist Church gave $4,659,-830, an increase of $492,063 over the previous year. This was apportioned among the 12 boards and commissions according to a fixed ratio. The Board of Missions and Church Extension received 69.30%, board of education 14.55% and the remaining one-sixth went to the ten minor causes, eight of them getting less than $50,000 each. The foreign division reckoned as one of the major decisions of the year the setting apart of the proceeds of the Collins bequest, approximating $3,000,000 in standing timber, as a reserve on which to base an adequate plan for pensioning retired missionaries.

Methodist philanthropies which began in the U.S. in 1883 attained considerable magnitude. Hospitals in U.S. 79, bed capacity 13,248, operating expenses $19,717,790, value of property $66,-134,163; child welfare 56 homes with 6,847 inmates, and property worth $12,721,143; 47 homes for aged with 3,777 inmates with $11,734,207; homes for business girls and young women, 24 accommodating 1,165, in property valued at $1,265,134. Of the Methodist hospitals 73% were rated Grade A by the American College of Surgeons.

Financially the educational event of the year was the bequest of Walter Murphy to Northwestern university, amounting to $20,000,000. Executive changes of importance were: the resignation of President McConaghy of Wesleyan university; he was succeeded by Dean Victor L. Butterfield; in place of John B. Magee, deceased, Dr. Russell D. Cole became president of Cornell college; Dr. Hugh C. Stuntz succeeded President J. L. Cunningim at Scarritt college; Rev. Robert O. McClure was elected president of Ohio Northern university.

From collections and endowments, local and national, $3,810,-167 was distributed in 1942 to 14,060 retired Methodist preachers and their dependents. The total of the vested funds was $28,822,361. (J. R. J.)

Metropolitan Museum of Art: *see* ART EXHIBITIONS; ART GALLERIES AND ART MUSEUMS.

Mexico. A federal republic of North America lying between the United States and Central America. Area, 767,168 sq.mi.; pop. est. 20,623,826 (19,473,741 census 1940). Approximately 55% of the population was mestizo, 29% Indian, 15% white, with foreigners and others making up less than 1%. The language is Spanish, but an estimated 14% speak only Indian tongues. There is no official state religion, but the people are overwhelmingly Roman Catholic. The capital is Mexico City (pop. 1,464,556). Other principal cities are: Guadalajara, 228,049; Monterrey, 180,942; Puebla, 137,324; Mérida, 98,334; León, 86,089; Tampico, 81,334; Aguascalientes, 81,124; San Luis Potosí, 78,042; Torreón, 76,613; Veracruz, 70,958; Chihuahua, 57,456; Pachuca, 52,387. The president in 1943 was Gen. Manuel Avila Camacho (took office Dec. 1940).

History.—In its second year at war with the axis powers, Mexico was still rendering economic and spiritual assistance to the cause of the Allied Nations rather than engaging in active military participation. Nevertheless, considerable feeling was rising for forming an expeditionary force so that Mexico could take a more important place among the Allied Nations. Generally speaking, a lack of war materials deterred Mexico from entering more actively into the combat.

One of Mexico's early moves had been the arrest and segregation of dangerous enemy aliens. Under Miguel Alemán, youthful and energetic minister of the interior, the more dangerous of the aliens had been interned. However, it was estimated in Jan. 1943 that approximately 4,500 Japanese nationals remained scattered throughout the population. Evidence of subversive activities by these hidden elements was watched for constantly.

Growth of the army in Mexico continued steadily. The class of 1924 was called to the colours on Flag day, March 2, at which time throughout the country impressive ceremonies were held.

Besides the army itself, Mexico encouraged civilians to train and drill with a goal in view of 2,000,000 trained reserves. Under the decree of Aug. 11, 1942, all able-bodied men were required to have military instruction. However, by the summer of 1943 the president decided that military drill should be voluntary. Civilian military training fell off abruptly in the cities, although remaining almost unchanged in the rural areas.

In Mexico City one of the largest military displays of 1943 was held on Independence days (Sept. 15 and 16). Parades were reviewed by President Avila Camacho, Minister of National Defense Gen. Lázaro Cárdenas, United States Chief of Staff Gen. George C. Marshall, Coordinator of Inter-American Affairs Nelson Rockefeller, and the representative of the president of Cuba, Gen. Manuel Benítez. At that time the latest inductees were marched by the reviewing stand as symbols of the rapidly growing Mexican army.

Rearming and preparing its western coast for defense against possible Japanese attack also occupied much of Mexico's attention in 1943. Mazatlán became a war district. Manzanillo was converted into a naval base by the ministry of marine, under Gen. Heriberto Jara, secretary of navy. Furthermore, many naval installations and refuelling stations were established along the western coast line.

Plans for further strengthening the war effort were laid at a meeting of the president of the United States and President Avila Camacho in Monterrey, Mexico in April. One of the most important accomplishments of the conference was the formation of the Joint Commission for Economic Co-operation, consisting of two representatives from each country. Other projects were discussed, including the progress of Mexico's various war industries.

Railroads caused great concern in Mexico during 1943. With neglected roadbeds, insufficient rolling stock, and old and inadequate locomotives, railroad difficulties became constantly more acute. A United States commission, headed by Oliver M. Stevens, was appointed to assist in solving the problem. Safety measures, such as speeds compatible with the state of the roadbed, more efficient control over train movements, and a continuous inspection of the tracks were adopted as a result of suggestions by the commission. Some contracts for materials were negotiated, but clearance for deliveries was delayed.

Part of Mexico's difficulty in adjusting to a war economy lay in her foreign trade. Exports, mostly destined for the United States, so consistently outstripped imports that a very heavy reserve of dollar credits accumulated. Total imports and exports

reached a new high of 1,744,400,000 pesos in 1942, and preliminary counts indicated that the 1943 figures would be even higher. The danger of inflation from the large dollar credits appeared very real to the heads of the National Bank of Mexico.

War plans in agriculture were especially successful in 1943. Although Mexico did not produce as much as it consumed, there was nevertheless a remarkable improvement in agricultural matters. Upon entrance into the war, a plan for mobilizing agriculture in the republic of Mexico was instituted. The results of the 1942 program were very satisfactory in that the plan was surpassed by 1,316,510 ac. under cultivation. The grand total stood at 16,595,930 ac. of which 148,200 were newly placed under irrigation. The total crop production exceeded the plan in a similar manner. During 1943 heavy yields were also obtained, even though the weather was very unfavourable.

To assist both industry and agriculture, Foreign Minister Ezéquiel Padilla had some success in negotiating for allocations of machinery to Mexico. United States machines and equipment made idle by war industries could be put to use in Mexico. Also, a more liberal quota of farm machinery for the agriculture program was obtained.

Industry was greatly stimulated by the war effort. In order to improve planning, two United States engineers were engaged to make a survey of the general business structure. The establishment of plywood plants, paper mills, a high-octane refinery, iron and steel plants all marked the move toward industrialization. Also, a special bid was made for United States capital by Mexico's consul general in New York city. As a result, a new investment trust was formed in May 1943 composed of United States and Mexican financiers.

Of significance surpassed by no other part of its economic life was Mexico's mining industry. Production of strategic metals including zinc, copper and silver increased or stayed firm. Petroleum, however, caused some concern. (See *Mineral Production*, below.)

Increased economic activity brought a rapid rise in prices in Mexico. Wholesale prices reached a high in 1943 of 162% of the 1929 average, and retail prices rose even more. Real estate values and stock market prices went up even faster, causing considerable concern to the officials attempting to curb inflation.

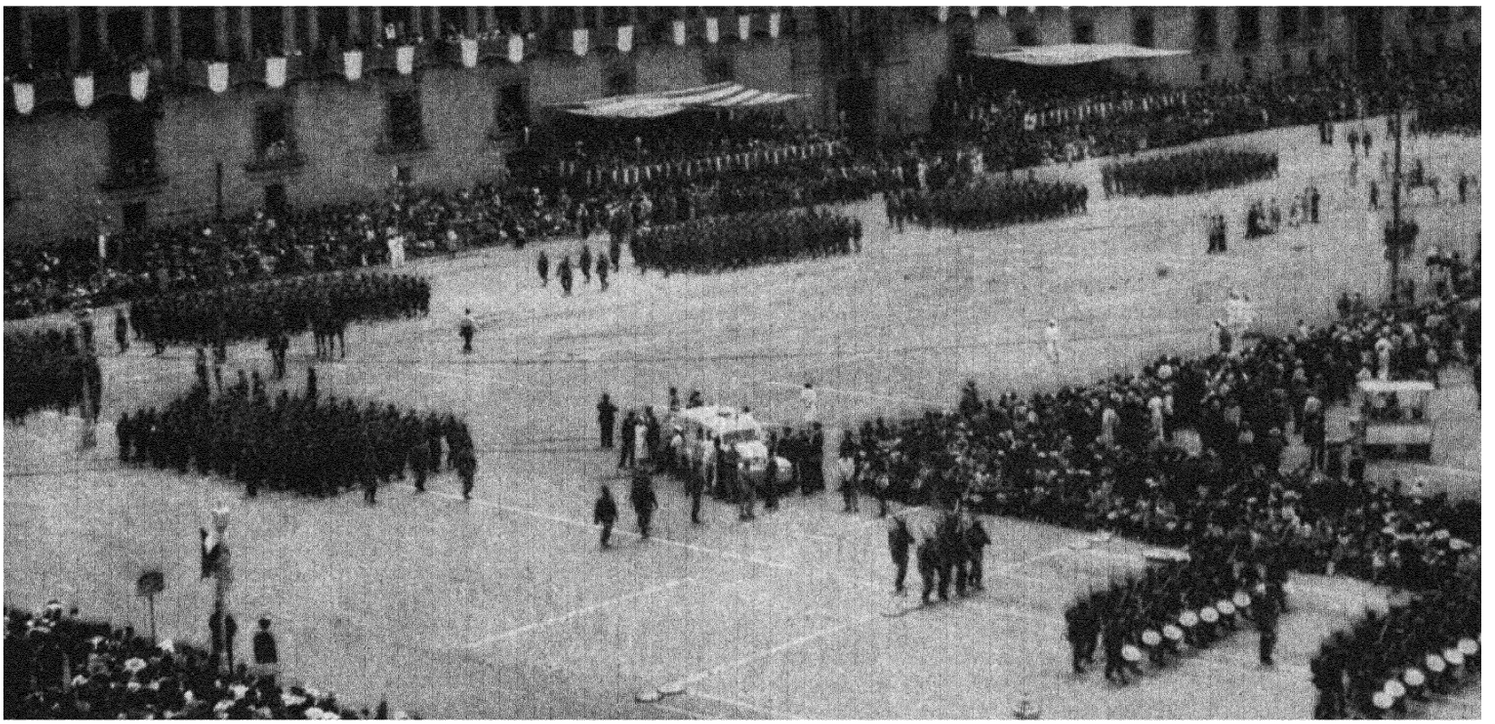
Price control measures were put into effect for many items. Farm produce, foodstuffs, cloth, toilet articles and automobile tires were included on the list. In order to control the grain market, an association of merchants with the Federal Office of Distribution under the ministry of agriculture and economy was established. The country was divided into economic zones, in which, in co-operation with state governments, the association bought and sold grain so as to maintain a stable market.

Another method of holding off inflation was attempted by the sale for peso bank notes of especially minted gold coins (without legal tender value). The purpose of the drive to sell gold was to reduce the amount of paper money in circulation and to absorb some of the new purchasing power of the country. Similarly, a 200,000,000 peso government loan was floated to take care of the increasing surplus of credits. Both financial attempts met with marked success.

Politics, despite the stresses of wartime living, continued in much the same vein as previously. On July 4, 1943, a new chamber of deputies was elected. Again the official party of the Mexican Revolution (P.R.M., *Partido de la Revolución Méxicana*) held the overwhelming majority. During July and August the electoral college considered the cases of the various candidates whose elections were disputed. When the chamber of deputies was installed, 144 of the 147 new representatives were of the official party. None of the independent candidates represented either of the principal opposition parties, the rightist *Acción Nacional* and the communist *Liga de Acción Política*.

The slow shifting of the president, and with him Mexico's politics, to a centre-of-the-road policy was demonstrated in many ways. The supreme court especially supported the politics of the president in moderating some of the more drastic laws. However, small landowners who had received expropriated property were assured that their rights would be protected, and that the *ejidos* (communal lands) would be left untouched.

A more conservative note was sounded when Octavio Vejar Vásquez succeeded leftist Luis Sánchez Pontón as minister of education. Vejar Vásquez was held to be both conservative and a strong supporter of the church. He abolished co-education in Mexican schools and also ordered all school teachers to abandon their political activity.



Similar trends were shown in labour. Vincente Lombardo Toledano was replaced as secretary of Mexico's most powerful trade-union alliance (the C.T.M.) by Fidel Velázquez. Lombardo Toledano still maintained, however, his control over the Confederation of Latin American Workers.

One group in Mexico's population which was making a significant contribution economically and socially was the Spanish refugee. Almost every trade, profession and walk of life was represented by the Spanish elements, who were slowly fitting themselves into Mexican life. The refugees had proved to be an important counterbalance to the pro-axis and anti-United Nations Spanish Falange. Various parties and subdivisions of the Spanish refugees were welded together as the Democratic Spanish union. The union was headed by Antonio Velao, liberal Republican minister in the former Spanish government. A focal point for the Spanish refugees was thus provided. In order to give greater support to the war effort, the newly organized Spaniards offered a battalion of trained, disciplined, and well officered troops to President Avila Camacho.

Another step in the unifying of the Spanish refugees was undertaken when Spanish Republicans elected Diego Martínez Barrio as president of a government-in-exile. The new government, although challenged by other refugee groups, principally in London, asked for formal recognition. However, the Martínez Barrio group was destined for disappointment, for in Nov. 1943 it was decided that a Spanish government could not be allowed in Mexico under the constitution. Some support was given to the new movement when one week earlier a Committee of San Sebastián (named from the place in Spain where the Revolutionary committee was formed to begin the Spanish republic) was created for the purpose of overthrowing the Franco regime in Spain. This committee was supported by the chiefs of all Mexican parties, except the communist.

Relations with the United States were better during 1943 than at almost any other time in the history of Mexico. Much of the credit for this circumstance was given to Foreign Minister Ezéquiel Padilla. A reciprocal trade agreement with the United States was put into effect on Jan. 30. Arrangements were made whereby workers were furnished United States areas suffering labour shortages, and even the oil question was largely solved. The biggest United States claimant, Standard Oil of New Jersey, accepted on Oct. 1, 1943, $22,000,000 awarded under the agreement.

Of more local concern to Mexico was the extensive health program, begun in 1936, which received special impetus after the entrance of Mexico into World War II. Victor Fernández Manero directed the program as head of the department of public health. Educational programs were undertaken, and public and group medical care was provided. Regional sanitariums, hospitals and medical centres were developed. In addition to the civil-

SOMEWHAT REMINISCENT of Russia's May Day celebration were the huge festivities in commemoration of Mexican independence before the national palace at Mexico City Sept. 16, 1943

ian facilities, a network of military hospitals was built under the direction of Gen. Ignacio Sánchez Neira of the ministry of national defense.

Closely allied with the public health program were the plans advanced by the United States to spend $1,178,000 on health projects along the Pan-American highway. Water and sewage service for the towns along the highway accounted for most of the expenditure. Methods of combating blindness and tropical diseases occupied the remainder of the budget.

Construction on the Pan-American highway continued. Progress was mostly in the area south of Mexico City, pressing towards the Guatemala border. Steep mountainous country and volcanic rock caused most of the engineering difficulties.

A colourful addition to life in Mexico City came with the construction of the new *Hipódromo de las Américas* track for horse racing. The track occupied an important place in the social life of the Federal District, although some criticism from labour circles was levied at the display at the Hipódromo.

Perhaps the most dramatic incident of 1943 in Mexico was the sudden eruption of a new volcano in the fields near San Juan Parangaricutiro in the state of Michoacan. The volcano rose from the level fields in less than a week, beginning on Feb. 20, to a height of over 140 ft., and threatened the village of Parangaricutiro with a flow of lava almost 50 ft. high. However, after a week the volcano subsided in activity, and the flow of lava ceased.

Education.—Education is free, compulsory and divorced from religion. Private schools, however, are allowed to teach religion, and officially the government in 1943 was more lenient toward the church than formerly. Mexico had approximately 25,000 primary schools with over 2,000,000 enrolment. Secondary schools in 1942 had about 80,000 enrolment and the country's ten universities around 30,000. There were more than 100 technical schools, including 30 vocational agricultural schools for Indians and 91 for adult education. Illiteracy was estimated at a little less than 45%. Rural education was supported by the federal government, urban by the states and municipalities.

Finance.—The monetary unit is the peso (value in 1943 approximately 20.65 cents U.S.). In 1943 bank circulation rose to 2,585,600,000 pesos and reserve bank deposits to 650,000,000 pesos (250,000,000 pesos in Aug. 1942).

In line with Mexico's war activities the 1943 budget as presented by Finance Minister Eduardo Suárez was the largest in the financial history of the country. A total of 707,845,000 pesos was appropriated. To national defense went 177,300,000 pesos, education, 97,200,000 pesos, public debt, 95,500,000 pesos, agriculture and development, 94,900,000 pesos, presidency, 1,400,000 pesos. Bonds for 125,000,000 pesos were authorized of which 100,000,000 pesos were earmarked for highways and 25,000,000 pesos were designed for railroad rehabilitation. On the other side of the ledger, taxes on income, liquor, petroleum and gasoline were substantially increased.

Indicative of the boom times were the effects on the treasury. Receipts for 1942 were approximately 900,000,000 pesos, and investors in Mexico's foreign loans began receiving payments in July after a default of 15 years.

Trade and Communication.—Exports in 1943 exceeded imports until September, when imports and exports became approximately equal. Preliminary estimates were that the total volume of imports and exports in 1943 would be greater than the record year of 1942.

Exports in 1942 totalled 991,900,000 pesos (728,800,000 pesos in 1941). This was even higher than the 1940 peak of 960,000,000 pesos. Gold, silver, copper, lead, zinc and oil comprised the bulk of Mexico's export goods. Beef, henequen, tomatoes and *huaraches* (sandals) also stood high on the export list. Chicle, coffee, chick peas, cotton, vanilla, guayule, vegetable wax and fodder were also exported in appreciable quantities.

Imports in 1942 were 752,500,000 pesos (914,500,000 pesos in 1941 and 668,400,000 pesos in 1940). Manufactured articles, including machinery, composed the largest single category of imports. Some food was also imported during 1943. The above figures do not include munitions of war.

External communications are by sea, especially through Veracruz; by three main railways to the United States and one to Guatemala; by air to all parts of the hemisphere; and by a growing network of motor highways.

The national railway system (14,500 mi.) linked the more important population and industrial centres. There were more than 36,000 mi. of improved roads in 1942, of which 4,500 mi. were paved.

Agriculture.—Mexico has an estimated 37,050,000 ac. of tillable land, of which 13,410,556 ac. were under cultivation in

1940 and 16,595,930 ac. in 1942 (3.5% of the total area of the country). Forest land comprised 25,893,993 ac. and grazing land 69,713,715 ac. In 1940 (census) there were 26 irrigation districts comprising 6,774,988 ac. of which 2,057,115 ac. were irrigable, and 1,101,208 ac. were under actual irrigation. In 1942 an additional 148,200 ac. were brought under irrigation.

Agricultural production in 1942 was (in short tons): 2,590,405 tons of maize, 552,252 tons of wheat, 511,467 tons of refined sugar (1943), 123,458 tons of rice (154,322 tons estimated for 1943), 205,028 tons of beans, 303,133 tons of bananas, 170,061 tons of tomatoes, 186,289 tons of cotton seed, 91,491 tons of chick peas, 93,696 tons of sesame, 44,092 tons of pineapple (marketed), 19,841 tons of grapes, 59,524 tons of coffee, 122,355 tons of henequen, 6,614 tons of chicle, 66,138 tons of guayule (7,716 tons only had been forecast).

Timber produced in 1942 was: 35,315,000 cu.ft. of pine, 1,317,250 cu.ft. of mahogany, 1,045,320 cu.ft. of red cedar, 432,600 cu.ft. of white cedar, 91,820 cu.ft. of primavera. Charcoal, resins and other products equalled 45,600 tons.

Manufacturing.—During 1943 the expansion of Mexican industry continued. A high-octane refinery was established. Certain new industries such as plywood and pulpwood were begun, and a Mexican-United States group of financiers undertook the establishment of branches of certain United States manufacturing firms in Mexico. Employment was high and prices were rising.

Mineral Production.—Basic to Mexico's economy is mining. In 1942 Mexico ranked first in world silver production, second in lead and fourth in gold. Total production of precious metals was 2,937 tons valued at 291,322,422 pesos; of industrial metals was 621,187 tons at 446,522,197 pesos; and of metalloids was 47,734 tons, at 16,493,043 pesos. Of this amount, 519,000 tons were classed as strategic war metals. Silver production in 1942 was 74,000,000 oz., most of which was purchased by the United States.

Petroleum production continued to decline. Total production of crude in 1941 was 43,304,179 bbl. as against 34,813,659 bbl. in 1942. Even more drastic reduction was noted during 1943. Statistics for 1942 were: six new producing wells with a daily initial capacity of 15,051 bbl.; exports, 6,540,889 bbl.; consumption, 28,490,033 bbl.; petroleum derivatives, 40,513,155 bbl. Mica. Consumption of high-grade mica sheets in the United States during the first eight months of 1943 was more than 50,000 lb. monthly in excess of receipts, and depletion of stocks was so heavy that in October further restrictions on use were announced, under which consumption from Dec. 1 was restricted to the rate during the first three quarters of 1943. However, the grades below "good stained" were more plentiful; stocks of "stained" mica increased during the same period from 370,000 lb. on Jan. 1 to 1,160,000 lb. on Aug. 1, 1943. A new buying schedule was put into effect in May, designed to encourage greater production of small sizes. (G. A. Ro.)

Michigan. One of the north central group of states, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine state." Area, 97,940 sq.mi. (including 39,960 sq.mi. of Great Lakes' water surface); pop. (1940) 5,256,106; 3,454,867 were urban, 1,801,239 rural. Whites comprised 95.9% of the population, nonwhites 4.1% (215,934). Capital, Lansing (78,753). Larger cities were Detroit (1,623,452), Grand Rapids (164,292), Flint (151,543), Saginaw (82,794).

History.—War production continued to play the dominant role in Michigan history in 1943. Population congestion in the Detroit area continued, constituting an important factor in bringing on the most significant event in 1943 Michigan history: the race riot which broke out in Detroit on the evening of Sunday, June 20. (*See* DETROIT; RACE RIOTS.)

The legislature convening in regular session in Jan. 1943 and ending March 26 was composed of 25 Republicans and 7 Democrats in the senate, 73 Republicans and 27 Democrats in the house of representatives. Despite the fact that a considerable portion of the session—shortest since the Civil War—was devoted to argument over the question of return to standard time and to futile attempts to reorganize state highway administration, the legislature passed 265 measures, 9 of which were vetoed by Gov. Harry F. Kelly. Appropriations totalled $137,000,000; a six-member state commission of labour and industry was created; for the first time since 1925, seats in the house of representatives were reapportioned; a new compilation of Michigan statutes (first since 1929) was ordered; the Michigan council of defense, created early in 1941, was abolished, and the direction of its system was transferred to one man, a director of civilian defense (Gov. Kelly appointed Capt. Donald S. Leonard to this position); and for the first time in 30 years, the workmen's compensation law was revised. Gov. Kelly's program for the "streamlining" of the government by the merging of departments was deferred. However, considerable authority for the consolidation of state agencies was entrusted to the newly created department of business administration, to the headship of which Gov. Kelly named Robert S. Ford, director of the University of Michigan's bureau of government. An effort in the legislature to reverse Michigan's century-old anti-capital punishment position failed of success.

In the April 1943 election, Republican candidates for state offices were uniformly successful: R. Spencer Bishop and Ralph A. Hayward were chosen regents of the University of Michigan; Eugene B. Elliott, superintendent of public instruction (re-elected); Stephen S. Nesbit, member of the state board of education (re-elected); W. G. Armstrong and Sarah Van Hoosen Jones, members of the state board of agriculture; Charles M. Ziegler became the first Republican in 10 years to win the position of state highway commissioner. In the nominally nonpartisan election of justices of the state supreme court, Neil E. Reid and Emerson R. Boyles, endorsed by the Republicans, were successful, though the latter's plurality over Democrat-endorsed Burt D. Chandler was only 2 votes in a total of over 350,000, making this election the closest of any for state office in Michigan's entire history.

Recurring charges of corruption in state legislatures led, late in the summer, to the initiation of a one-man grand jury investigation under the direction of Judge Leland W. Carr. Two other events of importance during 1943 were court martial proceedings following the shooting of a Negro private by the commandant of Selfridge field, and the completion of the MacArthur lock in the St. Mary's ship canal at Sault Sainte Marie.

Education.—There were 5,260 elementary schools and nearly 800 secondary schools in the state public school system with a total enrolment of about 950,000 pupils; their teaching staffs numbered 32,492 members. The 1943 legislature appropriated $50,000,000 for the support of the public schools.

Public Welfare, Charities, Correction.—The State Social Welfare commission reported that the general relief load decreased 39.6% from Nov. 1942 to Nov. 1943, as compared with

a decrease of 39.0% from Nov. 1941 to Nov. 1942; the active load of persons receiving relief was 21,153 during Nov. 1942; 12,785 during Nov. 1943. During Nov. 1942, 90,082 persons received old-age assistance; during Nov. 1943, 87,784; during this period the total number of families receiving aid to dependent children decreased from 18,198 to 13,719; recipients of aid to the blind declined in number from 1,369 to 1,290. For all programs, a total of $40,930,465.36 was expended in assistance from Dec. 1942 to Nov. 1943. Of this, 38.5% represented federal participation, 53.6% state participation and 7.9% local county participation.

The 10 state institutions supervised by the Hospital commission cared for nearly 21,000 patients in 1943, committed to custody because of mental illness or deficiency. Three prisons conducted by the Corrections commission had a population of more than 7,200 in 1943, including the State Prison of Southern Michigan.

Communication.—With state highway department revenue dropping from $31,704,320 in 1942 to approximately $22,000,000 in 1943 and heavy increases in maintenance costs, highway building was considerably restricted in 1943. Chief expenditures in a $15,500,000 construction program were devoted toward the completion of the Detroit-Willow Run expressway and access roads in war production areas, with the federal government providing from 50% to 75% of the funds. Michigan in 1943 had some 9,400 mi. of trunk line highways and more than 88,000 mi. of county roads. A wartime "production miracle" was the completion, early in the summer, of the great new MacArthur lock in the Soo canal. Despite the shortening of the shipping season by a month, because of weather conditions, 85,000,000 tons of iron ore passed through the canal; 28% more wheat, 76% more in other grains, 21% more soft coal passed through than in 1942.

Banking and Finance.—On Oct. 18, 1943, the total resources of the 345 state commercial banks and 4 industrial banks amounted to $1,586,265,957.74, showing an increase of 2.3% since the first of the year; the deposits of state banks had reached an all-time peak.

As of Dec. 21, 1943, 94% of the average deposit dollar impounded during the banking holiday period of 10 years before had been returned to the depositor-creditors.

Agriculture.—A 57-year record rainfall during the planting season brought widely varying effects to production records in the chief crops raised by Michigan's 168,000 farmers. Oats, corn, wheat and barley suffered heavily.

Table I.—*Leading Agricultural Products of Michigan, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	52,604,000	69,703,000
Oats, bu.	35,053,200	67,410,000
Wheat, bu.	11,200,000	16,322,000
Barley, bu.	3,792,360	7,293,000
Navy beans, 100-lb. bags	5,310,000	4,832,000
Potatoes, bu.	22,365,000	16,562,000
Buckwheat, bu.	800,000	391,000
Eggs	1,412,000,000*	1,319,000,000*

*First eleven months.

Manufacturing.—An enormous increase in manufacturing took place in 1943; the previous year had seen new processes undertaken for war production; 1943 witnessed impressive accomplishment in the form of production completed. Because of war conditions, official statistics are not available beyond 1939. In that year the total value of manufactures was $4,348,223,244. Figures released by the War Production board in September revealed that of a total of $109,886,573,000 in major war supply contracts to that date, Michigan's share was $11,469,576,000, or 10.5%, placing it ahead of every other state in this respect.

Mineral Production.—As in 1942, war-production needs stimulated increase in the development of Michigan's varied mineral resources in 1943. Fifteen oil and gas discoveries were made during the first 11 mo. of 1943, although no large pools or fields were found.

Table II.—*Principal Mineral Products of Michigan, 1941 and 1940*

Mineral	Value, 1941	Value, 1940
Iron ore	$43,765,164	$40,474,951
Petroleum	21,900,000	20,150,000
Pig iron	21,384,383	18,472,588
Coke	18,213,048	15,445,452
Cement	13,333,850	11,389,191
Salt	10,975,872	7,479,905
Copper	10,959,840	10,214,748
Natural gas	8,722,000	8,330,000
Gypsum	1,000,309	1,017,126

During the year the producing oil wells on state property numbered 192; gas wells, 15; they yielded $900,000 to the general fund of the state.

Michigan, University of. During 1943 the teaching facilities of the University of Michigan were increasingly utilized for instructing military and naval personnel while the enrolment of civilian students declined. A Division for Emergency Training was organized in Dec. 1942, to negotiate with government agencies, arrange and manage the courses, and a number of units were introduced in Jan., March, and April 1943. For the army the university taught engineering, pre-meteorological subjects, languages, civil administration and several specialized medical subjects, such as thoracic surgery, epidemiology and medical laboratory techniques; the Judge Advocate General's school was moved to Ann Arbor in Sept. 1942. The navy, marine and coast guard contingents were mostly in the basic, pre-medical and engineering curricula of the navy V-12 course, and practically all the medical and dental students were enlisted in either the army or the navy. The navy's postgraduate school of naval architecture was brought to Ann Arbor from Annapolis in July 1943. In addition there were offered throughout the year a great number of courses for civilians to meet war conditions, including basic science for student nurses, a course for tabulating machine supervisors, and those classed as Engineering, Science and Management War Training courses. Between July 1942, and Aug. 1943, 1,649 persons were enrolled in full-time courses of this character and 2,671 in part-time courses. Nearly 200 research projects were carried on for government agencies and war industry. The School of Public Health occupied its new building in May and June 1943. For statistics of enrolment, etc., *see* UNIVERSITIES AND COLLEGES.

Mikhailovitch, Draja (1893–), Yugoslav army officer, was born in Shumadija, a village near Belgrade. He fought in the Balkan War, 1912–13, and in World War I. He saw action on the Salonika front, was thrice wounded, decorated for bravery and was promoted to a captaincy. He then attended the higher military academy and the general staff school. After the swift nazi conquest of Yugoslavia in April 1941, Mikhailovitch fled to the mountains, where he rounded up scattered Yugoslav detachments and welded them into a guerrilla force of considerable strength. His initial operations were successful and he was rewarded with the post of minister of

war in the Yugoslav government-in-exile, Jan. 1942. In early 1943, Mikhailovitch restricted his operations against the Germans, and his Chetniks clashed frequently with the Yugoslav partisans, a rival organization. Mikhailovitch was widely publicized abroad, but within Yugoslavia his intense Serb nationalism repelled rather than attracted popular support from the heterogeneous racial elements in the country; as a result his armies fell to less than 25,000 in numbers, while the partisans boasted more than 200,000 guerrillas in their ranks. The partisans, who consistently charged that Mikhailovitch had "sold out" to the axis, not only won the bulk of popular support in Yugoslavia but backing from the Allies as well. King Peter II admitted, Oct. 16, 1943, that Mikhailovitch was not doing "sufficient fighting" against the Germans, but declared that the Chetnik leader had promised to activate his military operations and had agreed not to fight the partisans.

Mikolajczyk, Stanislaw (1901–), Polish politician, was born in Gelsenkirchen, Germany, the son of a farm labourer who emigrated from Poznan province in western Poland to find work in the Westphalian mines. The family returned to Poland, where Mikolajczyk as a youth found work in a sugar-beet factory, and became active in political organizations. He was wounded during the Russo-Polish war in 1920. After the war, he entered politics and at the age of 29 was elected to the sejm, serving from 1930 to 1935. He was vice-president of the Polish Peasant party and was made its president in 1937. When the nazis invaded Poland in Sept. 1939, he saw military action in the unsuccessful defense of Warsaw. He fled to Hungary, where he was interned, but later escaped to France. He became President Ignace Paderewski's deputy in the Polish parliament in exile and upon the latter's death succeeded to the presidency. In 1941, he was appointed minister of home affairs and deputy prime minister in Premier Sikorski's government-in-exile. He became prime minister when Sikorski was killed in a plane crash, July 5, 1943. In his first address before the Polish national council, he affirmed the "historic necessity" for collaboration with soviet Russia. He insisted, however, upon restoration of all territory within Polish borders before the war.

Milk. Total milk production in the United States in 1943 was estimated at 118,000,000,000 lb. by the United States department of agriculture, compared with the record production of 119,240,000,000 lb. in 1942 and 107,903,000,000 lb. for the average of 1937–41. The need for milk could not be met by this amount of production because of the great increase in demand by civilians for fluid milk and for military and lend-lease uses. The War Food administration had set 122,000,000,000 lb. as the goal, but because of a lower return per cow this goal was not attained. This was due to less favourable prices for milk compared to the cost of feed and the limited supplies of feed in some dairy regions. The number of cows continued to increase.

The production of cheese and other manufactured products declined in 1943 because of the strong demand for fluid milk. Civilian per capita consumption of all major dairy products was reduced below the prewar averages in 1943. Consumption of fluid milk in cities in 1943 was estimated to be 15% above the 1942 level and 34% above the 1935–37 average. The government moved in early fall to develop a payment program to stop the downward trend in milk production and to raise it if possible. Payments amounting to 30 to 50 cents per 100 lb. were offered dairymen. The rates were higher in areas where the quantity of purchased feed was large and feed costs advanced the most, and also where milk prices were low just preceding the war. Limitations of milk sales were ordered by the War Food administration in some markets. The feed shortage in New York's milkshed led the state government to protest vigorously to the national authorities to move feed supplies into the area. A severe shortage of milk in New York city was forecast for 1944. The drought in the summer of 1943 reduced the supply of dairy feeds in the middle Atlantic coast states and cut down milk production until late fall when feed wheat and other grains were shipped into the area. The price of milk was at such levels that the cash farm income from milk and dairy products was expected to be 20% higher for 1943 than 1942. Farm costs, wages in particular, were higher in 1943 than in 1942 and the supply of labour much more limited. The demand for milk for civilian uses was estimated to be sufficient to use 120,000,000,000 lb. in 1944. The added needs for military uses, and for relief in Europe, should World War II end in 1944, would greatly exceed the possible production and make strict economies necessary, if not a rationing plan. (*See* also BUTTER; CHEESE; DAIRYING.) (J. C. Ms.)

Millerand, Alexandre (1859–1943), French Socialist and politician, was born Feb. 10 in Paris. During his half-century in politics, Millerand was responsible for the introduction of important social legislation in France. After resigning from the presidency in 1924, he served as senator from 1925 to 1940. He died at Versailles, April 6, according to a Berne report. (See *Encyclopædia Britannica.*)

Millstones: *see* ABRASIVES.

Milyukov, Paul Nikolayevich (1859–1943), Russian politician and historian, was born Jan. 27 in St. Petersburg (Leningrad). A former leader of the liberation movement in Russia and a member of Prince Lvov's provisional government, he fled to Kiev after the bolsheviks seized power and then went to Paris. There he edited a Russian daily newspaper, *Dernières Nouvelles*, and a monthly magazine and continued his writings on Russian history. He died at Aix-les-Bains, France, March 31, according to a Berne report of April 15. (See *Encyclopædia Britannica.*)

Mineral and Metal Production and Prices.

The comparatively few data on production in 1942 have been added to the accompanying tables, supplementing the figures of earlier years which must be used in most cases. A production table including figures scattered over the years 1938 to 1942 is admittedly not particularly desirable, but it is the best that can be done for the war years; while it lacks much of the value of a table made up entirely of figures for the latest year, it at least shows the latest data that have been received for the various countries.

A second table presents the opening and closing price quotations for 1943 on the London and New York markets for the leading minerals, ores and metals. With most of the prices under governmental control, and subject to little if any variation, the former practice of including the high and low prices for the year has been discontinued for the time being, as they would in most cases merely be repetition.

The *Mineral Industry* index of aggregate world mineral production, which has formerly been quoted as a measure of over-all mineral output from year to year, has become a war casualty through lack of sufficient data on which to base calculations, but similar data are available for a few individual countries in the *Monthly Bulletin* of the League of Nations. Even though not directly comparable because of different bases and coverage, the tabulation of the data from the two sources in Table III gives a

NOTES: A figure in braces is for 1941, and one in parentheses is for 1940, 1942 or 1941 data not being available; one in brackets is for a preceding year, 1939, or the latest available. A figure without decimals is an estimate, except with cadmium, mercury, potash and pyrite. The letter "p" indicates a production unknown or smaller than the minimum base of the table, while "P" indicates an output of greater size.

[1]Crude magnesite. [2]K_2O equivalent of salts produced. [3]Mainly crude sulphur, but includes some ore, where sulphur content is not reported; also includes some sulphur recovered from industrial gases, especially from the roasting of sulphide ores. [4]60% WO_3 basis.

rough guide to current progress, the 1943 figures being only for the month indicated.

The U.S. bureau of mines estimated the gross value of mineral output in the United States in 1943 at $8,030,000,000, a rise of 6% over $7,569,000,000 in 1942. Mineral fuels increased 12% in dollar value and metallic products 6%, while nonmetallics other than fuels dropped 14%, largely through the decline in demand for materials used in the building industry.

(*See* also STRATEGIC MINERAL SUPPLIES, and the reviews of the various metals and minerals.) (G. A. Ro.)

Mineralogy. The continued disrupted international conditions forced many mineralogists to suspend, temporarily, investigations which could be published and devote their energies to the war effort. This change in activities and the critical shortage of paper resulted in a reduction in the size or in the number of issues of some important mineralogical journals. Nevertheless, the number of significant publications in mineralogy during 1943 was impressive.

In his address as retiring president of the Mineralogical Society of America, A. F. Buddington discussed "Some Petrological Concepts and the Interior of the Earth," (*American Mineralogist,* March). The new mineral, gamagarite, a vanadium compound of barium containing iron and manganese, from Postmasburg district, Union of South Africa, was described by J. E. deVilliers (*ibid,* May). R. A. Hatch presented data on the phase equilibrium in the lithium aluminosilicate system (*ibid,* Sept.–Oct.), and M. A. Bredig on the phase relations in the calcium orthosilicate-orthophosphate system (*ibid,* Nov.–Dec.). Publications in book form included: (a) *World Minerals and World Peace,* by C. K. Leith, J. W. Furness and Cleona Lewis (Brookings institute, Washington), an important study of the greatly increased production and consumption of minerals and their role in international affairs; (b) *Optical Crystallography,* by E. E. Wahlstrom (New York), a timely and valuable contribution because of the many current applications of crystal optics and the polarizing microscope; (c) *Minerals and Rocks,* by R. D. George (New York) emphasizes mineral economics.

Gem Minerals.—Widely consulted articles on the uses of the diamond appeared in the second "Symposium on Diamonds" (*American Mineralogist,* March), as follows: "Diamond Production," by S. H. Ball; "Gem Diamonds and Their Present Trends," by Lazare Kaplan; "Diamond Dies," by Alexander Shayne; "Diamond-set Tools," by C. B. Slawson, and "Recent Development of Bonded Diamond Wheels," by A. A. Klein. The absorption bands and the luminescence phenomena of the diamond were discussed by B. W. Anderson (*The Gemmologist,* London, Jan., Feb., April). The war greatly increased the use of diamonds in industry and information concerning the variations in hardness in the diamond was of much importance. These variations were reviewed by Paul Grodzinski (*Industrial Diamond Review,* London, Feb.,

March). There was an unprecedented demand for quartz crystals for use as oscillating plates in radio, electronic and other apparatus which are essential in war matériel. During 1943 many specialized articles on various phases of the industrial use of quartz appeared in *Electronics, Communications,* and other technical journals. The production of quartz crystal plates with specified properties was on a large scale and of great strategic importance.

The discussion as to whether or not the diamond had ever been successfully produced in the laboratory was reopened by F. A. Bannister and K. Lonsdale in their article "An X-ray Study of Diamonds Artificially Prepared by J. B. Hannay in 1880" (*Mineralogical Magazine,* London, June). Bannister and Lonsdale studied by modern X-ray methods specimens purported to have been the results of experiments carried on by Hannay, and found that they possessed the properties of the diamond. While the results of this study were not to be questioned, there still remained considerable doubt as to the authenticity of the specimens. Whether or not Hannay actually succeeded in producing diamonds could not be proven conclusively until the methods used by him over 60 years before were repeated with success. (*See* also MINERAL AND METAL PRODUCTION AND PRICES.)

Minnesota. A north central state of the United States, popularly known as the "Gopher state." Area, 84,068 sq.mi., of which 4,059 are water. Pop. (1940) 2,792,300. The rural population was 50.2% of the total. Capital, St. Paul (287,736). The only city in the state with a larger population was Minneapolis (492,370); Duluth had 101,065. The native-born white inhabitants in 1940 numbered 2,474,078, foreign-born, 294,904 and Negro, 9,928.

History.—Officers of the state in 1943 were: governor, Edward J. Thye; secretary of state, Mike Holm; treasurer, Julius A. Schmahl; auditor, Stafford King; attorney general, J. A. A. Burnquist; and chief justice, Henry M. Gallagher. Harold E. Stassen, who was serving his third term as governor, resigned to enter the United States navy. Edward J. Thye, lieutenant governor, was sworn in as governor in April 1943.

The 1943 session of the legislature passed more laws (666) than any Minnesota legislature since the adoption in 1891 of the constitutional amendment prohibiting special legislation. Much of this increase was due to the tremendous number of salary increase laws, made necessary by the rise in the cost of living.

A war-powers act was passed giving the governor special emergency powers. A state department of aeronautics was established and charged with the licensing of pilots and the administration of the airport laws. The Metropolitan Airport commission was created to develop airports for the Twin Cities. A number of laws were passed for the relief of servicemen, and a fund of $2,500,000 was to be set aside to aid returning war veterans and their families.

Other legislation included acts establishing the Iron Range and Rehabilitation commission, to recommend approval of expenditures and projects for rehabilitation purposes. Occupation and royalty tax on iron ore was increased from 9 to 10½% for the two-year period beginning July 1, 1943.

The income tax law was revised, and the act increased the credit of unmarried persons to $10 and of married persons to $30. The allowance for dependents was increased from $5 to $10. The money and credit tax was completely suspended for 1943–44 and no returns were required for those years. Old-age pensions were increased to $40 instead of $30, and aid to dependent children was also raised. The unemployment compensation law was revised to raise the maximum benefits from $16 to $20 a week. An act to extend workmen's compensation to cover all occupational diseases instead of the restricted list on the statute books was passed. Real estate levy was cut from 9 mills per year to 6 mills the first year of the biennium and to 5½ the second year.

EDWARD J. THYE, Republican, was sworn in as governor of Minnesota in April 1943 to succeed Harold E. Stassen, who had resigned to enter the U.S. navy

Education.—In 1942–43, Minnesota had 8,257 elementary, 660 secondary schools, and 13 junior colleges. Enrolment was 315,224, with 12,546 teachers in the elementary grades; 178,807, with 7,953 teachers in the secondary grades; 1,900, with 152 teachers in junior colleges; 8,063 in adult-education classes, with 257 teachers; and 478 in teacher training departments, with 36 teachers. The total public school expenditure for 1942–43 was $54,787,998.

Public Welfare, Charities and Correction.—During the year ending June 30, 1943, $3,394,721 was spent on general relief, the average number of cases being 12,250; on old-age assistance, $17,193,116, the average number of recipients being 61,938. A total of $3,340,104 was spent on dependent children; this sum cared for an average of 7,803 families and 18,881 children. An average of 1,025 persons received $356,526 as aid to the blind. For the same period, the state prison, two state reformatories, and two training schools for delinquents had a total of 2,491 inmates and an aggregate expense of $1,377,081. Unemployment compensation paid out was $2,192,350 in 1943, compared with $6,531,939 in 1942.

Communication.—Highway mileage totalled 11,247 at the end of 1943. Railway mileage at the end of 1941 was 8,365. There were 29 airports and landing fields in the state and 7 seaplane bases and anchorages in 1941.

Banking and Finance.—On July 1, 1943, there were 484 state banks, one mutual savings bank, and four trust companies in Minnesota with deposits of $457,624,607 and resources of $497,328,152; 185 national banks with deposits of $1,310,906,000 and resources of $1,399,324,000; 44 building and loan associations with resources of $39,251,825. The state revenue and expenditure for the year ending June 30, 1943, were as follows: receipts, $33,991,346 plus transfers, warrants cancelled, and cash balances, making an available total of $57,391,493; payments, $44,170,492, plus transfers and adjustments, making a total of $49,301,125; balance, $8,749,986. The unpaid bonds and certificates of indebtedness on June 30, 1943, totalled $98,770,284. The state's four principal trust funds as of June 30, 1943 totalled $125,837,239.

Agriculture.—In Minnesota the cash income from farm marketings for the first seven months of 1943 totalled $451,674,000 compared with $349,103,000 in 1942.

Manufacturing.—Official figures later than 1939 were not available in 1943. According to the U.S. biennial census of manufactures in that year, there were 4,008 manufacturing establishments, employing 92,084 persons. Wages earned amounted to $125,442,031 and the output was valued at $845,771,514.

Leading Agricultural Products of Minnesota, 1943 and 1942

Crop	1943 (est.)	1942
Corn, all, bu.	195,619,000	207,190,000
Oats, bu.	160,099,000	177,567,000
Barley, bu.	35,490,000	50,327,000
Wheat, all, bu.	17,814,000	23,170,000
Potatoes, bu.	17,710,000	19,380,000
Flaxseed, bu.	17,700,000	15,950,000
Tame hay, tons	5,413,000	5,473,000
Rye, bu.	1,784,000	3,345,000

Mineral Production.—The 1943 output of iron ore in Minnesota was estimated at 83,655,340 tons. A late opening of interlake navigation resulted in delays in getting the iron ore movement at maximum of capacity.

BIBLIOGRAPHY.—Minnesota *Legislative Manual*, 1943. (L. BE.)

Minnesota, University of.

An institution of higher education at Minneapolis, Minn. Enrolment of regular collegiate civilian students, which reached a peak of 15,807 in 1939, continued its decline in 1943. Because of army and navy trainees, however, the total number receiving instruction on the campus was slightly larger than in 1942. Women constituted 79% of the freshmen. The school of nursing, in the fall of 1943, enrolled the largest number of students in the cadet nurse corps of any institution in the U.S. During the years the Board of Regents extended the term of President Walter C. Coffey to June 30, 1945—one year beyond the normal retirement age and also created two vice-presidencies, academic and business. Dr. Errett W. McDiarmid from the University of Illinois assumed the post of librarian, replacing Frank K. Walter, who retired after 27 years of service. Gifts to the university during the year totalled $1,015,686.13. Staff members on leave for service in the armed forces or for other war-related work totalled 569 through Nov. 20, 1943; of this total, 288 were from the academic staff. (For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.) (W. C. C.)

Missions, Foreign.

In 1943 additional developments were brought to foreign missions, both Roman Catholic and Protestant, in consequence of the world-wide war. Yet these were not as sharp or as startling as had been those of the earlier years of the conflict. This was largely because the area of the conflict had already reached its widest dimensions and the tide of axis invasion and occupation had become stationary and here and there had been forced into recession. More missionaries were repatriated from Japan and from the portions of China occupied by the Japanese. There was little or no repatriation from some of the Japanese occupied lands, notably the East Indies. Japanese Christians, both Roman Catholic and Protestant, increased their efforts to effect close relationships with their fellow believers in the vast territories held by their country's armed forces. In spite of the difficulties of transportation, scores of new missionaries were being sent from the United States and the British Isles to South America, Africa, India and free China. A few missionaries who had been on furlough or who had been driven out by war managed to make their way back to their fields. If that field had been in China, it was, of course, to free and not to occupied China that they returned. In Great Britain and the United States giving to missions increased. From the Protestants of these lands, largely through the Orphaned Missions fund of the International Missionary council, remittances were maintained to Protestant missionaries from the continent of Europe who had been cut off from their supporting constituencies. Similarly, in the United States the provinces of various Roman Catholic orders continued to come to the assistance of the missions of the European provinces which had been cut off from their overseas missions. In Protestant circles in the United States there was much planning for the postwar years.

(K. S. L.)

Mississippi.

A southern state of the U.S.A., admitted to the union in 1817, popularly known as the "Magnolia state"; area, 47,716 sq.mi. (47,420 sq.mi. land and 296 sq.mi. water); pop. (1940), 2,183,796; capital, Jackson (62,107). Other cities: Biloxi (17,475); Greenville (20,892); Gulfport (15,195); Hattiesburg (21,026); Laurel (20,598); Meridian (35,481); Natchez (15,296); Vicksburg (24,460). Of the state's population in 1940, 432,882, or 19.8%, were urban. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,177,324 native born; 6,472 foreign.

History.—For 1940–1944 the elected officers of the state were: governor, Paul B. Johnson; lieutenant governor, Dennis Murphree; secretary of state, Walker Wood; attorney general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Lewis S. May; superintendent of education, J. S. Vandiver; state auditor, J. M. Causey. In the Aug. 24, 1943 primary, Thomas L. Bailey with 143,153 votes defeated Former Governor Martin S. Conner with 125,882, for the office of governor. For 1944–1948 the elected officers of the state, chosen in the Democratic primaries in Aug. 1943, were: governor, Thomas L. Bailey; lieutenant governor, Fielding L. Wright; secretary of state, Walker Wood; attorney general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Newton James; superintendent of education, J. S. Vandiver; state auditor, Bert J. Barnett. On Dec. 26, 1943, Governor Paul B. Johnson died at his home in Hattiesburg, and was immediately succeeded by Lieutenant Governor Dennis Murphree for the duration of his unexpired term.

THOMAS L. BAILEY, Democrat, elected governor of Mississippi Nov. 2, 1943

Education.—In 1943 there were 1,319 white elementary schools in Mississippi and 3,637 Negro elementary schools, a total of 4,956. The enrolment in elementary schools in 1942–1943 was 512,959, of whom 235,508 were whites and 277,451 Negroes. The state had 575 white high schools and 100 Negro high schools, with a total enrolment of 74,344. There were 9,530 white elementary and high school teachers, and 6,879 Negro elementary and high school teachers, a total of 16,409 teachers. The total enrolment in white elementary and high schools was 295,896; in Negro elementary and high schools, 291,407.

Public Welfare.—In 1943 approximately 300,000 workers were covered by unemployment insurance. Benefits paid to persons covered by unemployment insurance amounted to $370,366. From July 1, 1942 through June 30, 1943, the state department of public welfare paid $2,818,649 to 29,040 recipients of old age assistance; $169,448 to 1,443 recipients of aid to the blind; $602,469 to 3,261 families for aid to 8,356 dependent children.

The Work Projects administration's total expenditures for the year were approximately $3,068,269, its average employment per month from Jan. 1943 through its liquidation in June 1943 was approximately 4,165.

Agriculture.—In 1943 there were 291,092 farms covering 30,348,800 ac., with a total acreage of 7,018,000 harvested. The total value of agricultural production in 1942 amounted to $334,429,000; in 1943, to $367,403,000.

Cash income from crops in 1942 amounted to $241,658,000; from livestock, to $52,252,000; from government payments, to $28,947,000.

Table I.—*Leading Agricultural Products of Mississippi, 1943 and 1942*

Crop	1943	1942
Cotton, bales	1,840,000	1,968,000
Cottonseed, tons	820,000	878,000
Corn, bu.	43,508,000	49,198,000
Oats, bu.	9,000,000	9,000,000
Hay, tons	1,007,000	1,127,000
Sweet potatoes, bu.	6,970,000	6,460,000
Sugar-cane syrup, gal.	2,992,000	3,300,000
Sorghum syrup, gal.	1,495,000	1,800,000
Peanuts, lb.	23,000,000	25,000,000
Lespedeza seed, lb.	1,900,000	3,300,000
Peaches, bu.	476,000	974,000
Pecans, lb.	5,300,000	5,400,000

Communications.—In 1943 the state maintained 6,443 mi. of highways and the counties approximately 64,000 mi. The total state expenditure for highways in 1943 amounted to $4,305,836.07; in 1942, to $5,552,046.54. The county expenditure for maintenance costs only amounted to $7,380,744.55 in 1943; to $8,069,506.06 in 1942.

The total mileage of railroads in the state on Dec. 31, 1943, was 3,947.33 mi.

Banking and Finance.—On Dec. 31, 1943, there were 179 state banks in Mississippi, with 22 branch banks and 27 branch offices. There were 22 national banks in Mississippi. The resources of the state banks were $364,081,370.42 and deposits were $340,916,295.16; the resources of the national banks were $153,756,194.32 and deposits were $145,031,512.32. The general fund account as of Jan. 1, 1943, amounted to a balance of $11,989,739.17. On Dec. 31, 1943, the balance was $22,967,989.60. The special fund account showed a balance of $5,952,053.94 on Dec. 31, 1943. On Dec. 31, 1943, the general fund debt of the state was $22,606,000 (direct obligation bonds); outstanding highway bonds amounted to $51,097,000, making a total state debt of $73,703,000.

Manufacturing.—The value of manufactures in the state in 1937 was $190,670,510; in 1939 (the last federal biennial census as of 1943), $174,937,294. The number of persons employed in 1937 was 49,246; in 1939, 50,014.

The wages paid in 1937 amounted to $32,091,639; in 1939, $34,083,646.

Mineral Production.—The total value of mineral production in 1942, including natural gas, sand and gravel, crude oil and other mineral products, determined from tax paid, was $29,726,143. In 1942 approximately 28,614,235 bbl. of petroleum were produced; in 1943, 18,853,067 bbl. In 1942 2,084,061,000 cu.ft. natural gas were produced; in 1943, 1,300,000,000 cu.ft. On Dec. 31, 1943, there were approximately 375 producing oil wells in the state. (C. Cs.)

Table II.—*Principal Mineral Products of Mississippi, 1942*

Mineral	Value 1942
Natural gas	$ 210,600
Sand and gravel	3,020,822
Crude oil	26,358,825
Other mineral products	126,896

Missouri. A west north central state of the U.S.A., admitted to the union in 1821; popularly known as the "Show Me" state. Area, 69,674 sq.mi., of which 404 are water. Pop. (1940) 3,784,664 (51.8% urban, 48.2% rural); 3,425,062 (90.5%) native white, 114,125 (3%) foreign-born white, 224,386 (5.9%) Negro. Capital, Jefferson City (24,268). Largest cities: St. Louis (816,048), Kansas City (399,178), St. Joseph (75,711), Springfield (61,238).

History.—The 62nd Missouri general assembly (Jan. 6–Aug. 23, 1943) was in session longer than any previous assembly. The senate was evenly divided politically, with 17 Democrats and 17 Republicans, but its presiding officer, the lieutenant governor, was a Democrat; the house was overwhelmingly Republican (95 to 55). The legislature appropriated more than $255,000,000 for the 1943–44 biennium, the largest sum in Missouri's history. Of this amount, it allotted $52,750,000 for old-age assistance ($11,550,000 above the 1941–42 fund), and $11,450,000 for general relief and dependent children (a $3,550,000 decrease). The legislature enacted laws providing for: a three-day waiting period for the issuance of marriage licences; serological tests for marriage licence applicants; a revision of the civil procedure and corporation codes; a permanent joint committee on legislative research; the establishment of teachers' pension and retirement funds by the three largest cities; a soil conservation commission; a revision of the Missouri food and drug laws; an absentee ballot for members of the armed forces. The legislature defeated the governor's proposals to establish a state merit system and to consolidate the state's tax collection agencies.

The legislature proposed two constitutional amendments: the first, which was subsequently approved by the voters at a special election on April 6, 1943, provided that all laws, except appropriation laws, should become effective 90 days after enactment; the second, to be passed upon by the voters in Nov. 1944, gives the legislature power to direct the investment or disbursal of county school funds for public school purposes.

At the special election on April 6, 1943, the voters chose 83 delegates to a convention to revise the state constitution. This constitutional convention, the sixth in Missouri's history, convened at Jefferson City on Sept. 21, 1943, and was still in session in Jan. 1944.

The major state officers (1943), all Democrats except the Republican governor, were: Forrest C. Donnell, governor; Frank G. Harris, lieutenant governor; Dwight H. Brown, secretary of state; Forrest Smith, auditor; Wilson Bell, treasurer; Roy S. McKittrick, attorney general.

Education.—For the school year ending June 30, 1943, the public school system consisted of 7,740 elementary schools, with 508,529 pupils and 17,358 teachers; 867 secondary schools, with 159,549 pupils and 7,867 teachers; 2 state universities (white and Negro); 5 state teachers' colleges; schools for the deaf and blind; and a Negro vocational school.

Public Welfare, Charities, Correction.—For the year ending June 30, 1943, unemployment compensation totalled $4,695,772, and the government employment services made 456,339 placements. For the same period WPA earnings amounted to $7,615,993; old-age assistance $23,890,282; aid to dependent children $4,938,410; general relief $2,176,355; blind pensions $979,157. In June 1943, 108,708 persons received old-age assistance; 29,084 aid to dependent children; 15,488 general relief; 3,032 blind pensions. On Dec. 31, 1942, the state penitentiary had 3,067 inmates, and the four state correctional institutions a total of 1,044 inmates.

Communication.—On Dec. 31, 1942, Missouri had 16,116 mi. of state highways and 100,671 mi. of rural roads. During 1942 the state highway department spent $23,824,532 (state and fed-

eral funds), of which $8,371,345 was for construction, and $4,268,166 for maintenance. In 1941 railroad mileage totalled 7,042 mi.

Banking and Finance.—On June 30, 1943, Missouri had 483 state banks, with deposits of $1,162,702,000 and resources (loans and investments) of $1,080,237,000; 83 national banks, with deposits of $799,852,000 and resources (loans and investments) of $863,260,000; 206 building and loan associations, with resources of $140,236,922.

Total receipts of the state treasury during 1943 amounted to $113,795,420; disbursements for 1943, $99,680,502; gross state debt, Jan. 1, 1943, $83,008,000; net state debt, Dec. 31, 1943, $76,255,000.

Agriculture.—The value of Missouri's 1943 crops, harvested from 12,994,200 ac., was estimated at $362,326,000, an increase of 17% over the value of 1942. Production of most crops in 1943 was below 1942, but was above any other recent year; the acreage harvested was 5% above 1942. Floods destroyed 700,000 ac. of Missouri's crops in May and June, when the Mississippi river at St. Louis reached its highest mark (38.94 ft.) since 1844.

Table I.—*Leading Agricultural Products of Missouri, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	139,810,000	140,899,000
Tame hay, tons	3,575,000	4,368,000
Cotton, bales	295,000	417,000
Oats, bu.	51,750,000	50,427,000
Winter wheat, bu.	12,649,000	9,035,000
Soybeans (for beans), bu.	8,696,000	7,065,000

Manufacturing.—During 1939, Missouri's industries manufactured products valued at $1,388,056,267, employed 178,538 wage earners and 24,275 salaried persons, and paid $190,735,851 in wages and $58,937,137 in salaries.

Table II.—*Principal Industries of Missouri, 1939 and 1937*

Industry	Value, 1939	Value, 1937
Meat packing (wholesale)	$107,254,213	$116,576,053
Footwear (except rubber)	100,346,106	103,253,379
Iron and steel (excluding machinery)	89,050,177	77,681,234
Wearing apparel	85,297,177	76,998,667
Malt liquors	41,412,301	34,272,016
Drugs, medicines	23,006,499	24,335,460

Mineral Production.—The value of Missouri's mineral production in 1940 was estimated at $50,325,000, 10.3% more than in 1939. In 1941 Missouri produced 165,900 tons of lead (36% of the U.S. output), and 6,328,000 bbl. Portland cement, 27.3% more than in 1940.

Table III.—*Principal Mineral Products of Missouri, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Lead	$17,205,400	$14,600,414
Cement	Fig. not available	7,420,013
Bituminous coal	Fig. not available	6,124,000
Stone	6,176,867	4,589,986
Clay (raw and products)	Fig. not available	3,931,065
Lime	3,184,293	2,800,379
Barite	1,216,069	1,163,870

(R. P. Br.)

Mohammedanism: *see* Islam.

Molotov, Vyacheslav Mikhailovich (1890 -), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd soviet executive committee. In 1920 he was appointed secretary of the central committee of the communist party of the Ukraine, and in the following year he held this office for the whole of the U.S.S.R. He was appointed president of the soviet of people's commissars in 1930 and was named foreign commissar May 3, 1939, to succeed Maxim Litvinov. The latter appointment foreshadowed the temporary shift in soviet foreign policy which led to the nazi-soviet pact of nonaggression, signed by Molotov in Moscow, Aug. 24, 1939.

On May 6, 1941, Molotov resigned as premier of the U.S.S.R. and was succeeded in this office by Stalin; he remained as foreign commissar, however, and took over the vice-premiership. On July 1, ten days after the German invasion started, Stalin named him vice-chairman of the soviet defense committee, to which was delegated the full authority of state. On July 13, Molotov signed the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. In the spring of 1942, Molotov went to England and on May 26 he and Anthony Eden signed a 20-year Russo-British mutual assistance pact. Molotov then flew to Washington, where, after conferences from May 29 to June 4, he and President Roosevelt signed a lend-lease agreement. In August, Molotov was named vice-chairman of the people's council of commissars.

On April 26, 1943, Molotov announced the suspension of relations with Poland. In reply to charges of mass murders of Polish officers, he accused the Poles of collaboration with Germany in an effort to force territorial concessions from the U.S.S.R. Later in the year, Oct. 19–30, he presided at a tripartite conference with Anthony Eden and Cordell Hull in Moscow. On Dec. 12, Molotov signed a mutual assistance pact with Czechoslovakia.

Moltke, Hans Adolf von (1884–1943), German diplomat, was born Nov. 29 of a distinguished Junkers family. His father, Friedrich von Moltke, was a state minister of Prussia; his great uncle was Count Helmuth von Moltke, Prussian field marshal who led Bismarck's armies against France in 1870. Hans von Moltke was educated at the universities of Berlin, Heidelberg and Königsberg. He entered the diplomatic service in 1913, joined the German army at the outbreak of World War I and re-entered the diplomatic corps at the war's end, as embassy counsellor at Constantinople (now Istanbul). He was attached to the foreign office, 1928–31, and was appointed minister to Poland, 1931. After Poland signed its non-aggression pact with Germany in 1934, Hitler raised the status of his legation in Warsaw to an embassy and Von Moltke became Reich ambassador. Von Moltke was recalled after the German invasion of Poland in 1939; he was credited with having compiled German "documents" putting the war guilt on the Allies. He was sent to Madrid as ambassador in Jan. 1943. It was reported that Hitler had instructed him to use every power at his means to alienate Gen. Franco from the Allies and to try to lure the Spanish dictator into the axis camp. Von Moltke's efforts in this direction never bore fruit. He died in Madrid, March 22.

Molybdenum. Although molybdenum started 1943 in the list of materials short in supply, this shortage was remedied. Consumption demands were not only met, but a stockpile was accumulated covering a six months' supply. During the first six months of 1943 the new supply included about 29,000,000 lb. of domestic output and 2,200,000 lb. of imports, a total of 31,200,000 lb., double the world output of as late as 1937. Consumption for 1943 was estimated at 52,400,000 lb., 10% less than the production rate for the year. Requirements for 1944 were estimated at 44,551,000 lb., including a continuation of 1943 fourth-quarter rate of exports. Lend-lease and Canadian requirements totaled 7,917,000 lb. in the first half of 1943.

An official announcement stated that Canada was in 1943 pro-

ducing a substantial portion of her requirements, with three mines producing. (G. A. Ro.)

Monaco. A principality on the Mediterranean coast, bounded on the land side by French (occupied) territory. Area 375 ac. (0.59 sq.mi.); pop. (census 1939), 23,973. Chief towns: Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II; language: French. The chief occupation is catering for visitors, who, before war broke out in 1939, numbered more than 2,000,000 annually.

Monazite. No information was available on production or imports of monazite in the United States, but at the end of 1943 cerium salts were listed as balanced as to supply and essential demand. The working of beach sands in Florida for titanium and zirconium give a small byproduct recovery of monazite. Normally India and Brazil are the chief sources of supply. (G. A. Ro.)

Monetary Units: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Mongolia (INNER AND OUTER). A vast, arid, sparsely populated tableland in northeastern Asia, with several deserts, of which the Gobi is the largest. Estimated area 956,844 sq.mi. It is bounded N. by Siberia, E. by Manchuria ("Manchoukuo"), W. by Sin Kiang (Chinese Turkestan), S. by China. Mongolia was included in the boundaries of the Chinese Empire and the Chinese Republic never renounced its claim to sovereignty in this area. But in practice Outer Mongolia was controlled by the soviet union after 1921 and Japan dominated Inner Mongolia after 1937. Of these two divisions, Outer Mongolia is the larger in size (622,744 sq.mi.), but Inner Mongolia (334,100 sq.mi.) is more closely settled, with some industry, agriculture and mining along with the vast stretches of grazing land which are the basis of the typical pastoral economy of the nomadic Mongols.

Outer Mongolia.—Population (est. 1941) 850,000. Capital Ulan Bator, formerly Urga (pop. 100,000). This immense territory after World War I was almost completely isolated from the outside world, except for the soviet union. Soviet troops, pursuing the anti-Bolshevik forces of Baron Ungern-Sternberg, which had utilized Outer Mongolia as a base for raids into Siberia, entered Outer Mongolia in 1921 and co-operated with a few educated Mongol revolutionaries in setting up a people's revolutionary government. From that time Outer Mongolia was closely controlled from Moscow. When diplomatic relations were resumed between the soviet and Chinese governments in 1924 the soviet government recognized Outer Mongolia as an integral part of China and promised to withdraw its troops from that region. In practice, however, China was unable to exercise administrative sovereignty. A treaty of alliance was concluded between the soviet union and Outer Mongolia in 1936 and there was apparently close military co-operation between the two regimes in border clashes with Japanese and Manchurian troops during the '30s. The most serious of these was at Nomonhan in 1939. The Soviet-Japanese treaty of neutrality of April 1941 contained a clause under which Japan promised to respect the territorial inviolability of Outer Mongolia, the soviet union undertaking a similar obligation in relation to Manchuria; and there were no reports of border troubles during 1943.

Under a constitution which was promulgated in 1924 and which closely followed the general outline of the soviet constitution, although with some allowances for the primitive character of Mongolian economy and ways of life, Outer Mongolia constitutes a people's republic, with power vested in a representative assembly called the Great Huruldan, which selects from its members a smaller group, the Little Huruldan, for more frequent sessions. The Little Huruldan elects a committee of five, which is in charge of current affairs.

Economic Developments.—Outer Mongolia's trade connections continued to be exclusively with the soviet union in 1943. Russian financial advisers helped work out a new currency system, the basic unit being the *tugerik*, valued at 90 kopecks. Most of the wealth of Outer Mongolia consists of herds and flocks. It is estimated that there were 1,340,000 horses, 270,000 camels, 1,500,000 oxen and 10,600,000 sheep in the country in 1942. There were some disturbances and uprisings in the country between 1929 and 1932 because severe measures were employed to promote collectivist ownership of cattle. Some of the wealthier Mongols fled across the frontier into China. These measures were subsequently modified.

Wool, hides, bristles and casings are leading Outer Mongolian exports. The soviet union supplies the country with oil, chemicals, cement, textiles and manufactured goods. Trade is financed through the Mongol Bank, in which the soviet government owns half the capital. The chief commercial organization is the Mongolian Central Co-operative society. There is an air line between Ulan Bator and Verkhne-Udinsk in Siberia, and there is a highway between Ulan Bator and the Siberian border town of Kyakhta.

There are no railways in the country. Northwest of Outer Mongolia is the little soviet protectorate of Tannu-Tuva, area 64,000 sq.mi., pop. 65,000, capital Kysylchoto, with communication with Siberia by way of the Yenisei river, which rises in Outer Mongolia.

Inner Mongolia.—Inner Mongolia includes the three northern Chinese provinces of Chahar, Suiyuan and Ningsia (Sitao). The Japanese invasion of North China in 1937 led to the creation, under strong Japanese tutelage, of a new state called Mengchiang (Federated Council of the Mongol Borderland), claiming authority over the three provinces, with their mixed Chinese and Mongol population of five to seven million.

Because of the differing racial composition and economic character of the region, the new state was organized in the form of a federation of three regimes, with capitals at Hohohoto (formerly Suiyuan), Kalgan and Tatung. The regime at Hohohoto was composed of representatives of the Mongol "banners," or clans and represented the fruition of a long period of Japanese intrigue among the Mongol chiefs of North China, designed to take advantage of the political and economic friction between the agricultural Chinese and the nomadic Mongols, who sometimes resented the encroachment of Chinese settlers on their grazing lands.

Tatung is the principal town of North Shansi and the centre of a huge but very imperfectly developed coal region. Kalgan is an old trading town northwest of Peking.

The Japanese authorities hoped to insure a regular supply of wool from this region after it had been brought under their political control; but economic development was hampered by guerrilla warfare and by floods and drought. The Meng-chiang yuan is of the same nominal value as the Japanese yen (23.48 U.S. cents) and Meng-chiang trade is channelled entirely through Japanese sources. The Peking-Suiyuan railway affords the principal means of communication for Inner Mongolia and is carefully guarded by Japanese troops. Japanese peace offers to China always specified Inner Mongolia as a region where Japan should possess special political and economic rights. The principal products of Inner Mongolia are wool, furs, coal, iron, opium, cereal and linseed. (W. H. Ch.)

Montana. A northwestern state of the United States, popularly known as the "Treasure state." Area, 147,138 sq.mi.; pop. (1940): 559,456. The urban population was 211,535 or 37.8%. Capital, Helena (15,056). Other cities of 10,000 or more were: Butte (37,081); Great Falls (29,928); Billings (23,261); Missoula (18,449); Anaconda (11,004). Of the total population there were 540,468 whites, of whom 484,826 were native-born and 55,642 were foreign-born. The Indian population numbered 16,841.

History.—In the general election of 1942 the Republicans had gained control of both houses of the state legislature. Sam G. Ford, elected for a four-year term in 1940, was the first Republican governor since 1920. Other state officials in 1943 were Ernest T. Eaton, lieutenant governor; Sam Mitchell, secretary of state; John J. Holmes, auditor; R. V. Bottomly, attorney general; Elizabeth Ireland, superintendent of public instruction.

A $70,000,000 postwar public works program to aid private industry in providing jobs for returning veterans and give the state needed improvements, was drafted by the Montana planning board in 1943. Highway construction, irrigation of semi-arid farm lands, extension of rural electrification, and new buildings and improvements at the state institutions were listed as the main projects to be undertaken. Strenuous opposition developed throughout the state against the army engineers' plan to raise the level of Flathead lake 17 ft. or more, the chief objection being the claim that the economic and social life of some 50,000 Montana people would be disrupted. State agencies, however, co-operated with the federal government in developing plans for two large water conservation projects—the Hungry Horse dam on the South Fork of the Flathead river, and the Canyon Ferry dam on the Missouri river near Helena.

Education.—There were 1,786 elementary schools in Montana in 1943, with an enrolment of 69,236 and a teaching staff of 3,514. There were 195 high schools with an enrolment of 27,329 and 1,425 teachers. The cost of operating these schools was $12,895,233.

Public Welfare, Charities, Correction.—Through federal and state aid, approximately 21,000 persons received public assistance in 1943. Grants totalling $4,965,538 were distributed as follows (figures in parentheses indicate the average number of recipients per month): Old age assistance (11,845), $3,590,702; aid to dependent children (6,322), $703,640; aid to needy blind (313), $101,196; general relief (1,436), $320,000; medical care (331), $40,000; hospitalization (285), $175,000; burials (45), $35,000. Unemployment compensation benefits of $109,239—less than one tenth the amount for 1942—were paid to 1,194 persons, an average of $11.68 per week for 7.83 weeks, or $91.49 per claimant. Correctional institutions with their average population and total expenditures in 1943 were: Montana State prison, 403 inmates, $181,383; State Industrial school, 95 inmates, $70,930; Vocational School for Girls, 79 inmates, $43,025.

Communication.—Approval during 1943 of the Federal Aid Secondary system added nearly 1,400 mi. to the state highway system, bringing the total mileage under the state highway commission up to 7,951. State highway expenditures in 1943 were $4,490,930. There were 13 designated airports and 63 emergency landing fields, including those used by the forest service. The number of telephones was estimated at 77,500.

Banking and Finance.—There were 110 banks in the state in 1943. The 41 national banks had total deposits of $165,670,000, and their total resources were $175,554,000. State banks had total assets of $126,254,254 and their total deposits were $117,836,620. There were 16 building and loan associations with assets of $12,981,350. For the fiscal year 1942–43, the net state income was $41,203,692 and the total expenditures were $33,856,801. The gross debt of the state was $8,421,725 and the net debt, $6,942,657.

Agriculture.—Crop production in Montana in 1943 was 4% higher than in 1942 and the greatest in the state's history. The value of all main crops was $184,292,000 as compared with $139,869,000 in 1942—a 32% valuation increase due mainly to price increases. The cash income from livestock and livestock products was $125,829,000. Government payments were $12,500,000.

Table I.—*Leading Agricultural Products of Montana, 1943 and 1942*

Crop	1943	1942
Wheat, bu.	74,335,000	73,783,000
Hay, tons	2,499,000	2,750,000
Barley, bu.	15,939,000	12,330,000
Flaxseed, bu.	4,544,000	2,475,000
Oats, bu.	18,760,000	20,319,000
Sugar beets, tons	581,000	915,000
Corn, bu.	3,230,000	3,800,000
Potatoes, bu.	2,645,000	1,725,000
Seed peas, 100-lb. bags	627,000	492,000
Dry beans, 100-lb. bags	549,000	338,000
Alfalfa seed, bu.	97,000	90,000
Mustard seed, lb.	31,300,000	34,000,000

Manufacturing.—The total value of products manufactured in Montana in 1939 was $151,885,026 as compared with $176,278,814 in 1937. Persons employed in manufacturing numbered 10,898 in 1939 and were paid salaries and wages amounting to $15,832,241. Information through the U.S. biennial census for manufactures was not available in 1943 for the years since 1939.

Mineral Production.—The 1943 production of gold, silver, copper, lead and zinc in Montana was valued at $53,671,500, a decrease of 11% under that of 1942. There was a decrease in the output of each metal, but the value of the copper output was greater, owing to the average higher price of the metal.

Table II.—*Principal Mineral Products of Montana, 1943 and 1942*

Mineral	Value, 1943	Value, 1942
Copper	$34,775,000	$34,168,948
Zinc	8,316,800	10,176,900
Silver	6,144,000	7,955,995
Lead	2,353,200	2,686,700
Gold	2,082,500	5,141,220
Total	$53,671,500	$60,129,853

Crude oil production amounted to approximately 8,000,000 bbl. in 1943 as compared with the all-time state record of 8,093,972 bbl. produced in Montana in 1942. (E. E. B.)

Montenegro. A former kingdom in the northwest Balkan peninsula, Montenegro had voted its union with Serbia Nov. 25, 1918, in the then newly formed kingdom of the Serbs, Croats and Slovenes, later Yugoslavia. As a province within Yugoslavia, Montenegro had an area of 3,733 sq.mi. With the redistribution of Yugoslav administration in 1930, Cetinje, which had a population of 6,367 on March 31, 1931, became the capital of the Zetska banovina or province.

When Yugoslavia disintegrated as the result of German aggression in April 1941, the country was occupied by Italians. This occupation came to an end with the collapse of Italian fascism in July 1943, and the subsequent Italian surrender to the Allies. Throughout the two years of Italian occupation the inhabitants of Montenegro and its mountain fastnesses, a proud and freedom-loving people who had resisted for centuries the pressure of Turkey and kept their independence, refused to submit to the "new order" imposed by the axis. Though very little authentic news came from Montenegro in 1943, there is no doubt that after the downfall of Italy the patriot forces, both those of General Draja Mikhailovitch and those of General Tito (Josip Brozovitch) continued to harass the German garrisons which replaced the Italians and to occupy very large parts of Montenegrin

territory. (*See* also CROATIA; DALMATIA; YUGOSLAVIA.) (H. Ko.)

Montgomery, Bernard Law (1887–), British army officer, was born Nov. 16. The son of an Ulster clergyman, he joined the Royal Warwickshire regiment as a second lieutenant in 1908. He fought in France during World War I, was wounded twice and received the distinguished service order. After the war, he was a battalion commander, served in Palestine as division commander and was instructor at the Staff college in Quetta, India, remaining until 1937. A month before the outbreak of World War II, in Aug. 1939, he was appointed to command the third division which went to France with the B.E.F., and helped evacuate his troops from Dunkirk in June 1940. In 1942, when Rommel had driven the British constantly eastward in North Africa until the whole middle east was threatened, Churchill announced on Aug. 18 the appointment of Lt. Gen. Montgomery as commander of the British 8th army. Under his leadership, the 8th army stopped and turned the Afrika Korps at El Alamein. Three months later, Jan. 23, 1943, Montgomery captured Tripoli, 1,200 mi. to the west. On Feb. 11, Montgomery and his then renowned 8th army were placed under Gen. Dwight Eisenhower's unified command. Montgomery broke the Mareth line on March 29, and took part in the capture of Tunis and Bizerte early in May. The 8th army continued its drive across the Mediterranean into Sicily and Italy, and when the year ended was driving up the eastern Italian coast toward Rome. On Dec. 24, coincident with Roosevelt's announcement of Eisenhower as invasion commander, London announced that Montgomery would return to London to serve under him as commander of British ground forces.

Montreal. A city in the province of Quebec, Canada, first called Ville Marie, founded in 1642 on the site of the Indian village of Hochelaga, is situated on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. Being at the head of ocean navigation, it is the terminus for lake vessels from the Great Lakes and is served by three canal systems—the St. Lawrence canals (1,230 mi. to the Great Lakes), the eastern United States canals, via the Richelieu river and Lake Champlain (127 mi.) and the Ottawa river canals (119 mi.).

The population of the city proper, according to the census of 1941, was 903,007, and of greater Montreal 1,105,359. At the beginning of 1944, as estimated by *Lovell's Directory,* it was, for the city proper, 1,326,305, and for greater Montreal 1,522,757.

Default in the payment of the principal of certain of the city's bonds caused the Quebec municipal commission, a provincial organization, to be placed in charge of certain parts of the city administration. Interest on all bonds has been paid regularly and a plan for refunding is under consideration.

In Dec. 1943, the police and firemen went on strike, in protest against the city's refusal to give effect to the majority award of a board of arbitration. The strike lasted only a few hours. The clerical staff later went on strike, this strike lasting about 23 days.

The port of Montreal is the largest in Canada. War conditions accelerated its activity in 1939–43, but statistics are unavailable because of war censorship.

In 1943 building permits were issued for 1,102 new projects, having a value of $6,186,804, and for 1,861 repair jobs, having a value of $3,109,544. Bank deposits (for 11 months ended Nov. 30, 1943) were $12,548,546,772 and bank clearings (for 9 months ended Sept. 30, 1943) were $5,848,975,421. The assessed value of real estate as of April 30, 1943, was $1,250,128,640, of which $337,204,619 was exempt from taxation. (J. A. Ma.)

Mordacq, Jean-Jules-Henri (1868–1943), French army officer and biographer of Georges Clemenceau, was born Jan. 12 in Clermont-Ferrand. Educated at St. Cyr Military academy, General Mordacq came to play an important role in World War I. He was chief of Premier Clemenceau's military aides and his principal assistant from 1916 to 1918. When an armistice was imminent, he consistently held, despite popular disapproval, that the Allies continue the war until Germany surrendered unconditionally. After the war, he commanded an army of occupation in the Ruhr. When Clemenceau retired, General Mordacq, who had incurred many political enemies, passed into oblivion. He committed suicide by drowning in the Seine river in Paris, April 12, according to a Paris broadcast.

Morgan, John Pierpont (1867–1943), U.S. financier and banker, was born Sept. 7 at Irvington, N.Y. (For his early career see *Encyclopædia Britannica.*) Morgan shunned publicity, but his appearance before the Pecora banking committee in 1933 was turned into a public spectacle. The hectic sessions, likened to a circus sideshow, made photographic history when a press agent planted a midget on Morgan's lap while photographers snapped pictures. When the Banking Act of 1933 was passed, the Morgan firm dropped its security underwriting and continued with its private deposit banking. The investment business was turned over to a new firm headed by Mr. Morgan's son, Henry, and two partners. Further changes were made in 1940. The Morgan partnership was dissolved and the "House of Morgan" was recreated as an incorporated bank with Morgan as chairman of the board.

Morgan died of a heart ailment while vacationing in Boca Grande, Fla., March 13.

Mormons. During the year the temple in Idaho Falls, Ida., was completed and was ready for dedication, planned for the spring or early summer of 1944.

Welfare.—The Church Welfare program steadily developed over the church. There were 14,578 ac. of land farmed during the year by voluntary, gratuitous labour to produce food for the needy. Some 65 canneries were operated, and 598 livestock "projects." People were urged to can and otherwise preserve as much food as possible. The people responded by working in groups; housewives worked at home. These groups processed 1,253,000 cans. Strictly welfare canning amounted to 849,000 cans, a total of 2,102,000 cans. Careful estimates indicated that families canned and stored an additional 42,625,000 cans, a total for the church of 44,727,000 cans in the wards and stakes. Adding to this the canning by families in the missions, the total would approximate 50,000,000 cans, which represented more than 1,000,000,000 points, a material assistance to the food problem in affected areas.

Buildings.—The church building program was seriously curtailed owing to the difficulty of getting building materials. Normally the church builds an average of 100 churches per year, at an approximate prewar cost of $2,000,000. New building almost ceased because of operation of priorities.

Priesthood Work.—Intensive efforts were carried forward for upbuilding priesthood organization work, particularly in developing an increased brotherhood among the members. The different

priesthood organizations were urged to institute "projects" for the care of their own needy members, which resulted in 213 crop "projects," 157 livestock "projects," and 30 manufacturing and processing "projects" (total 400), for aiding needy members of the priesthood of the church, which includes all male members of the church over 12 years of age. (*See* also CHURCH MEMBERSHIP.) (J. R. CL.)

Morrison, Herbert Stanley (1888–), British statesman, was born at Brixton, London, Jan. 3, 1888. Having left elementary school at 14, he passed through a variety of jobs. From 1913 onwards he took up politics as a full-time occupation, first as a journalist, later as secretary to the London Labour party. After a year as mayor of Hackney (1919–20) he was elected, in 1922, to the London county council which remained the main sphere of his activities and influence for the next 18 years. After a brief spell in parliament (1923–24) Morrison was re-elected in 1929 and joined the second Labour government as minister of transport. Out of parliament from 1931 until 1935, he was again elected in 1935. As leader of the L.C.C. he was responsible for the smooth working of the evacuation of London school children upon the outbreak of war. In May 1940 he became, as minister of supply, one of the three Labour members of the Churchill coalition government. In October he was put in charge of the home office and ministry of home security, offices which he still held in 1943, since 1941 as a member of the war cabinet. At the Labour party conference of 1943 he was defeated in the election for treasurer, but by a series of vigorous and widely discussed speeches on postwar problems he staked a solid claim to the party leadership at the end of the war. Moscow. When the history of Moscow in wartime comes to be written, one outstanding feature will be recorded, that of the close collaboration of the mass of the population with the authorities in overcoming the difficulties consequent on siege. The story of the 80,000 Muscovites, many of them women, who in the autumn of 1942 went to the forests with the aim of securing the city's fuel supply, is only one of the many examples of this spirit of collaboration. Hundreds of thousands of people became allotment-holders, mutually helping in the cultivation of allotments. The Trade Union committee frequently arranged with suburban vegetable farms for supplies of farm products to be sent to factories or office canteens. During the winter of 1942–43, with the help of the government, over 2,000 well-equipped rooms or flats in Moscow had been given to families of front line fighters, over 200 new kindergartens and 100 crèches had been opened. In special dining halls for weaker children, over 20,000 children of men at the front were regularly fed.

With the help of the active participation of the population was "ensured smooth distribution of food supplies and queuing is very little in evidence."

For rationing purposes people fell into three categories. The first and by far the largest category consisted of the industrial workers. They received more bread, butter and meat than either office employees or adult dependents not engaged in industry. Scientists and artists were also placed in the category for workers. The bread ration for the man and woman working in an office was about 1¼ lb. per day, while that of the factory worker was 1½–1¾ lb. per day. The Moscow ration of cereals for men or women in industry was double that of the office employees, the same applied to butter and other fats. Most of the factory and office employees dined at factory or office canteens or at hotel restaurants or cafés allocated to them. No coupons were surrendered for potatoes and vegetables at dinner and often not even for meat, so that dinner for workers and employees could in the main be regarded as additional food to the ration.

The population of Moscow could also supplement their ration by purchasing food on collective farm markets, "but while prewar prices prevail for rationed food, prices in the kolkhoz markets are comparatively high. On the whole, our meals are frugal but they do contain the necessary vitamins and calories that enable us to keep on working hard—hard enough to keep the Red Army well supplied" (Soviet *Monitor*).

This concentration of all efforts of the Moscow population to assure the smooth flow of supplies to the Red army and to "increase and educate well-trained reserves for the Red Army" was the main motive in the life of the Moscow population in 1943. (A. M. Bv.)

Moscow, Pact of: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Motion Pictures. The motion picture industry in the U.S. turned in a record-breaking performance in 1943. Despite shortages of man power and essentials, the industry was in a more flourishing condition at the year's end than at any previous period.

Gross earnings of producing companies were at an all-time high. RKO, for example, which showed a deficit in 1942, changed this into a surprisingly high profit in 1943. Theatre receipts reached unprecedented levels, with a trend toward substantially increased admission prices. On the other side of the ledger were heavy taxes, increased pay rolls for rank-and-file workers and mounting costs for materials going into picture-making.

Production expenses soared above anything the industry had ever known. Increases naturally varied with the circumstances of the individual pictures, with estimates ranging from 25% to 100%. In December, William F. Rodgers, Metro-Goldwyn-Mayer's general sales manager, addressing a meeting of exhibitors, was quoted as saying that his company's production costs were twice those of a year ago; that pictures which under ordinary circumstances would have taken 7 or 8 weeks to produce now required 14 or 15 weeks.

Financial authorities, viewing the general motion picture scene, inclined to the view that receipts would continue to take up the slack of mounting taxes and costs and that, insofar as prophecy was possible, optimistic prospects extended into the postwar era.

The industry kept a wary eye on television, in which some studios already had interested themselves financially. Also, the view was widely held that if Hollywood, after the war, was to continue to dominate the cinemas of the world, Hollywood would have to fight to do it. It was felt that, aside from the economic aspect, motion pictures had shown themselves to be so important in the fields of propaganda and morale that all governments in a position to do so would encourage to the limit their countries' picture production and distribution.

The capital investment of the motion picture industry in 1943 was practically unchanged from that of 1942, war conditions having prevented any appreciable constructive progress.

Theatres	$1,900,000,000
Studios	125,000,000
Distribution	25,000,000
	$2,050,000,000

Reliable statistics were lacking at 1943's end. One financial authority estimated that amusement industry earnings in 1943 showed the greatest increase in the nation—60.9%. Estimates based on government admission taxes for October indicated a daily film box-office take of $5,000,000.

The industry was in an unusually fluid state in 1943. Changing conditions made rigid planning impossible. Studios generally made it plain that production forecasts were just that—that the number and kind of pictures would be subject to revision as circumstances warranted.

Backlogs of completed but unreleased product reached a new high. The trend was toward fewer releases, since pictures were held longer in theatres and fewer prints for distribution were made, because of the governmental raw film stock allocations. As a result, there was some complaint of product shortage by smaller and subsequent-run houses. Their problem was met in part by re-issues of old pictures. Illustrative of increased playing time: New York city's Radio City Music Hall, the world's largest theatre, screened only 12 pictures in 1943, including one which had started its run in 1942. In 1933, its first year of operation, 46 pictures were shown; 26 in 1941.

As was natural in a boom period, 1943 saw an unusual increase in the number of independent producing companies. The Production Code administration approved 403 feature pictures, of which 18 were foreign, through Dec. 18, 1943. Indicative of the decline in feature production, 322 were approved during the first ten months of 1943, as compared with 450 for the corresponding period in 1942.

In 1943 more and more world-famous names blinked out on the marquees, as additional male stars went into the service. Studios indulged in unusual co-operation to cope with the actor shortage, with loan-outs of stars and featured players increasing. More and more the play became the thing. Story prices went up as the stars departed. Best-sellers and stage hits were purchased at skyrocket heights.

Increase in production value was sought through the use of colour, which had its biggest year. It was expected that colour would be utilized even more after the war.

Indicative of the casting situation was the conclusion to be drawn from a study of *Motion Picture Herald's* ten top money-making stars of 1942. Eight places were won by men (Abbott and Costello were dualled in the poll) and of these war service drew two from before the cameras—Clark Gable, second, and Gene Autry, seventh; in other words, 25% of the top-draw male stars. In the ranks of the younger actors, departures naturally were more numerous. (Actors in service at the end of 1943 were estimated at 1,400.)

The *Motion Picture Herald's* poll for 1943 found a woman at the top—Betty Grable, whose vehicles were Twentieth Century-Fox Technicolor musical comedies. She was followed by Bob Hope, Abbott and Costello (the 1942 champions), Bing Crosby, Gary Cooper, Greer Garson, Humphrey Bogart, James Cagney, Mickey Rooney and Gable, who had a picture released before going into the army. As to types of pictures, there were no pronounced trends discernible during 1943. Musicals, as a leading form of "escapist" fare, were very popular, but a survey showed that public favour was not confined to any particular variety of film.

The industry was continually stirred by protests that it was turning out too many war pictures. But here again the old rule held good. Some war pictures were stand-out hits, others flopped ingloriously.

So, too, with the old problem of low-budgeted pictures. The trend away from "B" films continued. Yet—to confound the analysts—*Hitler's Children*, produced by RKO at a cost of $187,000, and a war picture to boot, was one of 1943's sensational box-office successes.

The most discussed pictures of the year were Paramount's *For Whom the Bell Tolls*, Warner Bros'. *This Is the Army*, Twentieth Century-Fox's *The Song of Bernadette*, Metro-Goldwyn-Mayer's *Madame Curie* and Walt Disney's United Artists release, *Victory Through Air Power*.

The last-named, a picturization of the book of the same name by Alexander P. de Seversky, again revealed Disney as a trail-breaker in the realm of films. His production might best be described as a "motion picture lecture" on the controversial subject of the aeroplane's role in war.

The Movies and the War.—American motion pictures in 1943 performed great services for the government, receiving in return little save the greatest benefit of all—comparative freedom of action. The industry had feared attempts at propaganda control and had maintained vigilance. In 1943 it breathed more easily. It was felt that the government generally was confining its attempts at regulation to the necessities dictated by war.

It was estimated at the end of 1943 that of the 18,000 males normally employed in the actual production of motion pictures, nearly 7,000 were in the armed forces.

Always, beneath the glamour and glitter that the world associates with motion pictures, is solid, skilled, ingenious craftsmanship. It was this characteristic which, in 1943, enabled the industry to turn out a splendid assortment of product despite the disabilities imposed by war conditions. Much of the credit for this belongs to the technical workers. In fact, Hollywood was saying proudly that there was no task beyond the abilities of its technical corps. And therefore Hollywood's contribution to the war effort was especially important. The qualities which make film technicians invaluable to picture-making are among the qualities which are invaluable to war-making.

So the film capital could contribute in quantity specialists whose services were sorely needed—cameramen, still photographers, camouflage experts, sound department technicians specializing in radio work and aeroplane detection, laboratory technicians, precision machinists, electrical experts and many others.

It is possible to touch only briefly on industry war service such as documentary films and government trailers, inter-American relations films, training of technicians, support of war loan and relief drives, entertainment of servicemen by star appearances at camps and overseas.

War training films were turned out by the studios at cost. Prints of 16-mm. films were given for free exhibition to the armed forces abroad. It was estimated at the end of 1943 that such prints supplied to the war department would total 10,200 features and 11,890 short subjects. Reconditioned 16-mm. projectors also were supplied.

Entertainment for Service Men.—Entertainment abroad deserves more than passing notice, however. Stars of both sexes found themselves in regions more strange than any in which they had play-acted on motion picture sets. They faced dangers by land and sea and air. They visited England, Africa, the South Pacific, the Caribbean, Alaska, Newfoundland, India, China. Those who gave of their time and money and comfort and safety are too numerous to name. But in a record of outstanding service, Joe E. Brown's name is outstanding. Other especially noteworthy entertainment names were those of Bob Hope, Jack Benny, Al Jolson, Martha Raye, Carole Landis, Mitzi Mayfair, Kay Francis and Gary Cooper.

A graphic description of the part played by motion pictures in war was given by the special service division, Overseas Motion Picture service, United States army, in a release dated Nov. 16, 1943. This stated that "Hollywood's latest movies are now being

seen by an average of 630,000 overseas men in uniform each night. . . . On one night selected as representative, that of Oct. 1, a total of 1,269 movie shows were presented in army camps around the globe. Attendances ranged from 15,000 in an open-air New Guinea amphitheatre to 11 men in a lonely Quonset hut in an Alaskan outpost."

Awards.—Academy of Motion Picture Arts and Sciences Awards for 1942 (for the principal 1943 awards see p. 457):

Irving G. Thalberg award, for most consistent high quality production achievement by an individual producer, Sidney Franklin; outstanding picture, *Mrs. Miniver*, Metro-Goldwyn-Mayer; performances—actor, James Cagney in *Yankee Doodle Dandy*, Warner Bros.; actress, Greer Garson in *Mrs. Miniver;* supporting actor, Van Heflin in *Johnny Eager*, Metro-Goldwyn-Mayer; supporting actress, Teresa Wright in *Mrs. Miniver;* best direction, William Wyler for *Mrs. Miniver;* best original motion picture story, Emeric Pressburger for *The Invaders* (British), Ortus, Columbia; best (adaptation) screen play, Arthur Wimperis, George Froeschel, James Hilton and Claudine West for *Mrs. Miniver;* best original screen play, Ring Lardner, Jr. and Michael Kanin for *Woman of the Year*, Metro-Goldwyn-Mayer; best art direction—black and white, Richard Day and Joseph Wright for *This Above All*, Twentieth Century-Fox; colour, Richard Day and Joseph Wright for *My Gal Sal*, Twentieth Century-Fox; best cinematography—black and white, Joseph Ruttenberg for *Mrs. Miniver;* colour, Leon Shamroy for *The Black Swan*, Twentieth Century-Fox; best sound recording, Nathan Levinson for *Yankee Doodle Dandy;* short subjects—cartoon, *Der Fuehrer's Face*, Walt Disney; one-reeler, *Speaking of Animals and Their Families*, Paramount (Fairbanks and Carlisle, producers); two-reeler, *Beyond the Line of Duty*, Warner Bros. (Gordon Hollingshead, producer); best film editing, Daniel Mandell for *The Pride of the Yankees*, Samuel Goldwyn, RKO-Radio; best scoring of a musical picture, Ray Heindorf and Heinz Roemheld for *Yankee Doodle Dandy;* best scoring of a dramatic picture, Max Steiner for *Now, Voyager*, Warner Bros.; best song, "White Christmas," from *Holiday Inn*, Paramount (music and lyrics by Irving Berlin); best special effects, *Reap the Wild Wind*, Paramount (Gordon Jennings, Farciot Edouart, William L. Pereira for photography, Louis Mesenkop for sound); best interior decoration (certificates of merit given to the decorators of the productions receiving the award for art direction)—black and white, Thomas Little for *This Above All;* colour, Thomas Little for *My Gal Sal;* certificates for distinctive achievement were presented to Charles Boyer, "for his progressive cultural achievement in establishing the French Research foundation in Los Angeles as a source of reference for the Hollywood motion picture industry"; Noel Coward, "for his outstanding production achievement, *In Which We Serve*"; Metro-Goldwyn-Mayer studio "for its achievement in representing the American way of life in the production of the 'Andy Hardy' series of films"; plaques for distinctive achievement in documentary production were presented to *Kokoda Front Line!*, *Battle of Midway*, *Prelude to War* and *Moscow Strikes Back*.

Outstanding pictures of 1943 included—

This Is The Army, Heaven Can Wait, For Whom the Bell Tolls, The Song of Bernadette, Madame Curie, So Proudly We Hail, Sweet Rosie O'Grady, Claudia, The Human Comedy, The More the Merrier, Watch on the Rhine, Behind the Rising Sun, Lassie Come Home, Shadow of a Doubt, Victory Through Air Power, The Ox-Bow Incident, Hitler's Children, Guadalcanal Diary, Princess O'Rourke, Johnny Come Lately, Casablanca and *Air Force*.

Among the outstanding films also should be included a number of documentary pictures. Productions of this type attained a new importance in 1943, in some cases occupying a position on theatre screens usually filled by a straight entertainment feature. Outstanding documentaries were *Desert Victory* (British), *Report from the Aleutians, Battle for Britain* and *Battle of Russia*.

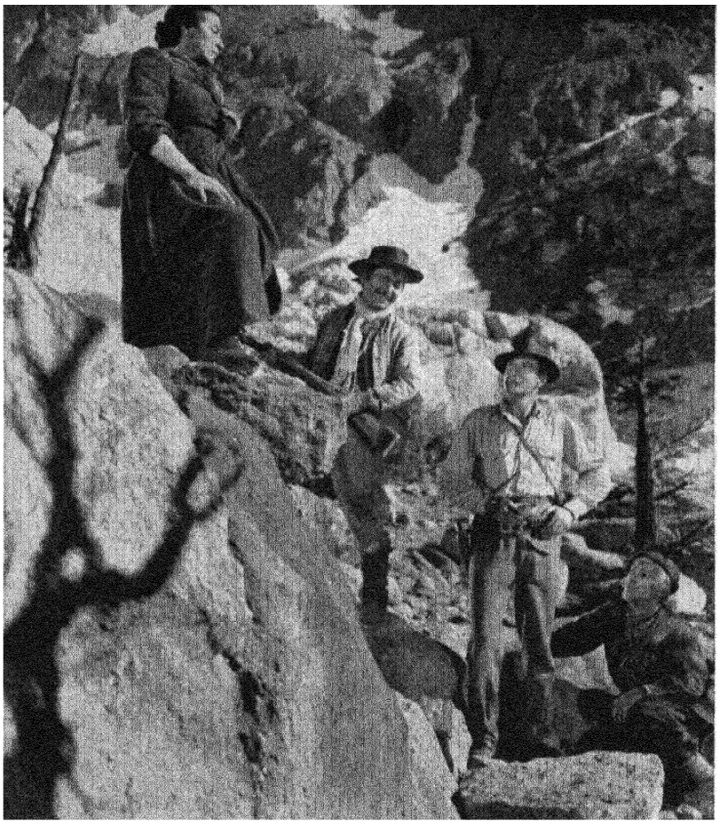
Battle-action documentaries were not obtained without risk and in some instances casualties in the photographic units ran high. (L. O. P.)

Technical Developments.—Restrictions on manpower and material increased, thus again preventing normal technical developments within the motion picture industry. A few developments previously well under way were continued to completion. The very nature of the restrictions placed on the industry forced changes in the technical processes and equipment which are worthy of note. Fewer pictures were made but the tendency was toward more elaborate and thus more expensive productions.

Set Construction.—The War Production board limitation of $5,000 in new material for set construction in any one production had two interesting results. Sets were definitely planned for use in several productions and second-hand material was employed wherever possible. Various studios purchased and demolished old buildings in order to secure the material for set construction. Paramount purchased a lumber mill in Oregon which was roofed with straight grain boards 6 in. thick by 12 in. to 16 in. wide. These timbers were remilled and provided considerable excellent lumber. The use of plastics increased materially. A part of this increase was the result of the inability to secure materials, particularly metal, but was also a natural growth resulting from the increased knowledge of plastics and their ready adaptability to motion picture requirements. Primary uses of plastics in the industry are for set dressing, hardware and costumes.

Dim-out Restrictions.—When the entire Pacific coast was dimmed out as a wartime measure, night photography on outside sets was banned. Thus all night shots were either photographed on covered sets with artificial lights or with natural light and suitable filters. The use of filters for securing night effects in the daytime is not new and is not entirely satisfactory. The best results were secured on outdoor sets which could be completely covered with canvas, thus largely but not completely eliminating natural light. Night shots so made were considered by many to be better than night shots photographed at night with artificial light because natural light filtering through the canvas permitted some desired background detail. Thus the practice of photographing night shots under daylight conditions with artificial light in canvas-covered sets may continue even though the dim-out regulations have been lifted.

Location Sets.—Restriction on transportation forced a reduction in location work. Some location shooting was, of course, continued but wherever possible it was replaced by miniature and processing photography.



Optics.—The use of antireflection coating on camera and projector lenses continued to increase. Processes for lens coating were further improved, particularly with respect to durability.

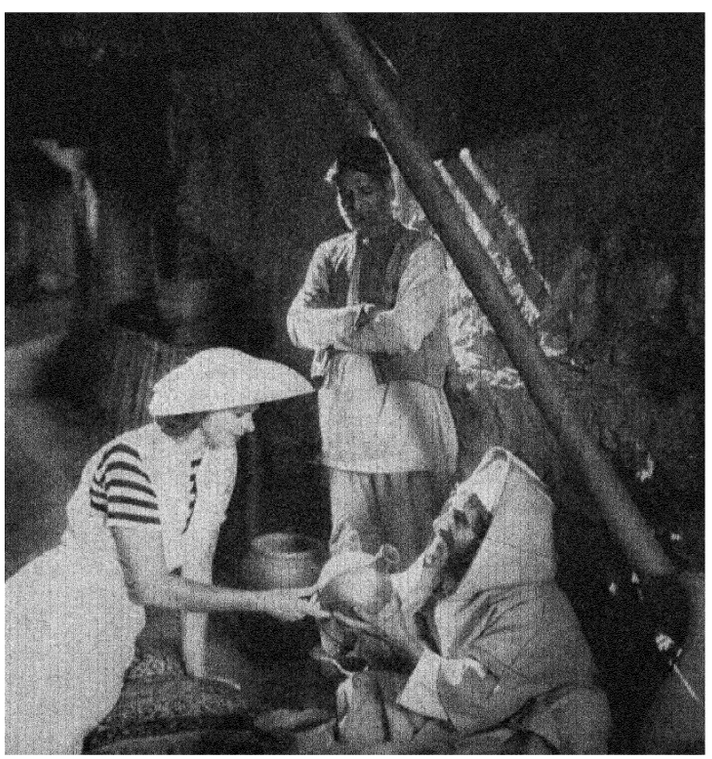
Camera lenses having the same focal length and the same f./ rating vary considerably in their efficiency of light transmission. Thus two lenses presumed to be alike may actually produce considerably different exposures of the film when photographing the same subject simultaneously. Since film laboratories develop on a time-and-temperature basis, consistent photographic results can only be obtained by accurate control of film exposure in the camera. Cameramen must work with different lenses, hence a knowledge of light efficiency of the lenses is necessary. This problem was solved at various studios, notably at Twentieth Century-Fox, by setting up one camera lens at a given f./ stop as a standard and calibrating all other lenses from this reference. By this process, the f./ system ceases to be a simple mathematical calibration and becomes an actual calibration based on equivalent light efficiency. Thus for the first time all lenses so calibrated and set at the same f./ stop will produce the same exposure when photographing the same subject.

Film.—No new films were introduced but fine grain films were further improved and their use was considerably increased throughout the industry. All major studios now release fine grain prints.

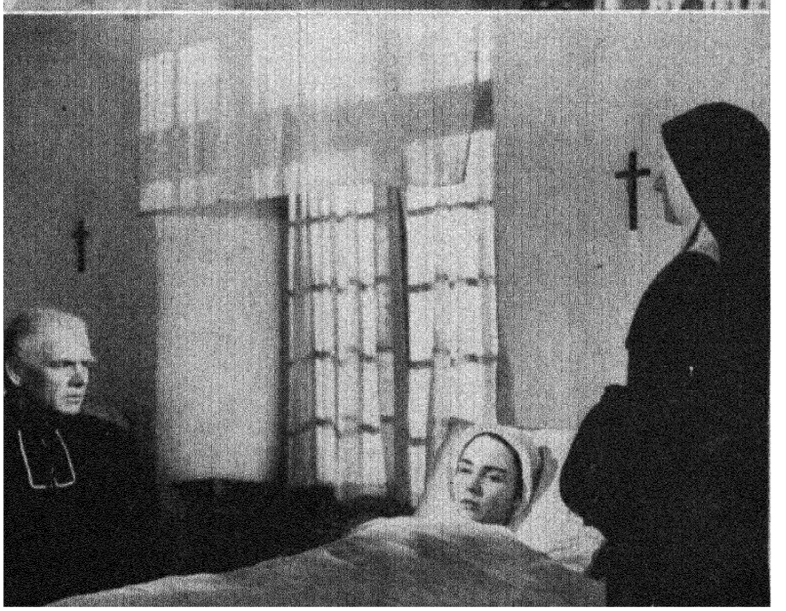
Film Processing Laboratories.—At Twentieth Century-Fox one new developing machine was placed in operation. It is basically of the Eastman-Capstaff design with modifications developed by Twentieth Century-Fox laboratory technicians. This machine is noteworthy because for the first time there is no measurable evidence of developer drag or directional effect.

Process Photography.—The slide projector developed at Paramount in 1942 was further improved in 1943 by the addition of a shutter similar to that employed on projectors except that the blades were made of Alco glass. Thus the shutter provides a reduction in heat on the slide almost equivalent to that which could be obtained with a metal blade shutter, while at the same time producing considerably less visual flicker on the screen. Photographically, of course, this flicker is not objectionable since it is timed with the camera shutter, but it is trying on the actors. In order to use this projector with Kodachrome transparencies,

Above, left: KATINA PAXINOU (left) with Gary Cooper (second from right) in *For Whom the Bell Tolls*. Miss Paxinou was named 1943's best supporting actress by the Academy of Motion Picture Arts and Sciences



Above, right: PAUL LUKAS (right) was voted best actor of 1943 for his role in *Watch on the Rhine*. Bette Davis (centre) was also starred



Right: MICKEY ROONEY (left) and Frank Morgan in William Saroyan's *The Human Comedy*, which won the Academy award for the best original picture story of 1943

Below, left: INGRID BERGMAN in *Casablanca*, which received the Academy award as the best motion picture of 1943

Below, right: JENNIFER JONES was the winner of the 1943 Academy award as best actress of the year for her role in *The Song of Bernadette*

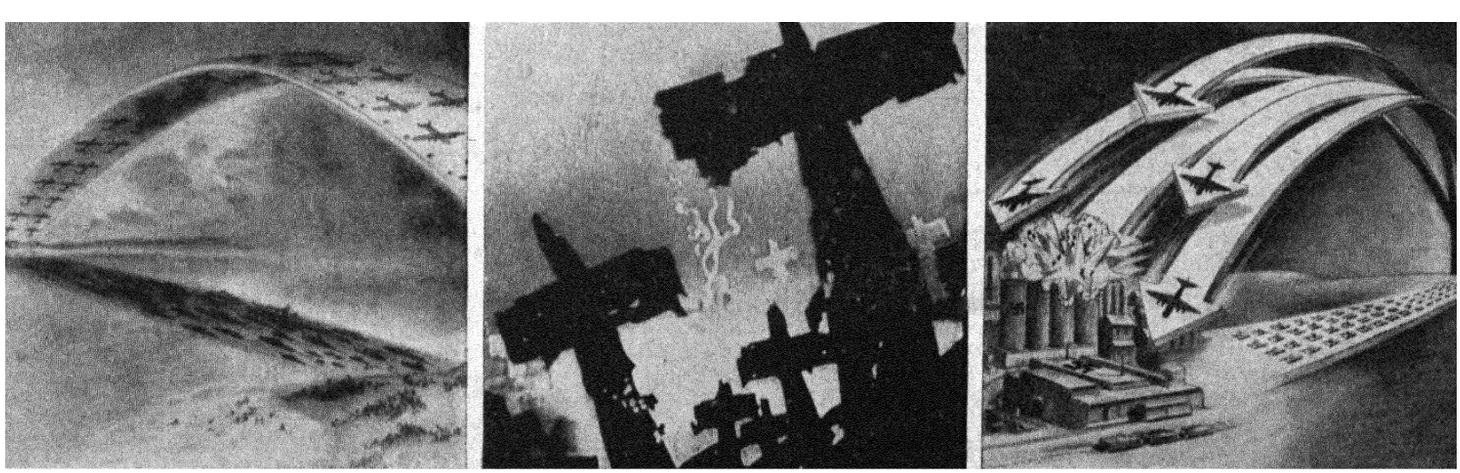
Paramount developed a system for rephotographing such transparencies to correct them for size and colour. They then developed a process for transferring the Kodachrome image from its film base to a glass base since the film base would obviously not stand the heat of this projector.

Colour.—The year 1943 found a general increase in the use of colour photography. Technicolor's Monopack process, while still in the experimental stage, was used in several productions. Monopack employed a three-colour process in which the picture is originally photographed on a single film containing three emulsions. This film is developed to a positive and is therefore similar to the well-known Kodachrome process. From this positive, the present technique provides for the making of three separation negatives from which prints are made by the Technicolor imbibition process. Ansco continued the development of a three-colour process where a single film carrying three emulsions is exposed in the camera and developed to a negative from which contact prints may be made in the usual manner. While this process was said to be in wide use for military purposes, it was not available to the motion picture industry in 1943. The process of photographing in 16-mm. Kodachrome and blowing this up for release in 35-mm. Technicolor continued to increase, notable examples being *At the Front in North Africa* and *Report from the Aleutians.*

Sound.—In spite of war restrictions, several studios modified their variable density recording equipment to permit original recording on 200-mil push-pull sound tracks, thus gaining the advantages of push-pull recording and an increase in signal to noise ratio. This material must, of course, be rerecorded to obtain a normal release negative. Many variable density users also added limiter amplifiers to their production channels. These amplifiers were variable gain devices designed to prevent excessive overload on high level signals. Variable area users employed a variable gain amplifier having a gradual characteristic of gain change vs. level and the limiter is an adaptation of this device. For many years it was the practice in some studios to record vocalists on a separate sound track from that on which the orchestra is recorded. Separation between the voice and the orchestra was obtained by use of uni-directional or bi-directional microphones and was never particularly satisfactory. In 1943 several studios constructed small rooms in conjunction with their scoring stages so that the vocalist might be acoustically isolated from the orchestra. The vocalist sees the picture and the orchestra through a suitable window and by means of headphones or controlled acoustical methods also hears the orchestra.

Increased use was made of a small dynamic type of receiver with a moulded plastic earpiece. These were similar to those employed in hard-of-hearing aids and provided better response, because of the close coupling with the ear.

Republic introduced a device for providing audible indication of the failure of synchronous camera motors to run at their correct speed.



Lighting.—No new lights or lighting methods were introduced but Paramount developed a light meter designed to measure accurately the actinic value of the light. Previous light meters had been sensitive primarily in the red or infrared range where the film had little sensitivity.

As a measure of conservation, Twentieth Century-Fox adopted the practice of protecting arc and incandescent lights with a shield of Tufflex glass. This is a tempered glass highly resistant to thermal shock. It prevents wind or rain from damaging the light itself.

Industry and Technical Contributions to the War.—A considerable percentage of the technical personnel of the motion picture industry entered the armed forces. Others affiliated with war research, development and manufacturing activities, thus reducing the available technical personnel in the studios to a minimum. Military personnel was trained by the studios in camera work. Training films continued to be produced in the industry although the army and navy were handling a large percentage of this work themselves. Sixteen-millimetre releases on selected pictures were provided for the military at the cost of the prints. Such releases were reported to be shown wherever U.S. military men were located.

The Research Council of the Academy of Motion Picture Arts and Sciences sponsored the development of a special portable sound-recording equipment for the signal corps. The design of this system was largely the work of the MGM sound engineers. Manufacturing companies who normally supplied sound recording, camera, lighting and similar equipment to the motion picture industry were engaged almost entirely in the manufacture of war equipment. New sound-recording, camera and lighting equipment would, no doubt, become available to the industry as the result of this wartime work. (W. V. W.)

Educational Motion Pictures.—In 1943 the U.S. government became the world's largest producer, distributor and user of films. Government expenditures for army, navy, air force, industrial and scholastic training films were approximately $20,000,000, or an average of about a dollar per trainee for the year. Experts estimated that films increased the speed of training 25% to 35%. Of greatest significance to educators was the new emphasis on techniques of utilization. The U.S. Office of Education ended the year with 98 films completed, 100 in production and 300 in plan-

ALEXANDER DE SEVERSKY'S BOOK, *Victory Through Air Power*, was turned into a Technicolor animated cartoon by Walt Disney in 1943. These three scenes show the British evacuation at Dunkirk under a protecting canopy of planes, a cemetery of German bombers in Britain, and the concentrated Allied bombing of Hitler's "European fortress"

ning stages. Utilization of each subject was based on a definitive visual aid unit. By the end of the year 25 such units were being distributed, including a 16-mm. sound film, a silent filmslide strip of 20 to 50 key shots from the film and an illustrated instruction manual. Federal Security Administrator Paul V. McNutt, in a statement on Dec. 28, 1943, declared: "These war training films, designed as a new type of teaching tool, are making educational history by teaching workers essential skills *motion by motion.* For example, engine lathe training requires 17 films; aircraft manufacturing skills will require more than 30 films." The USOE films during 1943 were made by 23 producing units in 8 states. The business of distribution was handled by contract with one firm, which sold by the end of the year about 30,000 prints.

For the armed forces the most active film production centre was that of the army signal corps, whose studio at Astoria, N.Y., completed with the aid of Hollywood experts some 500 subjects within 12 months, establishing a record in the documentary-film field. The U.S. navy bureau of personnel, through its staff of 80 audio-visual officers at all domestic and foreign bases, did outstanding work in film utilization.

While most film expenditures for training inductees were charged off as war expense, the Office of Education film program was put on a self-liquidating basis, in line with a congressional act providing for the amortization of the cost of USOE films in about five years. (W. LN.).

The notable wartime success of teaching army recruits and industrial workers by means of sound films was expected to result in the greatly expanded use of films in civilian schoolwork after the war. To meet this anticipated need *Encyclopædia Britannica,* on Dec. 11, 1943, formed a subsidiary company to be called Encyclopædia Britannica Films, Inc., which acquired the personnel and the approximately 200 teaching films of the Erpi Film Co., formerly the property of Western Electric Co. (*See* also PHOTOGRAPHY.)

Motor-Boat Racing. Motor-boat racing in the United States was virtually at a standstill throughout 1943, due to wartime restrictions on the use of gasoline for pleasure purposes and for competitive events. There were no regattas of national importance and outboard racing was confined chiefly to some local races in the middle west.

Only racing event of general interest was the 11th annual running of the Hearst Perpetual Gold Trophy Speedboat regatta, held at Long Beach, California, in August, and attended chiefly by California drivers and speed boat owners.

The winners were:

Class	Driver	Boat
Class A hydroplanes	Orville Brisbin	"Chiz-Briz"
Class B hydroplanes	R. S. Hooper	" "
Class C hydroplanes	William Schuyler	"If"
Class M hydroplanes	Howard Newton	"Baby Fox"
Class C racing runabouts	Lester Missall	" "
Class F racing runabouts	L. A. Ratikin	"Torpedo"
Class C service runabouts	Jos. Leanardo	"My Shadow"
Class 225-Cubic Inch	Kenneth Ingram	"Guess Who"
Class 135-Cubic Inch	Thomas Ince	"Dynamite"
Pacific Coast One Design	Elmer Cravener	"Pudgy"

Motor Buses: *see* AUTOMOBILE INDUSTRY IN THE WAR; MOTOR TRANSPORTATION.

Motor Cars: *see* AUTOMOBILE INDUSTRY IN THE WAR.

Motor Transportation. Despite shortages of manpower, materials and vehicles and the limitation of speed under which they were permitted to operate, the U.S. motor carriers in 1943 showed notable records of performance. To cite one instance, intercity buses carried in 1943 an increase of 44.1% in the number of passengers over the number carried in 1942 with an increase of 33.5% in passenger miles and revenue. The 31,000,000 passenger miles rolled up in 1943 included transportation of inductees to induction centres, members of the military travelling under individual orders and on furlough, and civilian travellers.

As far as the bus was concerned, a survey covering all classes of operation for the first nine months of 1943 indicated that all classes of carriers were carrying greatly increased loads, with more people being handled per bus than ever before. Passenger revenue per mile of line for city companies in 1943 ran at the rate of about 26% over 1942 with the revenue for the intercity carriers at nearly double that of 1943. Total operating revenue of the industry for 1943 was placed at about $1,006,000,000 and the number of passengers at 8,600,000,000.

As 1943 drew to a close passenger travel by bus and by train approached double that of the year previous. It was about four times as great as before World War II. Trains and buses operated with about the same amount of equipment they had before the war. So far as the bus and the truck were concerned there was promise at the end of 1943 that relief would be afforded by additional vehicles and in the amount of replacement materials. In the bus field, at the end of 1943, prospects pointed to the industry being permitted to build 6,960 new integral buses during 1944 compared with only 1,500 delivered in 1943 and about 11,000 in 1942. Actually the industry could absorb a great many more buses considering the more favourable prospect for replacement parts and appurtenances during 1944. The new figure of authorization was taken to mean that a maximum of 1,740 buses would be assigned to the intercity lines with a possible minimum of 1,392. Another hopeful prospect was that this figure might be revised upward due to probable windfalls in material and in the likelihood of an increase in manpower and in manufacturing facilities. The pressure for more buses for use in cities, especially war industry cities, was terrific. In the local or city field there was some restoration of service by street car where tracks and overhead were still in place. In all such instances, the buses so released were assigned to help out on routes already overcrowded or were used to establish new routes as an aid to the war effort.

In the truck field the production of 123,000 new commercial vehicles was approved for 1944. Of this number, however, only about 90,000 were to be for civilian use. The rest were for the U.S. Maritime commission, the U.S. Foreign Economic administration, the dominion of Canada and other noncivilian purposes. This 90.000 might be compared to normal prewar replacement production of 450,000 vehicles annually. The new trucks were to go into the civilian truck pool, which at the end of 1943 was virtually exhausted. They were to be doled out only for needs directly related to the war effort or to uses necessary to the civilian economy. In addition, the construction of 12,250 commercial truck trailers was authorized.

The Office of Defense Transportation reiterated its advice that truck operators redouble their maintenance efforts and regard their present vehicles as probably the last which they would be able to obtain until the end of 1944. As in the case of the bus industry ODT emphasized the need on the part of management to direct its efforts to preventive maintenance and the drivers to careful habits in handling vehicles entrusted to them. In 741 war plants checked in the fall of 1943, 65% of all incoming freight was carried by truck.

Both the bus and the truck industries were plagued through the year by the manpower problem. This was true in respect to both drivers and mechanics. In World War II, a war of movement by motor vehicle, there was great need by the armed forces

for all classes of mechanics. Faced with the drain on its personnel the bus industry made good use of women both in the shops and on the vehicles. In helping to ease this situation the Office of Defense Transportation set up well-organized training programs intended to develop personnel for use in both these categories. Thus on Dec. 6, 1943, the Office of Defense Transportation issued "Transportation Training," the first of a series intended primarily to acquaint transportation company officials with training programs and information of help to them in meeting their manpower problems. In addition the bulletin discussed the upgrading or supplementary training for employees already in the service and set forth new methods and techniques for meeting the problem of recruiting new employees. Help in meeting the critical manpower situation was also forthcoming in tangible form as a result of the 130 Office of Defense Transportation-War Manpower special training classes conducted throughout the country for motor mechanics. In Nov. 1943, it was announced that men and women students were soon to be available from the 72 cities in which the ODT and the WMP had been conducting classes. It was estimated that the intercity bus carriers needed 22,000 workers for replacements and local transit lines 55,000.

Shortages of tires, repair parts, new equipment and manpower, plus restrictions on road speed and other regulations, limited the carrying capacity of trucks, buses and automobiles to a point far below the demands of service they render. These findings from a source outside of the industry (the Truman committee investigating the national defense program) are cited because they emphasized the record which both the bus and the truck made under the most unfavourable operating conditions.

On Oct. 11, 1943, the War Production board amended its limitations order so as to assign a priority rating equal to military production to parts for medium and heavy trucks, trailers and buses. In the opinion of the Truman committee the War Production board delayed the parts production program by not having a survey as soon as the problem became apparent. To permit a vehicle lacking only one vital functional part to be laid up and rendered useless while a new one was being built seemed poor economy. The extent to which the parts shortage worked to the detriment of the industry is indicated by citing figures compiled by the Office of Defense Transportation which disclosed that 292% more vehicle-days were lost by buses in Aug. 1943, because of parts shortages than in Aug. 1942, 271% more lost by for-hire trucks and 175% more lost by private trucks.

In any discussion of motor buses sight must not be lost of the place which these vehicles play in the national economy as an aid essential to the educational program. There were in 1943 about 85,000 school buses and on them 4,000,000 children were transported daily. No accessions were made to this fleet. It is true that the school buses had priority on supplies of parts and of gasoline, but that alone was not enough. The problem was tackled early and vigorously. Of great help to the educators and the public officials who had to wrestle with it were the general suggestions set down in pamphlet form as a result of the work conferences held at Yale university and at Washington in the summer of 1942. (*See* also AUTOMOBILE INDUSTRY IN THE WAR; HORSES; MUNITIONS OF WAR.) (C. W. S.)

Other Countries.—Since more up-to-date figures were not available and, even if available, would be useless as a guide to the motor transport on the roads, the numbers of motor vehicles in the principal countries of the world in 1939 are given.

Motor Vehicle Registrations, Exclusive of U.S., in Early 1939

Country	Private Cars Taxis '000's	Trucks Buses '000's	Total '000's
United Kingdom	1,916	626	2,542
France	1,750	500	2,250
Germany	1,306	402	1,708
Canada	1,161	220	1,381
Australia	552	252	804
U.S.S.R.	85	593	678
Italy	303	86	389
Union of South Africa	294	45	339

The year 1943 showed no great change in the numbers of vehicles as compared with 1942. Such change as there was continued the decline in numbers. In Italy, for instance, in that part under German control, all private cars were commandeered, and the position in France was little better. In Great Britain all gasoline for private cars could be used only for purposes which were particularized, and the quantities allowed were cut to a point which made it a matter of difficulty to make the allowance adequate for the work to be done. The purposes which supported a claim for a supply of gasoline tended to be examined more closely and to be further curtailed. This applied to public services as well as private cars. Bus services in Great Britain for instance were reduced somewhat during the year. (*See* also ACCIDENTS; RAILROADS.) (W. T. ST.)

Motor Vehicles: *see* AUTOMOBILE INDUSTRY IN THE WAR; FEDERAL BUREAU OF INVESTIGATION.

Mountbatten, Lord Louis (1900–), British naval officer, was born June 25 in Windsor, England, as Louis Francis Albert Victor Nicholas of Battenberg. His mother, Princess Victoria, was a daughter of Louis IV, grand duke of Hesse, and a granddaughter of Queen Victoria. His father, Austrian-born Prince Louis of Battenberg, grandson of Louis II of Hesse, resigned as an admiral of the British navy in 1917 because of anti-German sentiment and changed his name to Mountbatten. Lord Louis entered the British navy as a midshipman at the age of 13 and served throughout World War I. He rose through the grades until, in March 1942, he was made acting vice admiral. Early in World War II his gallantry and daring attracted attention when he brought the destroyer "Kelly" to port twice after it was damaged, first by a mine and the second time, apparently hopelessly, by a torpedo. In the fall of 1941 he was ordered to the United States to take over the command of the "Illustrious," which was undergoing repair. Before he was able to take his new command out of port, however, he was ordered back to England for an undisclosed assignment. Not until April 1942, was it revealed that Lord Louis had succeeded Sir Roger Keyes as leader of the Commandos, whose daring raids over western Europe had become legendary. His title was Chief of Combined Operations, and in March he had been made acting vice admiral. During 1943 he attended the Casablanca and Quebec conferences. At the latter, in Aug. 1943, was announced the creation of the new Southeast Asia command and the appointment of Mountbatten as its commander in chief. On Sept. 10 he was made acting admiral for the duration of his post. In December he announced that he had merged the British and American units under the command of Air Chief Marshal Sir Richard Pierse.

Mount Holyoke College. An institution for the higher education of women in liberal arts, founded in 1837 by Mary Lyon and situated at South Hadley, Mass. In 1943 the naval reserve midshipmen's school (WR), established on the campus in 1942, was changed to the Naval Training school (WR) for graduate WAVES, Marines and SPARS. Some of the college facilities were turned over to the United States navy without decreasing the college enrolment. For statistics of student enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. G. HA.)

Mowinckel, Johan Ludwig (1870–1943), Norwegian politician, was educated at Oslo university and at schools in Germany, England and France. A shipowner, he entered politics in 1899 as town councillor of Bergen and held, concurrently, the post of president of the Bergen council. He later became a member of the Norwegian Storting and served as president of that body from 1913 to 1921. He was president of Norway's League of Nations delegation, 1928–30 and 1933–34, and president of the League council in 1933. He was prime minister and minister of foreign affairs, 1925–27, 1928–31, and 1933–35. He went to the United States after the nazi occupation of Norway in 1940 and died at New York city, Sept. 30, 1943.

Mozambique: *see* PORTUGUESE COLONIAL EMPIRE.
Mules: *see* HORSES.

Municipal Government. The outstanding trend in local U.S. government in 1943 was the swing in emphasis from "war" to "postwar" in official municipal thinking. The year ended in a plethora of postwar plans, culminating in the much heralded $100,000 fee plan of New York Park Commissioner Robert Moses and staff for the Portland, Oreg., local government area. Financial conditions appeared bright on the surface without, however, encouraging much confidence that any permanent basis of improvement had been laid. The marked reaction which set in against federal or state domination was officially reflected in the resolutions adopted by the American Municipal association at its annual conference in October, which among other matters called for the return to local governments of all local functions assumed by the state and federal governments during the depression and war emergencies, and the maintenance and encouragement of independent local government under plans for the sharing of federal and state collected revenues with local governments.

Activities Related to the War Effort.—Civilian defense measures continued in effect, though with dwindling emphasis as dimout regulations were removed in coastal cities toward the close of the year. The larger cities carrying war damage insurance had for the most part expressed their intention to renew. Victory gardens were encouraged through availability of city-owned land. Intermunicipal co-operation was greatly accelerated, particularly in police and fire services; 20 or so states expressly authorized such co-operation in health, personnel, planning, police, fire and other services.

The major war problem centred on the excessive burdens placed on local government in the congested war industry areas. Additional funds ($200,000,000) were authorized by congress under the Lanham act to help finance the public works and other community facilities so urgently needed; also ($300,000,000) for the greatly increased construction during 1943 of war housing for in-migrant workers. A federal Committee for Congested Production Areas, consisting of representatives from the war and navy departments and other federal wartime agencies, headed by Harold Smith, director of the budget, was established in April in the executive office of the president, to co-ordinate federal activities affecting problems arising out of congestion and to supplement the efforts of state and local governments in meeting the economic and social problems involved. By the end of the year the committee had assisted in the procurement of ice manufacturing facilities, sewer construction authorization, child care program development, a Negro recreation centre, garbage removal, and construction of access roads to industries. It had established area representatives in the following six areas: Hampton Roads, Va.; San Francisco bay; Puget sound; San Diego; Portland, Oreg.-Vancouver, Wash.; and Mobile, Ala. Reporting in December, a house naval subcommittee which investigated critical housing, health, food, transportation and other conditions in the congested Los Angeles-Long Beach sector, urged the addition to the federal committee of a representative for that area as soon as possible.

Personnel.—By October, representatives of federal, state and local civil service agencies reported that from approximately 3% to approximately 25% of civil service personnel were on military leave, or about 10% in the majority of jurisdictions. Most agencies were making war service appointments, that is, temporary appointments without civil service status. In municipal police and fire personnel, already 11% undermanned, a possible further loss of one-third following the drafting of fathers was anticipated. Some cities were successful in securing deferment for police and fire personnel, and some not: they were obliged in every case to take up the matter on an individual basis with local draft boards. In Miami and Norfolk military police and shore patrolmen were used to relieve the shortage of regular police officers.

Women were employed in a variety of capacities normally reserved for men: as street car and bus operators, traffic officers, fire inspectors, fire fighters, street cleaners, garbage collectors, park workers and personal property tax appraisers. A few communities experimented with employing high school boys in garbage and refuse collection, at city nurseries, even as regular firemen.

Wage and salary increases for municipal personnel continued apace. Local governments were expressly exempted from compulsory federal control of salaries and wages, though expected to conform to the national stabilization policy. Wartime pay adjustment plans were for the most part on a sliding scale, a flat percentage, or a cost-of-living basis. Detroit, facing intense industrial competition, achieved the distinction of having the highest paid municipal personnel in the country.

The turnover in municipal personnel increased the need for in-service training programs, particularly in such services as fire and police, confronted as they were with new social, economic and defense problems calling for training in the use of new types of equipment and of new techniques. A noteworthy manual, *Techniques of Law Enforcement Against Prostitution,* was compiled by the National Advisory Police committee, set up by the Federal Security administrator, and distributed to mayors, city managers and police chiefs, describing the best procedures developed throughout the United States in the control of venereal disease. In the civilian defense field, information reported early in 1943 indicated that more than 1,000 cities had trained a total of 201,617 auxiliary policemen—an average of 27 for each 10 regular employees—and 194,854 auxiliary firemen—or 29 for each 10 employees.

The American Municipal association and American Society of Planning Officials, in co-operation with state leagues of municipalities, inaugurated "postwar planning institutes" designed to aid municipal officials in the making of really comprehensive postwar plans. The University of Pennsylvania sponsored in-service training courses for state and local public officials under the direction of the Institute of Local and State Government. An in-service training course in fuel conservation was given by New York city to employees responsible for operating heating installations for the city. Many former municipal administrators, after receiving military commissions, attended the U.S. Army School of Military Government at Charlottesville, Va., and were in 1943 functioning in occupied areas abroad.

Finances.—Municipal finances presented the most favourable picture in many years. Revenues on the whole were satisfactory, with slight gains reported here and there from non-property tax sources, also some losses in the returns from gasoline taxes,

automobile use taxes, parking meters, and business and occupation taxes. Several states allocated new or increased shares of state collected taxes to municipalities and other local units. California and Washington made direct appropriations to local governments for the relief of emergency war conditions. Any undercurrent of anxiety pertaining to revenues related more to the uncertainties of the postwar period than to current conditions.

Expenditures were not generally increased, with the exception of the heavy war industry cities where marked increases in such essential services as street maintenance and repair, garbage and refuse collection and disposal, and street cleaning costs were reported.

The question of tax losses due to federal acquisition of real property for war purposes loomed to the fore. Proposals for a solution were offered by the Federal Real Estate board in its *Federal Contributions to States and Local Governmental Units with Respect to Federally Owned Real Estate,* which the president duly transmitted to congress (House Document no. 216). The situation regarding payments in lieu of taxes on government-financed war housing projects also brightened considerably, with an estimated $13,000,000 to be paid in lieu of 1943 taxes, all cities being put on a common basis in this respect.

Current tax collections continued high. Tax rates decreased an average of $.35 per $1,000 of assessed value for the year 1942–43 for all cities of over 30,000 population, while assessed values enjoyed a slight average increase. This trend did not hold, however, for the group of cities over 1,000,000 in population, where tax rates increased an average of $.56 and assessed values continued their decline.

Municipal borrowing continued at a low ebb. The total of state and municipal sales for the year approximated only $505,000,000, the bulk of which were refunding and not new issues. Municipal bond yields reached an all-time low of 1.69% on Nov. 1, according to the *Bond Buyer's* index based on bonds of larger cities. On Dec. 1, the index stood at 1.82%. The net long-term debt of all cities of over 25,000 population, approximating $8,000,000,000, declined 4.2% during 1942–43, and was less than in any year since 1932. Short-term debt declined even more precipitately, totalling about $261,000,000, a decline of 6%. New York city reduced its net long-term debt by about $100,000,000.

In March of 1943 the special Committee on Intergovernmental Fiscal Relations appointed by the secretary of the treasury issued its monumental study, available from the superintendent of documents as Senate Document no. 69, 78th congress, 1st session under the title: *Federal, State, and Local Government Fiscal Relations.* The recommendations of the committee received wide publicity in local government fields. The Municipal Finance Officers association went on record at its annual conference as commending this report, which was subsequently termed comparable to the famous Rowell-Sirois report in 1940 on Canadian Dominion-Provincial Relations. Of the committee's recommendations, the proposal to create a permanent three-man federal-state tax commission to work out methods of central-local tax cooperation and the proposal for supplementing the municipal property tax with a rental tax on occupiers aroused the most widespread interest.

Postwar Planning.—Under the auspices of a special advisory committee on wartime and postwar planning set up by the International City Managers' association, an illuminating survey of postwar planning activities in 92 city manager cities was undertaken in May 1943. The great majority were found to be assembling data on postwar conditions regarding population, employment, conversion of war industries and public works. Most of the larger cities had official planning agencies. Nearly all had established reserves for the postwar period, by setting aside cash from surplus funds, investing surplus funds in war bonds, setting up depreciation accounts for replacements and repairs, or by paying off debt.

In a symposium conducted by the *American City* magazine in nine issues from Nov. 1942, to Sept. 1943, 249 municipalities in all parts of the United States reported on planning improvements to be undertaken after the war; 140 of these were setting up financial reserves for this purpose.

Twelve additional states enacted legislation authorizing municipalities to set up postwar reserves, bringing the total of such states to 21. Such reserves were established also in other states by cities under home rule charter provisions and other state laws regulating investment of local funds.

On the federal level, the National Resources Planning board in its *National Resources Development; A Report for 1943* encouraged the making of plans by municipalities, in co-operation with the state and federal government (Part I: Postwar Plan and Program). After the liquidation of that board by congress, the enactment of federal measures on postwar planning, including financial aid to cities, was dropped, presumably pending issuance of a report by the Senate Committee on Postwar Economic Policy and Planning. However, two measures contemplating aid to cities for urban rebuilding, the Thomas bill and the Wagner bill, were introduced.

Proportional Representation Elections.—The 1943 proportional representation election in New York city resulted in a reduction in size of the city council from 26 to 17, because of the fixed quota provisions of the charter, and in the election of two Communists and a left-wing labour leader to the council. The other eight American cities holding P.R. elections in 1943 were: Cincinnati, Toledo and Hamilton, Ohio; Cambridge and Lowell, Mass.; Yonkers, N.Y.; Wheeling, W.Va.; and Boulder, Colo. P.R. was adopted for the first time in the little resort of Long Beach, Long Island, N.Y.

Council-Manager Cities.—Nine American cities adopted manager government during the year; three others which had previously done so were counted for the first time, making a total of 555 cities and seven counties under manager government in the United States.

Miscellaneous.—In tacit acknowledgment of municipal home rule, the wage stabilization policy, unemployment stabilization regulations, and 48-hour work week requirements of the federal government, were not made binding on cities, though a number voluntarily co-operated. On the other hand, a pending measure to provide federal aid to education was vigorously opposed on the ground of endangering home rule. Opposition to federal proposals for urban rehabilitation developed for similar reasons. Much of the local initiative in postwar planning was inspired by fear that the state or federal governments might otherwise take the lead after the war. (*See* also HOUSING.) (A. M. Ds.; L. GU.)

Munitions Assignment Board (U.S. and Great Britain): *see* BRITISH-U.S. WAR BOARDS.

Munitions of War.

The finest body of men that could be assembled is powerless to wage and win wars if the tools of war are not furnished.

The record of the United States for 1943 in the procurement and production of munitions of war was one to be proud of. Applied to fighting on world-wide fronts, the term "munitions" covers some 700,000 different items, ranging from tanks and cannon to shoelaces and spoons. To review the status of the entire scale is obviously impossible. However, data concerning a representative cross section of the munitions field will throw some light on the production effort in America in 1943. In the first five months

of 1943, the volume of tonnage moving in and out of installations in the United States averaged slightly over three and one-third million tons per month. This is significant, since prior to 1939 there was no armament industry.

Fortunately, the necessary plans and specifications had been prepared and were in readiness in the files of the United States army ordnance department. These plans were keyed to the extremes of the industrial world—the plant with less than 100 employees had its place in the scheme of things alongside the industrial giant with thousands on its payrolls. The need of factory conversion to war production had been recognized and blueprinted in advance; the mechanics of contracting and subcontracting had also been carefully integrated. How well ordnance department planning met the challenge of war can be realized in some degree from figures released late in 1943 in "Army Ordnance Report No. 3," wherein it was shown that, based upon dollar for dollar production, the United States ordnance department in just two years had grown over 35 times greater than the General Electric Co. had in 43 years.

During the year 1943, the war department announced that awards of army-navy "E" for excellence in production of war materials for exactly one year amounted to 1,910, of which 1,188 were nominated by the army and 722 by the navy. A total of 1,598 companies were represented, 1,042 manufacturing primarily for the army and 556 for the navy. The awards covered plants composed of a single employee to one hiring more than 126,000 workers.

To the Munitions Assignments board fall all problems concerned with the entire science of logistics. These problems ranged from the assignment of equipment to guerrilla bands to shipment of railroad locomotives. When the British 8th army went into action it had, in addition to British-produced munitions, the latest American tanks and self-propelled, high calibre American antitank guns.

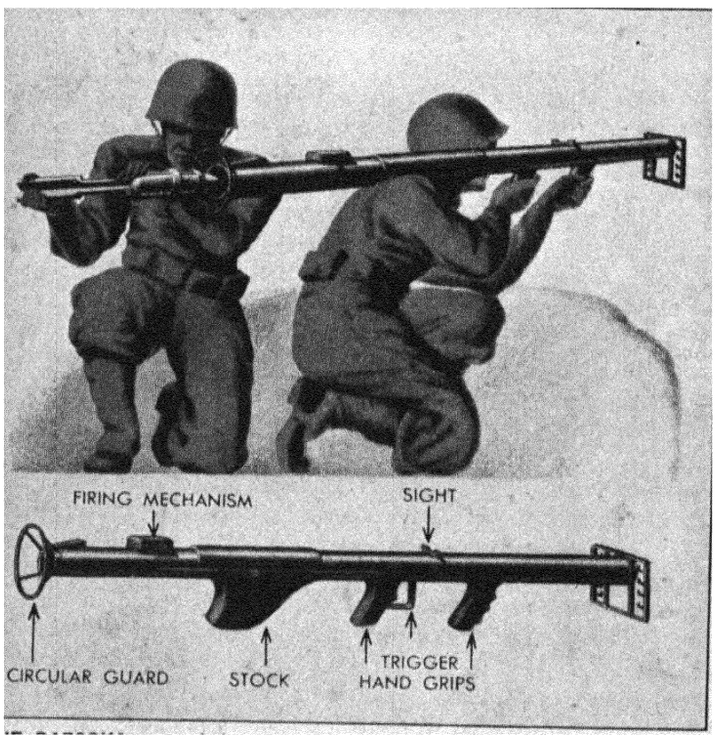
Comparative figures at like calendar points in 1942 and 1943 showed the tremendous increase in munitions procurement and production. Taking April 1942 and April 1943 as marker points, it can be shown that the ordnance department accepted delivery in 1943 of ordnance material valued at $1,112,206,000 as compared with $444,324,000 the preceding year; more than three times the number of tank and combat vehicles were accepted; deliveries of self-propelled artillery were in some instances 16 times greater; deliveries of all types of artillery were up 258%; more than 10 times as many light antiaircraft guns were accepted, while acceptances of 75-mm. and 105-mm. howitzers jumped almost 50%; there was a threefold increase in deliveries of 60-mm. and 81-mm. mortars; deliveries of bombs, shells and bullets kept pace with a triple increase.

The character of munitions delivered displayed the ability of American factories to meet the needs of war. General Sherman 32-ton tanks were emphasized rather than the preceding year's General Stuart 13-ton tank. In the realm of self-propelled artillery there were produced the M-12 tank destroyer, a 155-mm. gun mounted on a medium tank chassis, and a 105-mm. howitzer mounted on M-7 tank chassis. The infantry mortars delivered won renown in Tunis, where they were reputed to have dropped their shells "into the hip pockets" of the axis infantry. Types of bombs and shells produced ranged from 20-mm. shells and small incendiary bullets to 16-in. coast artillery shells and 2- and 4-ton block busters. Antitank and antipersonnel mines were produced in huge quantities. Antiaircraft artillery with a lethal 60,000-foot vertical range was produced. Included in the year's deliveries were some items not produced at all the preceding year—fragmentation bomb clusters, medium and heavy howitzers, new types of tank destroyers and self-propelled guns, armoured reconnaissance cars and heavy tank-recovery vehicles designed to bring in disabled tanks from the battlefields. For 1943, provision was made for the United States ordnance department to buy $17,300,000,000 worth of artillery, tanks, motor vehicles, bombs, rifles, ammunition, machine guns and aircraft cannon. One piece of artillery was being provided for every 46 soldiers in World War II, as compared with one piece for every 1,100 soldiers in World War I.

Munitions developments for the year included:

Ammunition.—In 1918, the United States produced small arms ammunition at the rate of 278,000,000 rounds a month; in 1943, that amount was produced every week. For World War I, the United States produced 2,700,000 artillery shells a month; for World War II, 18,000,000 a month. In January, more than 70,000 aircraft bombs of 1,000-lb. size or larger were produced by American industry. In February, the United States produced 1,932,000 high explosive shells of all calibres, 419,000 bombs, and 1,244,000,000 cartridges of calibre .30, .45 and .50 ammunition. Thus, the United States in 1943 produced enough rifle and machine-gun ammunition each month to fire 83 rounds at every individual soldier in the axis. Production of ammunition for 1943 increased 550% over the preceding year. In one arsenal alone, each employee produced for the 12-mo. period an average of more than 47,000 rounds of small arms ammunition of calibres .30 and .50. A deadly bullet christened the "Blue Goose" was developed. It is fired from a .50-calibre machine gun, pierces gasoline tanks, to explode inside, where it starts a chemical fire of intense heat.

Armour.—As protection against bursting ack-ack shells, many airmen wore in 1943 infantry helmets along with flexible armour from neck to hips, with a sporran protecting the thighs.



Artillery.—Artillery may be classified as horse-drawn, pack, truck-drawn, self-propelled, railway, coast defense, aircraft and antiaircraft. Bombing planes are, in effect, long-range artillery and artillerymen are no longer the sole persons to man artillery. The smallest cannon, the 20-mm., was an aircraft weapon. Rated as infantry and cavalry weapons were the 37-mm. gun M-3 (antitank), the 60-mm. mortar M-2 and the 81-mm. mortar M-1. Field artillery is classified as: light—pieces up to and including the 105-mm. howitzer; medium—such as the 155-mm. howitzer and the 4.5″ gun; and heavy—the 155-mm. gun, the 8″ and 240-mm. howitzers and seacoast artillery ranging from 8″ to 16″. The development of true "flying artillery" really takes field weapons "upstairs."

One of the surprising weapons of 1943 was the 4.2″ chemical mortar. It is a rifled weapon with a 2-mi. range and was designed originally to throw smoke shells, particularly white phosphorus, whose particles burn in air after bursting and cling flaming to any surface. However, it was found that the mortar handled a 25-lb. shell, packed with an 8-lb. high explosive charge, exceptionally well, and invasion forces in Sicily and Italy used the mortar with excellent results; in fact, it was referred to by the enemy as a "miracle gun." In the heavy artillery class, the army put the M-10 into mass production. This weapon was designed as a tank destroyer and was, in effect, a land cruiser capable of coping with anything in battle. In its manufacture, sections were fabricated from armour plate wherever possible and machine welding was extensively used to save time. Another heavy antitank weapon was the M-12, a 155-mm. gun mounted on a medium tank chassis and capable of attaining the speed of a medium tank. This weapon, exceedingly mobile, could hurl a 95-lb. projectile more than 10 mi. with sufficient force at that range to knock out any tank or sink a battle cruiser. In North African fighting, self-propelled weapons brought down enemy planes and violently disrupted German communications lines. The ordnance department standardized gun motor carriages for 37-mm., 75-mm. and 105-mm. howitzers. In the smaller armament realm, there

was noted a production record in one month of 7,000 aircraft cannon of 2-mm. calibre. Armament of aircraft demonstrated how far the United States had come along since 1918, when the ordnance department announced the installation of 75-mm. cannon in army air force planes. First tested from B-18 aircraft, it was finally proved practicable, so that in 1943 it was a fact that a gun of the same size but of greater power than the field artillery most in use in World War I could be fired from aeroplanes with speeds of more than 300 mi. per hour. This weapon knocked out any tank in use, could sink any lightly armoured warship and destroy enemy gun emplacements. Two other important aircraft weapons were the 37-mm. automatic cannon and the .50-calibre aircraft machine gun with its incendiary and armour-piercing ammunition.

Battery.—Most chemicals which activate a "dry" cell become virtually inert at subzero temperatures. Experimentation during 1943 sought to develop a battery that would not become less active at low temperatures. The meteorological section, signal corps, hit upon the plan of keeping batteries at normal temperatures by containing them in a thermos bottle.

Bazooka.—This Yank-christened instrument enabled the individual soldier to stand his ground against any tank. In African operations, one shot from a bazooka forced the surrender of a small but strong fort. This weapon was a metal tube slightly over 50 in. long and a little less than 3 in. in diameter, open at both ends. Attached to the tube were a shoulder stock and front and rear grips for the firer, together with sights and an electric battery which set off the rocket propelling charge when the launcher trigger was squeezed. The bazooka was operated by a two-man team—one the firer, the other the loader. When the bazooka was in firing position, the loader was at the right and rear of the firer. After loader placed rocket in tube he turned a contact lever to the "fire" position, signalled "ready" to the firer, then dropped down and away from rear end of the tube. When firer squeezed the trigger, the rocket propelling charge was ignited and flashed from rear of tube. The rocket itself was heavier than a hand grenade and was nearly 2 ft. long. It was highly effective against tanks and pillboxes.

THE BAZOOKA or rocket gun enables a foot soldier to operate effectively against armoured vehicles. The drawings show the weapon itself and a two-man bazooka team, consisting of a firer and a loader, in action. Although it is only about 50 in. long and weighs about the same as a Springfield rifle, the bazooka fires a projectile which can penetrate 3 in. of armour

Binoculars.—Optical glass manufacturers co-operated to standardize the types of binoculars fabricated for issue. Thousands of splendid instruments were turned in gratuitously by civilians for military use.

Brass.—By reason of a process perfected at the Evansville ordnance plant and Frankford arsenal it was possible to substitute steel for brass in the manufacture of .45-calibre ammunition. This made possible the saving of 1,774 lb. of brass for each 100,000 rounds of this type ammunition.

A further savings, estimated at 365,000 lb. of brass annually, was made possible by substituting plastic for brass in enlisted men's uniform buttons and collar insignia. In addition to the metal savings effected, the plastic material had the added advantages of not reflecting light and of being nontarnishable.

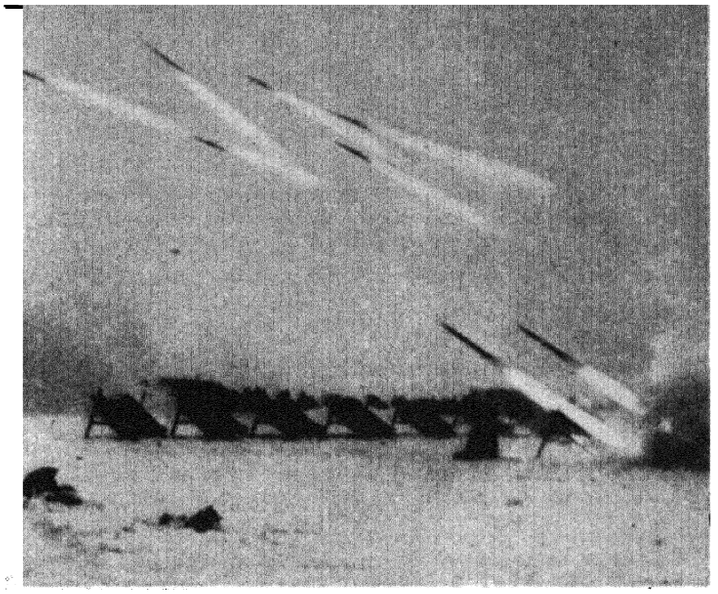
Canisters.—Gas mask canisters, formerly filled with activated charcoal produced from hard-to-get cocoanut shells, were to be filled with charcoal produced from sawdust, wood, coke and even coal. The new product was superior to the old in its ability to absorb toxic gases.

Drinking Water.—In New Rochelle, N.Y., manufacture was begun of a device called "Sunstill" to convert sea water into drinking water. A new water testing kit devised by the army determined the calcium hypochlorite content of water by use of the chemical agent known as orthotolidine.

Duffel Bag.—Patterned after the marine corps bag, this new type duffel bag was designed for troops going overseas. It was made of single-ply No. 10 duck, was 37 in. high on a 12-in. square base; it had a snap-fastening device at the top, was equipped with a carrying strap and was dark olive-drab in colour.

Engine.—A new tank engine was satisfactorily tested. It was 500-h.p., 8-cyl., liquid cooled and relatively light-weight because of secondary aluminum used in its construction.

The Packard Motor Car Co. built a new engine for P-51 planes. It had greater than 1,500 h.p. and its perfection had the effect of raising aerial warfare nearly two mi.

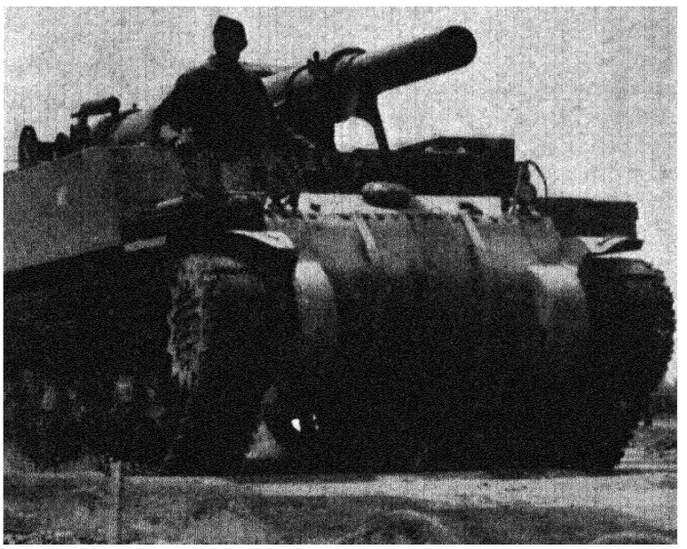


Gas Mask.—A new light-weight gas mask was developed as suitable for desert and jungle warfare. It had a 20-in. hose connecting face piece to a canister which gave protection against all known gaseous agents. There was also developed a new, waterproof gas mask kit.

A new type gas mask was developed for horses and mules. There were two types, M-4 designed for pack and draft animals, and M-5 for cavalry horses. Both were very light and had close-fitting muzzle pieces connected by flexible hose to canisters. They resembled human gas masks and animals were afforded enough air to walk, trot or gallop in comfort while adequately protected against field concentrations of known chemical agents.

Gasoline.—The fuel and lubricants division, office of the quartermaster general, working in co-operation with the ordnance department, perfected an all-purpose, all-weather gasoline designed to meet year-round combat requirements of all army ground force vehicles. It was standardized at 80-octane and its development was the result of three years' experimentation.

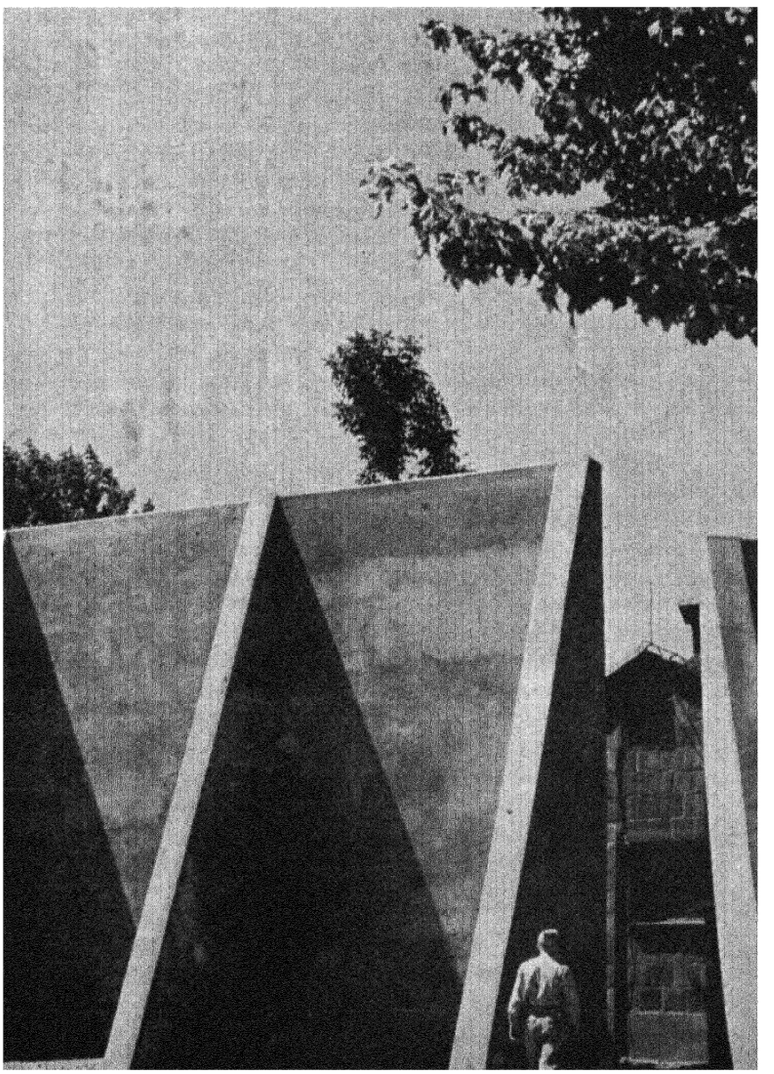
Gasoline Tank.—To be used in starting equipment in very cold weather, a two-compartment gasoline tank was devised; one tank contained 1 qt. of high vapour pressure priming gasoline, the other tank held a gallon of ordinary gasoline. The starting mechanism was needled with the high test gas and then switched to the ordinary type.



Glass.—Chemists of the American Optical Co. invented a coating which made glass nonreflecting and practically invisible. Glare was eliminated. For the duration of the war, use of this coating process was restricted to military purposes.

RUSSIAN ROCKET GUNS ranged in batteries, being fired at the Germans before Stalingrad. They are called "Katiushas"

U.S. SOLDIERS examining the famous German "Tiger" tank



U.S. MOBILE 155-MM. GUN, mounted on a medium-tank chassis, was the latest version of self-propelled artillery in 1943. Throwing a 95-lb. shell ten miles, it could knock out any tank in existence

DETAILS OF THE FAMOUS U.S. "BAZOOKA," rocket gun manned by two soldiers which is powerful enough to knock out a heavy tank, were revealed in 1943. It is a 50-in. tube open at both ends and equipped with an electric battery which sets off the rocket-propelling charge in the projectile

CONCRETE BARRICADES at Picatinny arsenal, Dover, N.J., separate buildings to lessen the effects of explosions

Grenades.—Rifle grenades, previously fired only from Springfield rifles, were fired by a special type of blank cartridge from Garands and from carbines. These grenades were practically one-man tank busters.

The Chemical Warfare service developed coloured smoke grenades which throw off a dense smoke for 2 or 3 min. They came in brilliant colours and in black. They could be set off on the ground or dropped from a plane to flame in air. Different signal requirements could be met by combining colours and, by prearranged code, friendly tanks or other units could make appropriate answers to signals from friendly aeroplanes.

Gyro.—A tank gyro stabilizer was developed to improve gunner's aiming chances. This device functioned satisfactorily while tank was driven at full speed across the battlefield.

Hangar.—A portable hangar was fabricated of cold, formed steel, with coverings and doors of specially treated dark canvas. In cold climates, wood sheathing was to be substituted for canvas. A portable, oil-fired, circulating air heating unit was also developed for heating this hangar.

Helmet.—The Chicago quartermaster depot was named as sole source of war department procurement for the new U.S. army M-1 steel helmet liner. This had three parts, (1) the steel shell fabricated and procured from special bullet and shrapnel resisting alloy steel, (2) a lightweight, rigid moulded plastic liner which is worn minus the steel shell in out-of-combat areas and (3) a head and neck band.

Hospital Train.—There was exhibited in Washington, D.C., during November, an all-steel, overseas type hospital train. It consisted of 10 cars, including 6 ward cars, a kitchen car, utilities car and two personnel cars for officers and enlisted men. Each car was slightly more than half the length of an ordinary railway car and was designed to negotiate the sharp curves, narrow bridges and tunnels of foreign railways. The train had a pressure ventilating system, complete sterilization units and operating areas in each ward car. It was used principally to remove patients from evacuation hospitals and the train was a complete unit in itself. The utilities car furnished electric current from two diesel generators, while two oil-fired steam boilers provided heat and hot water.

Each ward car could accommodate 16 bed patients.

Hydrosizing.—Shells for the 4.2" chemical mortar were body-sized by a new method. Instead of turning the shells on a lathe the sizing was done by hydraulic pressure. The time was reduced from 6 min. per shell by the old method to 30 sec. per shell by the new.

Material saved by hydrosizing amounts to 205 tons of metal on each 100,000 shells.

Inner Tubes.—Glenn L. Martin Co., aircraft manufacturer, announced the development of a new plastic which made better inner tubes than natural rubber. It had no resemblance to rubber but was, instead, a vinyl chloride plastic. It could be processed on standard rubber-working machinery and did not need to be vulcanized.

This substitute material was called Marvinol and its basic ingredients were coal, air, salt and water.

Jungle Kit.—In a 10-oz. waterproof kit, jungle aids were assembled for the soldier. The kit contained: a printed waterproof sheet of "Ten Rules for Jungle Safety," a pocket knife, a fish hook and line, a length of strong twine, a length of strong wire, a compass, a glass for starting a fire, iodine crystals in a waterproof container, matches in a waterproof container, and mosquito net for head covering.

Kitchen.—A kitchen railway car was designed to provide food for more than 250 persons at one sitting. It had two coal burning stoves, a huge sink, two water tanks, closets, large ice box and storage batteries for operating the lighting system.

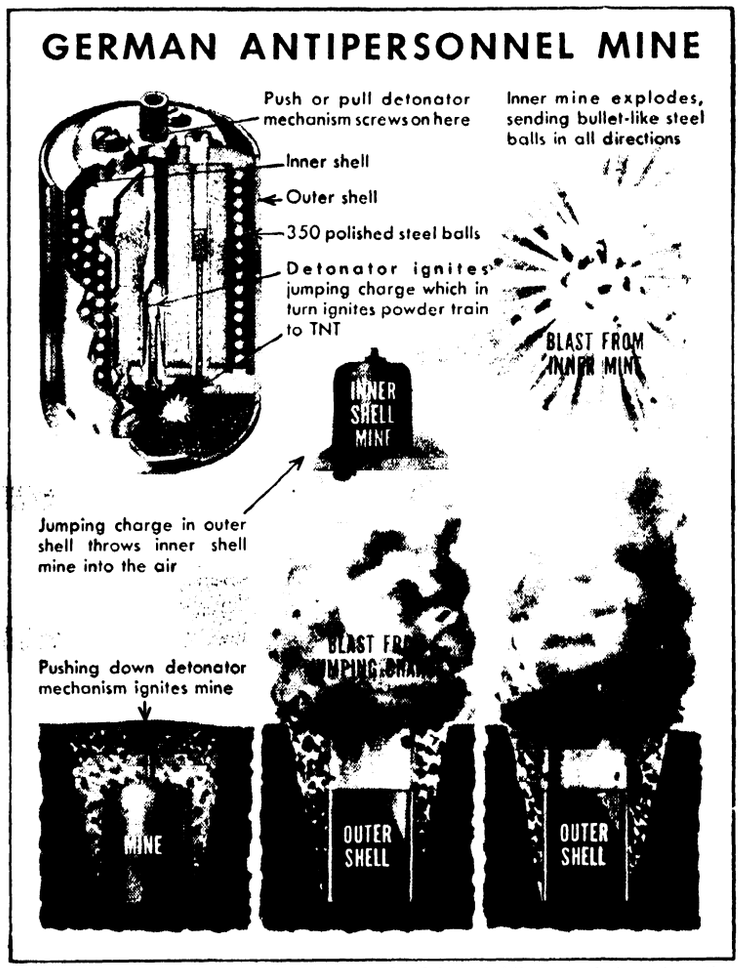
Knife.—A new trench knife resembling an oversized hunting knife was designed. It had a corrugated raw-hide handle. The blade was 6¾ in. long, one cutting edge running the full length of the blade, the other extending only 2¾ in., after which the steel widens for strength. A new leather sheath, provided with metal plates, protected the wearer from the cutting edge of the knife in case of a fall.

Leather.—Savings in this item were effected by long-range planning. By switching to an unlined horsehide riding glove and by altering the cuff design, a total of 1,028,000 sq. ft. of leather was saved. Through substitution of 3,399,377 sq. ft. of cattle hide splits, a total of 11,484,300 sq. ft. of horsehide splits and 153,125 sq. ft. of grain leather horsehides was saved in making heavy leather gloves. Height of uppers on soldiers' shoes was decreased to effect a saving of 9,871,088 sq. ft. of grain cattle hides. Incidentally, this change saved great lengths of shoelaces and, by the elimination of four eyelets on each shoe, made possible a saving of 282,032 lb. of steel. Shoulder strap hand bags carried by nurses and Wacs were made of arctic sealskin, a noncritical item and a means of saving 3,262,410 sq. ft. of cowhide. Another 1,100,295 lb. of strap leather was saved by replacing the all-leather machete sheath by one of water-repellent cotton duck. Canvas carbine covers saved 1,060,285 lb. of leather.

Lights.—A submarine searchlight was developed capable of withstanding immersion in cold water one minute after burning and likewise able to resist the shock of firing a heavy calibre gun only a few feet away from its mounting.

Since bodies of water absorb rather than reflect light, it was necessary to fashion floating lights to define water runway areas for safe landings on dark nights. Westinghouse technicians devised an intense, battery-operated fluorescent lamp mounted on a floating rubber doughnut.

Bicycle tail lights were attached during the year as a part of equipment for parachutes.



Lubricants and Fuel Oil.—By sharp rationing of crude oil and refined gasoline, particularly on the eastern seaboard of the United States, an estimated 500,000 bbl. of gasoline a day were saved. However, army demands made this still a very critical matter. Crude oil requirements were estimated at 4,150,000 bbl. a day, or about 130,000 bbl. more than could efficiently be produced.

The government's Automotive and Power branch tested a new synthetic lubricant with an operating range from minus 100° to plus 300° F.

Machine Guns.—In January and February of 1943, American shops produced 150,000 machine guns and 134,000 submachine guns as against 132,000 machine guns of all calibres in all of World War I.

A new submachine gun was put into mass production. It weighed less than 9 lb. and might be taken down in three principal pieces, none of which was over 1 ft. long. This gun, M-3, was so small it could be carried in an ordinary brief case. It was a .45-calibre weapon, all-metal construction with collapsible metal stock. Working parts were fully enclosed against dirt, water and mud. This gun was found exceptionally reliable in operation, even after immersion in sea water. It was capable of firing 450 rounds per minute, cost less than $20 to manufacture, and after firing 49,600 rounds in test showed no decrease in accuracy.

Mats.—Aladdin's magic carpet came to light in the widespread use of interlocking steel mats by means of which landing fields and take-off runways were built almost as if by magic. In the month of January, alone, more than 37,000,000 sq. ft. of metal landing mats were produced, and later in the year it was estimated that production of this item had increased 353% over the

output for the year 1942.

Microphone.—A tiny lip microphone was devised to be worn on the upper lip for use in tanks and other places where users of communications must have their hands free. This instrument fitted easily under gas masks and dust respirators.

Packaging.—Formerly, U.S. tanks shipped to British ports had to be de-slushed of heavy coats of grease which had been smeared on to prevent rust during the ocean voyage. While lying helpless at dockside throughout this process, they were easy targets for nazi bombers who took advantage of the targets afforded. In 1943, tanks were shipped wrapped in plastic film with a drying agent inside the wrapper. Arrived at port of debarkation, the wrapping was ripped off and the tank driven quickly away from the dock.

Pipelines.—Portable pipelines for military service were developed by the corps of engineers in co-operation with private industry. These lines solved the problems of bringing liquid fuels and water to front line troops, the latter especially valuable in arid regions. This new pipeline was nearly as portable as a tank truck. It could be laid at the rate of 20 mi. per day and it was movable to allow coverage of rapidly shifting battle fronts. One mile of the line, including pumping stations, weighed only 13 tons. The pipe sections could be laid on top of any terrain accessible to trucks.

Plastics.—The army tested plastics for temperature variations ranging from −55° to +85° C.

Powder.—A new process was evolved whereby wood pulp was used in the manufacture of smokeless powder. The development was undertaken by the Hercules Powder Co. because it was recognized that the U.S. cotton supply was inadequate. The new process was estimated to have saved $20,000,000 manufacturing costs in its first year of operation.

In addition to sulfanilamide tablets, U.S. soldiers carried a tin of powder a small amount of which would de-flea them. Along with this was a small vial of fumigator with which they could quickly delouse their clothing in sealed paper sacks.

Rifles.—Production of the Garand rifle was stepped up to the point of producing 80,000 of them a month.

Rubber.—The normal natural rubber consumption was estimated on an annual basis at 600,000 tons. The army's rubber conservation program reduced the use of crude rubber in war material by 45% on the basis of the amount of rubber in the same material as of Dec. 7, 1941. Eleven principles of conservation were established: designs; constructions and compounds; factory inspection of finished products; packaging; procurement; storage; issue; application; preventive maintenance; reconditioning and reclaiming and co-ordination. Polyvinyl resins replaced rubber for cable and electric wire insulation. Butyl was used to replace natural rubber for floats, boats, rafts and other inflatable items. Buna S replaced natural rubber in tires. In November the war department announced that, henceforth, all army rubber footwear would be manufactured from Buna S, saving about 180,000 lb. of natural rubber per month.

Searchlights.—This engineer item showed a 525% production increase for the year.

Shoes.—In January and February, 5,000,000 pairs of marching shoes were built for the military service. Early in the year, army shops were rebuilding 250,000 pairs of shoes per month and repairing another 525,000 pairs. For the year it was estimated that approximately 6,500,000 pairs were rebuilt, effecting a savings of $7,000,000 plus 20,000,000 sq.ft. of leather.

Shoe-pac.—A new type was designed with rubber feet and leather tops intended for use in snow or on wet terrain. It had a nonskid rubber heel, ridged for easy attachment of snow shoes.

Soap.—A new all-purpose soap was perfected by the army. It was mild, nonirritant and efficient under all conditions.

Spectacles.—A new type was devised for use with gas masks.

Statistics.—Certain statistics are of interest in connection with the production of munitions. Emergency construction, real estate and maintenance programs for the army of the United States represented an outlay of approximately $11,000,000,000 since beginning of these activities in June 1940. Nearly 15,000 separate projects were undertaken, including air bases, tactical air fields, schools and depots. Posts, camps and stations occupied a total area of approximately 14,500 sq.mi., or the combined area of Massachusetts, Rhode Island and Connecticut. The army built more than 480,000,000 sq.yd. of roads, airfield runways and parking spaces—the equivalent of 13 New York-to-Seattle highways each 21 ft. wide. The army also operated 3,340 mi. of railroad.

In September, percentage-of-increase figures were published showing the rise in production since Sept. 1939, viz.: petroleum 66%; soft coal 40%; chemicals 300%; iron ore 125%; hydroelectric power 79%; and steel 106%. The month of July 1943 was a turning point, since it showed for the first time in months an over-all increase in production of munitions—the gain stood at 3%.

Figures released in September showed actual output since May 1940 of: aeroplanes 123,000; tanks 53,000; trucks 1,233,000; and small arms 9,500,000.

For the manufacture of munitions, the small manufacturers of the country received 48.8 cents out of every procurement dollar spent by the army service forces, and an additional 25.2 cents of each dollar was received by small plants through "first-tier" subcontracts.

Steel.—One of the toughest problems in the history of military production was solved by the General Motors Corp. (Buick division) working with army ordnance experts. Demand for conservation of copper made mandatory the evolving of a process for the manufacture of steel shell cases. The four different processes which solved the problem involved extension and cold working of bar stock steel, drawing it into size and shape of an artillery shell case, giving it at the same time the high physical properties required in firing. It was hot-extruded and cold-drawn from a billet of steel 3⅛ in. in diameter by 1¾ in. deep, and perfect surface was secured by grinding. Inspection by magnaflux method checked all internal imperfections.

At the Fontana plant of Henry Kaiser in San Bernardino valley, Calif., was produced California's first "home-grown" steel, from ore to finished plate. In August the first sheared plate was made and fitted into the deck of a Kaiser Liberty ship.

Stereofluoroscope.—This was a newly developed instrument whereby a surgeon got a three-dimensional picture when he probed for bullets or shell splinters in a soldier's body. He was able to look at the embedded foreign matter and, by using a slim sterilized needle, reach to the fragment for removal purposes.

Stethoscope.—A new acoustic stethoscope introduced sounds to the doctor's ears never before heard in the human body. The device registered sounds of the human body ranging from 40 to 4,000 sound cycles.

Tanks.—During World War I, the United States produced a total of just 80 tanks; in a two-month period in 1943, production of tanks stood at 5,000.

Telephone.—A sound-powered telephone, operated without cumbersome batteries, proved to be one of the most useful pieces of equipment on Guadalcanal. Power in the telephone was generated by the human voice and was capable of a 5-mi. radius of transmission under almost any circumstances—10-mi. radius under favourable conditions. It was more compact and durable than battery-powered phones and combatted tropical humidity. Signalling was accomplished by whistling into the transmitter.

Trucks.—In January and February, more than 28,000 army trucks and, in February, 7,800 weapon-bearing combat vehicles were produced. A new product of the year was the "truck amphibian, 2½-ton, 6x6, DUKW-353." Promptly christened "the duck," it could carry both troops and cargo on sea as well as on land.

Turret.—A power turret was designed for aircraft. It was technically a gun mount, power-operated. This turret overcame the slipstream (air driven back by the propellers), thus enabling the gunner to hold a steady sight on his target. The steady aiming thereby afforded was called "tracking," and, coupled with American advanced sighting devices, made it almost impossible for the aircraft gunner to miss.

Uniforms.—Developments in this field were based on a "layering" principle by which successive layers of clothing might be donned to suit the climate. Basic fabric was a 9-oz. rip-proof material known as "5-harness" sateen. It was extremely tough and had excellent wind- and water-resisting characteristics. An army field jacket was made of this material, reversed side out, with a 5-oz. poplin lining. All buttons were covered with flaps to prevent catching on objects. For cold climates, warm pile-cloth was used, and for extremely cold areas, two suits were provided, worn, one with pile side of cloth in, the other with pile side out.

Tailored two-piece slack suits were prescribed for Army nurses on duty on hospital ships, hospital trains and in warmer climates overseas. This uniform provided greater freedom of movement than was possible with skirts and dresses and also afforded better protection from insects.

Walkie-talkie.—There was perfected a new series of radio communications set, light enough to hold in one hand and almost as easy to operate as a telephone handset. It was used with outstanding success in North African operations. Fitted with an improved superheterodyne, its range was triple that of old models. The set used miniature radio tubes and was known to function after being completely rain-soaked.

X-ray Machine.—Westinghouse engineers developed a new X-ray machine capable of inspecting as many as 17,000 aeroplane castings in a 24-hr. day. This unit produced an exposed film of six castings every 30 sec.

Certain definite army unfilled needs were brought out in the munitions field. Some of them were: a device to locate nonmetallic land mines; a harmless method of darkening aluminum so as not to reflect light; a method of waterproofing vehicles so that engines would not stall while fording streams; an inexpensive durable metal for soldiers' dishes; and a method of absorbing or eliminating poisonous carbon monoxide.

Navy.—Vessels of the U.S. navy completed in the three years between July 1940 and July 1943, when added to existing tonnage, made it the mightiest surface fleet in the world's history. Building for the three-year period included 333 combat vehicles, 1,274 mine craft and patrol craft, 151 auxiliaries, 654 yard and district craft and 12,964 landing craft. The degree of step-up in 1943 is shown in the figures for June, which showed that the number of vessels completed in that month approximated the total number finished in the entire first 18 mo. of the defense building program. During the first half of 1943, navy yards and private shipbuilders, including the record-making and breaking Henry Kaiser, built more than 6,000 naval craft of all classes. This was an increase of 250% over the number of vessels completed in the same period in 1942. Ships built cost approximately $2,500,000,000 and represented 1,000,000 standard displacement tons. Included in this construction group were the first vessels of a new combatant type, the destroyer escort. Production of PT boats was seven times that of the preceding year. Noted in construction work for the year was virtual completion of the reconstruction job on the vessels crippled at Pearl Harbor in 1941, along with the righting of the giant liner, the "Lafayette" (ex-"Normandie"). It was estimated that in 1943 the United States had afloat more than 5,000,000 tons and ships of all kinds were coming off the ways for the navy at the rate of five per day. Figures estimated for the fiscal year 1944 (ending June 30, 1944) showed a total vessel strength of 41,179 divided by types as 4,153 combatant, patrol, mine and auxiliary ships; 2,994 district and yard craft; and 34,032 small landing craft and special boats.

Big ship balance was restored by commissioning of the aeroplane carrier U.S.S. "Saratoga" and the launching on Dec. 7 of the 52,000-ton battleship "Wisconsin." A new class of carriers (CVB) 45,000-ton, inaugurated in 1942, saw two keels laid down in 1943 and a third planned for 1944. The "Saratoga," the biggest aeroplane carrier afloat was originally intended to be built as a battle cruiser. An interesting bit of historic construction during the year was the refitting, regunning and remanning of the former presidential yacht "Mayflower," which was put into service as a coast guard cutter on Oct. 19, 1943. For the British navy, the Bethlehem-Hingham shipyard at Hingham, Mass., completed a destroyer escort ship 25 days after its keel was laid.

Antiaircraft fire power on modern battleships was 100 times greater than it was three years ago. Of this type of ship armament, four gun-and-mount assemblies constituted 97% of the dollar value of all ship installations for antiaircraft fire:

20-mm. antiaircraft guns
40-mm. antiaircraft guns
3"/50 calibre double-purpose guns
5"/38 calibre double-purpose guns

Of the above, only one, the 5", was American designed.

Amphibious attacks on Sicily, Italy, Attu, Kiska, Rendova and Tarawa showed how well the navy was equipped with landing craft to meet army requirements. The several types of these craft were: LST—landing ship tank, really a medium-sized ocean freighter (372 ft. long; 5,500 tons), whose bows open up like huge jaws when discharging cargo; LCI-L—landing craft infantry-large, able to navigate by itself on high seas (155 ft. long) and can carry 200 infantrymen; LCV—landing craft vehicle and LCP—landing craft personnel, with space sufficient to carry 50 men or equivalent cargo to shore (36 ft. long); LCM—landing craft mechanized (50 ft. long), carries a medium tank and crew of four; LCT—landing craft tank (100 ft. long), designed to carry large tanks with their crews.

Navy chemists developed plastic shipbottom paint which materially reduced fouling, so much so that very appreciable savings in fuel oil were effected.

General utility, semicircular steel buildings were fabricated for navy use. They weighed complete 25,000 lb. each and could be packed for shipping in crates occupying only 369 cu. ft.

Waters off Cape Fear, N.C., witnessed the testing of many diverse types of life-saving equipment, all of which showed revolutionary advance in items provided to sustain life during long periods of time if cast adrift at sea.

In the realm of merchant ships, William Francis Gibbs, cooperating in a program of standardization to speed up mass production, reduced merchant ship types from 6 to 3; types of geared turbines from 27 to 8; and turbogenerators from 77 to 17. It was believed that future merchant ships would be powered with geared turbines giving them speeds of over 15 knots per hr. These Victory ships would supplant the Liberty ships and, with the same cargo-carrying capacity, would be able to outrun submerged submarines.

Salvage.—The importance of systematic salvage in relation to the munitions program was stressed by war department circular 399, Dec. 9, 1942, which stated in part that ". . . used ammunition components be recovered and turned in for salvage in best possible condition. . . ." Early in January, it was announced that the army had collected at overseas bases and returned to the United States approximately 1,348,000 lb. of brass cartridge cases. At overseas bases there were collected tires, tubes, scrap rubber, scrap metals, clothing and textiles. When received in the United States, repairable property was channeled into repair facilities while metal scrap was sent into channels of industry. There was a steady flow to the United States of 300 tons of battle scrap a month. This scrap was in addition to ferrous scrap which the navy was salvaging in shore installations at the rate of 25,000 tons a month. In the navy, items of salvage extended from pliofilm for aeroplane engine covers to antifreeze radiator liquids. Waste lumber was given for fuel to needy families; electric light bulbs were salvaged for brass; tin cans returned to tin and steel components; garbage was fed to piggeries; metal was salvaged from photo film rolls and typewriter ribbon spools; and scrap cordage was used in manufacturing tough fibre paper serving as a substitute for silk in small parachutes used for dropping aeroplane flares.

To encourage household savings of kitchen fats, the war department reprinted and distributed the DuPont Co. conversion scale showing that: 100 lb. of scrap fats and oils could be converted into more than 6 lb. of glycerine and, then, nearly 15 lb. of nitroglycerine. In turn, this would make enough dynamite to bring down 1,500 tons of soft coal or enough iron ore to provide steel to make 2,000 100-lb. bombs. Murphy, Robert Daniel (1894–), U.S. foreign service official, was born Oct. 28 in Milwaukee. He entered the foreign service in 1917 as a clerk in the Berne legation and held consular posts in Zurich, Munich and Seville until 1930, when he was transferred to the Paris embassy as consul and later first secretary. After the collapse of French armies in June 1940, he followed the Pétain government to Vichy, there becoming a counsellor in the U.S. embassy and chief U.S. representative in French North Africa. Murphy was credited with having played an important role in preparing the groundwork for the U.S. invasion of French North Africa in Nov. 1942. For this work he was given the D.S.M. and was raised to the rank of minister. During the early part of 1943, under a storm of criticism from the U.S., Murphy worked toward a settlement of Giraud-de Gaulle differences, his goal being French unity and the establishment of a governing body that the U.S. would be willing to recognize. Finally, the French Committee of National Liberation was set up, and conditional recognition by the U.S. was achieved Aug. 26. When the advisory council to the Allied Control Commission for Italy was formed in November to replace the Allied Mediterranean commission, Murphy was appointed as the U.S. member with the personal rank of ambassador. His duties as American representative to the French Committee for National Liberation were taken over by Edwin C. Wilson, former ambassador to Panamá.

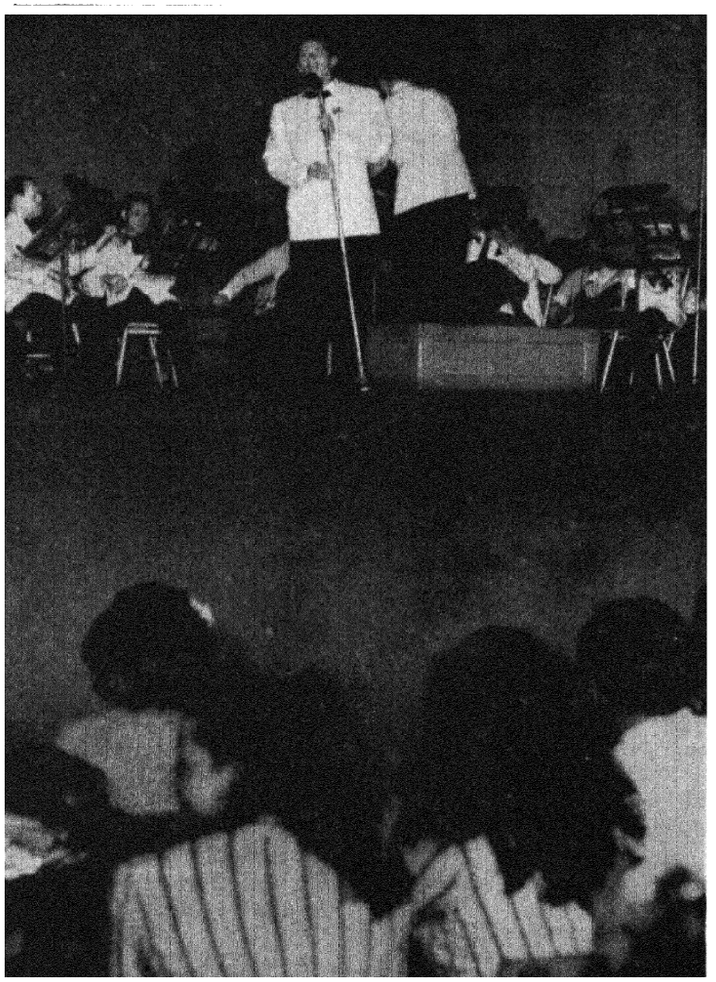
Murray, Philip (1886–), U.S. labour leader. A native of Scotland, he was born in Blantyre May 25 and emigrated to the United States in 1902. Naturalized in 1911, he became a member of the international board of the United Mine Workers of America the next year, president of the union's fifth district in 1916, and international vice-president in 1920. During World War I he was a member of Pennsylvania's regional war labour board and served also on the National Bituminous Coal Production committee. In 1935 he was named to the National Industrial Recovery board and to the advisory council of the National Recovery administration. Murray, choice of John L. Lewis, succeeded him as C.I.O. president, Nov. 22, 1940, when Lewis fulfilled his pledge to quit if Roosevelt were re-elected. But Murray did not follow Lewis in his bitter opposition to Roosevelt's foreign policy. A split developed, which became an open break in May 1942, when Lewis ousted Murray as U.M.W.A. vice-president. Murray fought back, and the C.I.O. went along with him; Lewis and the Mine Workers walked out. In 1942, Murray proposed industry councils in which labour, management and government would be equally represented. While this plan was not adopted, WPB did sponsor labour-management committees throughout the nation's war plants. In 1943 Murray fought actively for various things: to maintain the no-strike policy, to use manpower more efficiently, to streamline the War Labor board, to stabilize prices, etc. When congress refused to go along, and instead enacted the Smith-Connally anti-strike bill and was hesitant about taxes and subsidies, the C.I.O. set up a political action committee, with $750,000 funds, to aid the candidate it supports in the 1944 presidential election. In his Labor day address, Murray asked that labour be given greater voice in determining national policies. Late in 1943, he was emphatic in his demands that, since taxes and subsidies adequate to stabilize prices had not been provided, the "little steel formula" should be scrapped and wages permitted to rise. Murray was re-elected president of C.I.O. on Nov. 5.



Museums of Art: *see* ART GALLERIES AND ART MUSEUMS.

Music. In 1943 most musicians came to realize that the aesthetics of 10 and 20 years before would not suffice for the new world ahead.

Certainly, the tenets of "pure art" were already under attack. The effects of this attack were to be seen in the music from Russia. Sergei Prokofiev, the composer of the *Classical Symphony* and of much performed violin and piano concerti was composing an opera on Tolstoy's *War and Peace.* He produced a cantata—*Ballad of the Unknown Boy* and a *Symphonic Suite, 1941.* Vissarion Shebalin wrote a *Slavonic Quartet* and a *Russian Overture.* Reinhold Glière completed not only a *Concerto* for coloratura soprano with orchestral accompaniment, but also a popular vocal number, *End of Hitler.* Nyoskovsky's *Kirov Is With Us* is a cantata based on the Leningrad siege. Dmitri Shostakovich sold to an orchestra in the United States for $10,000 the first performance rights to his new *Eighth Symphony,* which, like the seventh, is based directly on the great Russian offensive in the war. The fact that the "International," the song of world-wide revolution, was abandoned by the U.S.S.R. in 1943 for a nationally contained anthem, might in some way serve to mark the change that was taking place.

Aaron Copland wrote his *Lincoln Portrait,* though perhaps his *Piano Sonata,* given its first performances during 1943, remained his most provocative new work. A new *Sonata for Violin and Piano* was heard in January of 1944. Daniel Gregory Mason produced *A Lincoln Symphony.* Robert Palmer set Vachel Lindsay's *Abraham Lincoln Walks at Midnight.* Lincoln and Jefferson served Earl Robinson with material for radio cantatas. "Songs can be bullets," said Robinson. Four choruses for men's voices by Randall Thompson setting writings of Thomas Jefferson were performed at the 200th anniversary of his birth. William Schuman, winner of the newly formed Pulitzer prize (no longer a scholarship for study but a prize for the best work of the year), produced *Prayer—1943* and *A Free Song,* a cantata on words by Walt Whitman. William Grant Still, whose *In Memoriam of Colored Soldiers Who Died for Democracy* the New York Philharmonic Symphony Orchestra was to perform, made a setting of an anti-fascist poem by Katherine Garrison Chapin, *Plain Song for America.* Ross Lee Finney wrote a *Symphony Communiqué* and *Pole Star for This Year,* a setting of a poem by Archibald Mac Leish. Paul Creston, whose *First Symphony* won the New York Music Critics' award for the finest orchestral work by an American composer having its New York *première* during the season, composed *Chant of 1942.* Roy Harris in his program notes for his *Fifth Symphony,* given first performance by Sergei Koussevitzky and the Boston Symphony Orchestra and dedicated to the Russian army, showed the composer's desire "to express qualities of our people . . heroic strength, determination, will to struggle, faith in our destiny."

FRANK SINATRA, popular radio singer of 1943, singing with the New York Philharmonic at Lewisohn stadium, New York city, Aug. 3

It must not be supposed, however, that such works give the complete picture for 1943. Many composers, just as moved by the events of the times, completed works which revealed no outward indication of these events. A *Duo for Violin and Piano* by Roger Sessions had its first performance. Frederick Jacobi completed a three-act opera *The Prodigal Son* based on four early American prints. His *Ode* for orchestra was presented in 1943 by the San Francisco and the Boston Symphony Orchestras. David Diamond completed a *Second Symphony.* Howard Hanson's *Fourth Symphony* was given a New Year's broadcast. A *Second Symphony* was completed by John Verral. One can enumerate concerti, symphonies, quartets and various other forms that show the continuing interest of the composer in objective musical organization.

The music of South and Central America perhaps inevitably was less influenced by changing times. That the work of 1943 seemed less different from the work of ten years before might be due to several causes. For one thing, national feeling marked South American music very strongly; the music of Mexico in particular was deeply concerned with the mass audience. Then also, perhaps, the effects of the conflict were less strong and less immediate there than elsewhere. In Mexico new symphonies by Edward Hernandez Mancada and Condelario Huizar and new piano concerti by Blas Galindo and Jesé Rolon were presented. Creative activity was vigorous also in Chile, Brazil and Argentina.

European composers living in the Americas were active. A *Second Symphony,* a *Piano Quartet* and a *Suite Concertante* attracted attention to the works of Bohuslav Martinu. A new symphony by Darius Milhaud was presented by the NBC Symphony Orchestra. This composer was working on a new opera *Bolivar.* Ernst Krenek wrote a series of choral works to Latin texts. Karol Rathaus was working on a *Third Symphony.* Igor Stravinsky's *Dances Concertantes* was given its *première* at the Museum of Modern Art in New York city.

There was little to review in the musical life of continental Europe in 1943. **(R. L. Fy.)**

Popular Music.—The year 1943 was on the whole more encouraging than discouraging in the field of popular music. Its chief discouragement was the ban on recordings and transcriptions issued by James Caesar Petrillo, who said that this action had thus far cost the members of his union over $7,000,000 in fees.

A fair amount of popular music managed to get on records nevertheless, the popular Frank Sinatra making some with choral accompaniment, with Decca finally capitulating to the Petrillo demands and thus getting the jump on the other record manufac-

turers. The immediate effect of the record shortage was seen in the revival of old hits and a new emphasis on the music of motion pictures and stage productions.

Richard Rodgers and Oscar Hammerstein II were the heroes of the year on the creative side of popular music. The enormous success of the Theatre guild's musical play, *Oklahoma!,* for which these two men were chiefly responsible, brought a new dignity and prestige to a business that sadly needed both, and almost eliminated the old dividing line between "popular" and "classical" music. Hammerstein provided an additional sensation with his up-to-date adaptation of Bizet's *Carmen* under the title of *Carmen Jones,* produced by Billy Rose with an all-Negro cast.

The best popular song of the year was unquestionably the Rodgers-Hammerstein "People Will Say We're in Love," from *Oklahoma!* That the public appreciated its merits was proved by a record of 25 appearances in the Hit Parade, three times at the top, seven times in second place and three times in third, with every evidence of continued popularity for 1944. Toward the close of the year, this outstanding hit was actually passed by the earthy waltz song, "Oh, What a Beautiful Morning," from *Oklahoma!* while other numbers from the same opera had a more than average success.

A motion picture tune, "You'll Never Know," was in the Hit Parade 24 times, with nine appearances at the top of the list. "As Time Goes By," achieving new life through the film *Casablanca,* made 21 appearances in radio's Hall of Fame, four times at the top. Other frequent visitors to this established sanctum of popular music were the Disney good neighbour ditty, "Brazil," the air-minded "Comin' in on a Wing and a Prayer," "It Can't Be Wrong," "Sunday, Monday or Always," "There are Such Things," "Taking a Chance on Love" (featured in both the play and the motion picture, *Cabin in the Sky,* by Vernon Duke), Cole Porter's "You'd Be So Nice to Come Home To," and the frankly nonsensical "Pistol-Packin' Mama," which might be called the novelty song of 1943.

It is highly probable that the biggest seller of sheet music and records was Bob Miller's hillbilly patriotic number, "There's a Star Spangled Banner Waving Somewhere," which had already made an amazing record in 1942 and still commanded a circulation of which the connoisseurs seemed utterly unaware. Its complete absence from the Hit Parade was a mystery.

The films succeeded in reviving such good old-timers as "For Me and My Gal" (with the help of Judy Garland) and "Put Your Arms Around Me, Honey," while the 25-year-old "Paper Doll" surprised even its publishers with a new and active life.

Other hit songs of 1943 were "Moonlight Becomes You," "I Had the Craziest Dream," "I've Heard That Song Before," "That Old Black Magic," "Don't Get Around Much Any More," "Let's Get Lost," "All or Nothing at All" and "In the Blue of Evening." Irving Berlin's "White Christmas" maintained its popularity into the new year and came back strongly for the holiday season of 1943–44. Arthur Schwartz added his bit toward a definitely higher standard with the witty "They're Either Too Young or Too Old," introduced, strangely enough, by Bette Davis on the screen, and showing a real popularity by the end of the year. (S. Sp.)

A poll conducted by the musicians' publication *Down Beat* among swing-band musicians to determine their favourite male singer of 1943 had the following results: Frank Sinatra, 4,992; Bing Crosby, 3,942; Bob Eberly, 1,197. Benny Goodman was voted "king of swing" as the outstanding swing-band leader of the year. (*See* also Performing Right Societies; Radio.)

YEHUDI MENUHIN and the London Philharmonic orchestra gave a special concert for 5,000 U.S. soldiers and guests at Albert Hall, London, in March 1943

Music Library Association. The Music Library association was organized in 1931, with promotion of the establishment, growth and use of music libraries and collections of music as its primary objective. Membership in 1943 included some 200 individuals and 100 institutions throughout the U.S. and Canada. Edward N. Waters, Library of Congress, was president for 1943. The work of the organization is carried on by its executive board, consisting of the president, vice-president, secretary-treasurer and two members-at-large; by regional chapter chairmen and by various committees, among which are publications, inter-library relations, inter-American library relations, photoduplication, personnel and employment, and periodical indexing. In normal times an annual mid-winter meeting is held, devoted to reports, elections and discussions. A summer meeting is held in conjunction with the annual conference of the American Library association.

Publications include the association's quarterly periodical, *Notes; Music and Libraries,* a volume of selected papers presented at the 1942 meetings; a *Code for Cataloging Music,* comprising five chapters and a supplement on cataloguing phonograph records.

Important bibliographical work for the U.S. army included lists of both music and books for camp libraries, the latter list mimeographed and distributed by the war department.

The M.L.A. is affiliated with the American Library association, and a member of the National Music council and the Council of National Library associations. (C. V. N.)

Mussolini, Benito (1883–), Italian statesman and dictator. For his earlier career, see *Encyclopædia Britannica.* Il Duce chose June 10, 1940, as the pro-

"A BUST." This cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.) appeared after the fall of Tripoli, Jan. 23, 1943

pitious date for entering World War II, doing so with the declaration that "our conscience is entirely clear." After a few desultory thrusts at defeated France he consulted with Hitler at Munich June 18 on the terms of peace. Italian military activities then remained in relative abeyance until the beginning of the campaigns in North Africa (Sept. 12, 1940) and in Greece (Oct. 28). Both these operations were soon thrown into reverse, and on Dec. 6, 1940, Mussolini reorganized his military command.

The later events of Mussolini's career fell into a general pattern: conferences with Hitler; shake-ups of the army; explanations of defeats; and threats against the common enemies of the axis. In June 1941, he joined Hitler in declaring war on Russia and in the same month boasted that U.S. intervention would not alter the outcome of the war.

During 1943, Mussolini's prestige and popularity among the Italian people dwindled to the vanishing point. Flagging Italian morale alarmed even Hitler, and on July 19, 1943, the fuehrer conferred with the duce at Verona. It was the 14th and perhaps the most crucial meeting between the two dictators. Mussolini presumably intimated that he was losing his grip on his countrymen. Six days later, on July 25, Mussolini was ousted from the office he had held for 20 years, after a stormy meeting with his cabinet and King Victor Emmanuel III. Marshal Pietro Badoglio, who had succeeded to the post of premier, had the ex-duce incarcerated, but a few days after the Allied invasion of Italy, German paratroopers staged a bold raid on the prison, liberated Mussolini and took him back safely to axis territory. On Sept. 23, 1943, he formed a new "Republican fascist" government under German protection and exhorted Italian people to rally to his cause. (*See* also FASCISM; ITALY.)

Mustard Seed: *see* SPICES.

Muti, Ettore (1902–1943), Italian air officer and politician, was born May 22. He volunteered in the Italian army during World War I, fought with D'Annunzio's troops at Fiume and returned home a bemedalled hero. Muti joined the fascist ranks before the march on Rome and was known as the "strong-arm" leader of Mussolini's palace guard, although nominally he was ranked as a minor fascist official. He served as lieutenant colonel in the Ethiopian campaign, participated in the Spanish civil war and the Italian campaigns in Albania and Greece, becoming one of Italy's most decorated air heroes. Muti's "devotion" to the fascist party and his ruthless personality were recognized in 1937 when Mussolini named him secretary general of the fascist party. When Il Duce resigned in July 1943, it was reported that Muti fled to escape the wrath of his anti-fascist victims. His death was announced by an Italian news agency, Aug. 24.

Nagano, Osami (1880–), Japanese naval officer, was born in June at Kochi, Japan. After graduating from the naval academy in 1900, he attended the naval staff college. In 1913, he was a language officer in the U.S., where he studied law at Harvard university and took courses at the War college. As naval attaché in Washington, 1920–23, he participated in the Washington naval conference of 1921–22. In 1928, he commanded a Japanese naval training squadron which visited Annapolis and was received by President Hoover. Known for his shrewd diplomacy, he represented his government at a number of international conferences. He attended the Geneva conference in 1932 and proposed elimination of aircraft carriers and long-range submarines, as well as restriction of the number of capital ships. At the London naval conference, 1935–36, Nagano sealed the doom of the 5-5-3 ratio. He rejected President Roosevelt's proposal of a 20% reduction, and when his demands for Japanese parity were refused, he led the Japanese delegation from the conference. Nagano was appointed minister of the navy in the Hirota cabinet, 1936. He apologized for the sinking of the U.S. gunboat "Panay" in 1937, insisting it had been an "accident." He became chief of the Japanese naval general staff, April 19, 1941.

Narcotics: *see* DRUGS AND DRUG TRAFFIC.

Nash, Patrick A. (1863–1943), U.S. politician, was born in Chicago, and made his fortune as contractor in the sewer building business established by his father. He was Democratic ward committeeman of the 14th (later the 28th) ward and its "boss" for over 40 years. He was appointed to the Board of Assessors in 1915 and elected to the Board of Review in 1918, but was defeated for reelection to the latter post in 1924. When the assassination of Anton Cermak left Chicago mayorless in 1933, Nash was instrumental in winning the vacant post for his close friend and hand-picked candidate, Edward J. Kelly. The two formed a political partnership, the nationally known "Kelly-Nash machine," which flourished for the next 10 years. Nash died in Chicago, Oct. 6.

National Academy of Sciences. A body of scientists incorporated by act of congress approved by President Lincoln in 1863 for the purpose of investigating and reporting upon scientific subjects whenever called upon to do so by any department of the United States government, with the proviso that the academy shall receive no compensation for services to the government but may be reimbursed for the actual expenses incurred in making such investigations and reports. Membership in the academy is limited

to 450 active members, who must be citizens of the United States, and 50 foreign associates. Names voted upon in the election of new members are nominated by the section covering the branch of research in which the individual is working, upon a two-thirds vote of that section. There are no applications for membership, as the proposed names originate upon suggestion by the existing membership. In 1943 the academy was engaged to a large extent on government problems concerned with scientific matters related to the war. These reports were confidential and were not published by the academy.

The academy meets twice a year. The annual meeting is held in Washington on the fourth Monday of April, and the autumn meeting is generally held in the east and west in alternate years. For the duration of the war, both meetings are held in Washington and are confined to business sessions for members only. Upon cessation of the war, scientific sessions to which the public is invited were expected to be resumed.

From the income of a number of trust funds given to the academy for that specific purpose, the academy awards medals in recognition of outstanding scientific research, or grants small sums of money to worthy investigators to enable completion of scientific research projects in special fields, according to the terms stipulated by the donors of these funds. At the 1943 annual meeting the following medals were presented: Henry Draper medal for 1943 to Ira Sprague Bowen; Agassiz medal for 1942, with accompanying honorarium of $300, to Columbus O'Donnell Iselin, II; Daniel Giraud Elliot medals, with accompanying honoraria of $200, for 1935 to Edwin H. Colbert, for 1936 to Robert Cushman Murphy; John J. Carty medal and accompanying award, $4,000, to Edwin Grant Conklin.

Twenty-six new members were elected at the 1943 annual meeting: Leason Herberling Adams, Abraham Adrian Albert, Jesse Wakefield Beams, Arthur Francis Buddington, Leonard Carmichael, William Henry Chandler, Edwin Joseph Cohn, John Nathaniel Couch, Theodosius Dobzhansky, Lee Alvin DuBridge, Leslie Clarence Dunn, Wallace Osgood Fenn, Paul Darwin Foote, Louis Plack Hammett, William Vermillon Houston, Walter Pearson Kelley, Warfield Theobald Longcope, Eli Kennerly Marshall, Jr., Leonor Michaelis, William Albert Noyes, Jr., Oswald Hope Robertson, Carl-Gustaf Arvid Rossby, Calvin Perry Stone, Charles Vincent Taylor, Hubert Bradford Vickery and Vladimir Kosma Zworykin. Six new foreign associates were elected at the same time: Alfonso Caso, Mexico; Sir Harold Spencer Jones, England; Richard Vynne Southwell, England; Charles Edward Spearman, England; Sir D'Arcy Wentworth Thompson, Scotland; Hendrik Johannes van der Bijl, South Africa.

The academy publishes an annual report, scientific memoirs, biographical memoirs of deceased members and monthly proceedings devoted to condensed reports of recent scientific discoveries. The academy building, 2101 Constitution ave., Washington, is closed to the public for the duration of the war.

National Association of Manufacturers.

The National Association of Manufacturers, an organization of individuals, firms and corporations engaged in manufacturing, was founded in 1895 with the following general objectives: (1) the promotion of the industrial interests of the United States; (2) the fostering of the domestic and foreign commerce of the United States; (3) the betterment of relations between employers and their employees; (4) the protection of the individual liberty and rights of employer and employee; (5) the dissemination of information among the public with respect to the principles of individual liberty and ownership of property; (6) the support of legislation in furtherance of those principles and opposition to legislation in derogation thereof. Membership, 10,000. President: Robert M. Gaylord, president of Ingersoll Milling Machine company; chairman of the board, F. C. Crawford; chairman of the executive committee: William P. Witherow; executive vice-president: Walter B. Weisenburger; secretary: Noel Sargent; treasurer: Theodore G. Montague.

Headquarters: 14 West 49th street, New York city. Branch offices: Investment building, Washington, D.C.; 111 Sutter street, San Francisco, California.

The N.A.M. also established the Economic Principles commission which was making intensive studies and analyses of the nature, operations, achievements and problems of the free enterprise system, and was in 1943 under the chairmanship of Robert R. Wason. Another important activity was headed up by the Better America program which was organized in 1943 to reduce the association's basic thinking and its constructive recommendations on long-range governmental policies to a series of visual presentations which could be used to crystallize industrial opinion, and which industrialists in turn could use to give congressmen and other government officials an impressive picture of industrial thinking. It was in 1943 under the chairmanship of H. W. Prentis, Jr.

Operating as an affiliated part of the National Association of Manufacturers, the National Industrial council included some 300 industrial associations of three categories: State associations, Manufacturing Trade associations, and Industrial Relations associations. The council provided an effective industrial contact with collective manufacturing membership in each section of the country.

(N. S.)

National Association of State Libraries.

The National Association of State Libraries is one of the oldest library associations in America. It was organized at a meeting in St. Louis in 1899 and elected as its first president, Melville Dewey, the author and inventor of the Dewey Decimal System of Library Classification. In the intervening years annual meetings have been held in various parts of the country, and almost every state in the union has had representation in the list of officers.

Forty-two state libraries throughout the country comprise the institutional members. There are in addition a limited number of associate and individual members whose interests are allied with state library work. Although state libraries are not all alike they do have many similar activities which makes an interchange of service and an exchange of publications particularly desirable. This is particularly true in the fields of legislative research and public documents. As the result of working together, it is now possible for each state library to secure from every other state whatever state publications are required.

In order to help in the cataloguing of these publications the association has in recent years published a series of check lists of session laws, statutes and legislative journals. These are kept up to date by the issuance of supplements as they are required. In 1943 a supplement was issued to the Check List of Legislative Journals and in the previous year a supplement was issued to the Check List of Session Laws.

In conjunction with the American Library association the state libraries were co-operating with the national libraries of Central and South American countries in order that they might be provided with such state publications as were needed.

The National Association of State Libraries is a member of the Council of National Library associations and participates in

the work of collecting large numbers of scientific and research publications, which after the war will be distributed to devastated libraries in Europe, Asia and Africa.

The annual meetings of the association were cancelled for the duration. In 1943 the officers were: president, Dennis A. Dooley, state librarian of Massachusetts; first vice president, Alfred Decker Keator, director, State Library of Pennsylvania; second vice president, Mrs. Virginia G. Moody, state librarian of South Carolina; secretary-treasurer, Mrs. Gladys F. Riley, former state librarian of Wyoming; executive committee, the officers named above and the most recent past president, Miss Helene H. Rogers, assistant state librarian of Illinois. (D. A. Dy.)

National Debt.

The national debt of a country generally refers to the total financial obligations of the state arising out of the issuance of public securities. It does not include the debt of all governmental units and agencies but only the obligations of the central government. The national debt usually indicates the extent to which the central government has resorted to borrowing over the years to make up the deficit between its outlays for government services and investment and its revenues from taxation and various minor sources. As the manner of keeping official accounts varies from country to country, however, there are many exceptions to this definition. On the one hand, agencies or corporations of the central government are sometimes set up outside the budget so that their debt does not appear in the national debt. On the other hand, obligations are sometimes assumed by the government and included in the official national debt statistics which did not originate in a borrowing operation. The adjusted service bonds issued to veterans are an example of this type of obligation included in the national debt total of the United States.

The course of the national debt in the United States from 1913 to 1944 is shown in Table I. The debt first reached substantial proportions during World War I, with a peak of over $25,000,000,000 at the end of the fiscal year 1919. During the following decade, about one-third of the debt was liquidated. With the onset of the world-wide depression in 1929 and the subsequent use of government expenditures as a method of fighting economic depression, the debt expanded rapidly throughout the 1930s to reach almost $43,000,000,000 at the end of the fiscal year 1940.

With the sharp rise in government expenditures which attended the rearmament program begun in the middle of 1940, the history

of the United States debt entered a new period. New tax measures increased government revenues substantially, but the scale of armament expenditures was so large that the national debt rose approximately $15,000,000,000 by the end of the calendar year 1941.

This was just a foretaste of what came after the nation's actual entry into the armed conflict. Vigorous steps were immediately taken to mobilize the entire economic structure of the country for the greatest war production program in all history. While tax revenues increased substantially in both 1942 and 1943, they could not keep pace with the flood of expenditures which the war effort required. As a consequence the national debt rose approximately $50,000,000,000 in 1942 and almost $58,000,000,000 in 1943. At the end of 1943 the debt was $165,877,278,992 and it was expected to reach $197,000,000,000 by June 1944.

Late in 1942 the treasury began the policy of raising the bulk of its required financing in short war loan drives, during the first of which total securities of almost $13,000,000,000 were sold. In 1943 two war loan drives were conducted, the first in April and the second in September, which yielded a total of $37,500,000,000. The September drive differed in one important respect from the two previous drives in that it was confined to non-banking investors. Despite this fact, the treasury sold almost $19,000,000,000 of securities, about the same total as in the April drive during which more than $5,000,000,000 of the sales were accounted for by commercial banks. Since the policy of the government was to secure as much of its financing as possible from individuals in order to minimize the inflationary effect of the huge government deficit, the sales of securities to individuals were stepped up considerably with each succeeding war loan drive. (*See* also WAR BONDS.)

One of the main features of the treasury's policy of securing non-inflationary sources of funds was the emphasis placed upon the sale of war bonds and stamps to individuals. In 1943 the amount of savings bonds outstanding rose from $15,050,000,000 at the beginning of the year to $27,363,000,000 at the end of the year. This constituted a sizeable increase in net sales to approximately $1,000,000,000 savings bonds per month in 1943 from $750,000,000 in 1942. In the course of the year there was, however, a disturbing increase in the rate of redemptions on these bonds. It was to be expected, of course, that redemptions would increase as the amount outstanding increased. However, they rose more than proportionately to outstandings. As compared with redemptions in the closing months of 1942 of about $4.50 out of every $1,000 outstanding, the monthly rate of redemptions in the latter part of 1943 was about $9.50 for every $1,000 outstanding.

An important factor behind the increase in savings bonds sales was the fairly widespread adoption of the payroll deduction plan which was sponsored by the treasury. The savings bonds purchased in 1943 by means of regular deduction from payrolls accounted for a large proportion of total sales in that year. Toward the end of the year about 27,000,000 employees were participating in the program and having $450,000,000 or 9% of their pay deducted each month for the purchase of war bonds. At the end of the preceding year there were only 20,000,000 employees participating in the program and the average deduction amounted to only 7%.

The maintenance of a low interest rate policy by the treasury was one of the outstanding developments in the financing of the public debt during the war. Up through the end of 1943 the war was being financed at an average rate of interest of slightly less than 1.75% on the securities issued compared with an average rate of about 4.25% on the securities issued to finance World War I. Interest rates during the war period rose only moderately above the level prevailing during the depression of the '30s, the highest rate for long-term market issues being 2.5%. As a special inducement to individuals to increase their savings and thus assist in the government's anti-inflation program, the interest rate on savings bonds if held to maturity was fixed at 2.9%.

For securities outstanding in the fiscal year 1943 the computed annual rate of interest amounted to 1.98% compared with 2.29% in the fiscal year 1942. As may be seen in Table II, the major factor in this decline was the proportionate rise in certificates of indebtedness and notes outstanding. Although these securities carried a low interest rate, they were a popular outlet, because of their high degree of liquidity, for business funds being built up during the war. This development meant, of course, that a substantial amount of refinancing would have to be done after the war.

Despite the decline in the rate of interest on outstanding securities, actual interest on the public debt rose substantially in 1943 because of the large rise in the total debt. From a figure of $1,452,000,000 in 1942, interest on the public debt rose to $2,191,000,000 in 1943.

State and Local Government Debt.—The figures on the debt of state and local governments, 1929–43, are shown in Table III. Because of the many government subdivisions in the United States and the many functions of government remaining in the hands of local government units, the state and local government debt has always been an important component of total government debt. It arose largely from the financing of the various types of public works, although during the period of declining economic activity from 1929–33 the falling-off of revenues and increasing expenditures for relief added to the debt total. From 1933 on state and local debt varied little, as the federal government took over the major burden of relief and also financed much of the public works of state and local governments. After 1940 state and local debt declined as revenues increased with the rising tide of national income and as scarcity of materials placed severe restrictions on public works expenditures. This trend was continued in 1943.

†Egyptian pounds.

While the reduction of state and local debt during the war years was not as large as the potentialities of the situation could have made possible, the financial situation of these government units was somewhat improved toward meeting postwar problems.

Other Countries.—Latest figures available for the national debt of leading countries are given in Table IV. That throughout history war has been the primary cause of the growth of national debts was borne out by the advance in debts during World War II. The debt of all belligerent countries, of course, rose precipitously and even some of the neutral countries had to increase government expenditures to an extent that made borrowing necessary. By and large, the one area of the world not subject to rising national debt totals during the war period was Latin America.

For the belligerent countries the national debt rose, because of the large scale of military operations, higher than in any previous war. The debt of the United Kingdom, for example, rose from £8,301,100,000 in 1939 to £19,103,000,000 at the end of 1943. Over this same period the national debt of Canada increased from $3,638,300,000 to $7,893,400,000, while in Australia the national debt of £A1,295,000,000 increased to £A2,164,969,307 by the end of June 1943.

Some conception of the financial drain of the war upon the occupied countries may be gained from the case of France, where the national debt advanced from 352,210,000,000 francs in 1939 to 1,231,522,000,000 francs in 1943. For most of the occupied countries, however, no reliable statistics on the public debt have been available in recent years.

The national debts of the axis powers were not, in 1943, known as accurately as those of the Allied nations, since the reported debt figures were not complete. In the case of Germany the official national debt rose from r.m. 30,737,000,000 in 1939 to r.m. 260,000,000,000 at the end of 1943. It was unofficially estimated, however, that the total German public debt had reached about r.m. 400,000,000,000 by that time. In Italy no official figures had been issued since 1935, but it was unofficially estimated that the debt in 1943 was 415,000,000,000 lire compared with 108,636,600,000 lire at the time of the official release. (*See* also BUDGET, NATIONAL; GREAT BRITAIN; NATIONAL INCOME AND NATIONAL PRODUCT; TAXATION.) (M. GT.)

National Education Association

of the United States moved forward during 1943 into an enlarged program to meet the educational problems resulting from wartime conditions. It conducted a campaign to raise a $600,000,000 emergency war and peace fund—one-third for the various state education associations, two-thirds for the N.E.A. to strengthen its work on behalf of the war and the peace. The Educational Policies commission distributed widely a number of important publications, including *Education and the People's Peace*. The campaign for federal aid to keep the schools open and to equalize educational opportunity as embodied in Senate Bill 637 was intensified as it became apparent that more than 100,000 teachers left the schools after Pearl Harbor. "Victory through Education" was the theme of American Education week, Nov. 7–13, 1943.

Because of the wartime need for conserving travel facilities the association's winter convention scheduled to be held in St. Louis was canceled and the summer convention gave way to a business meeting of the Representative assembly at Indianapolis, June 27–29.

The association was organized in Philadelphia in 1857. It had, in 1943, a membership of 219,334 and its affiliated state associations had a membership of 753,082. The official organ is *The Journal of The N.E.A.*, edited by Joy Elmer Morgan, and issued to all members monthly except June, July and August. The president for 1943–44 was Mrs. Edith B. Joynes, principal of the Robert Gatewood Elementary school, Norfolk, Virginia; executive secretary, Willard E. Givens. (*See* also EDUCATION.)

National Geographic Society.

Organized in 1888 by a small group of professional geographers resident in Washington, D. C., this society's purpose was set forth in its charter as that of "increasing and diffusing geographical knowledge." Gilbert Grosvenor, the president in 1943, assumed the direction of the organization's activities in 1899 and broadened the scope of its researches to appeal to the layman interested in scientific accomplishments. The membership of the society, which was less than 1,000 in 1899, was 1,200,000 in 1943.

As one method for carrying out the purpose for which it was established, the society issues monthly its official publication, the illustrated *National Geographic Magazine*. During the 55 years of its existence, the society has sent numerous expeditions to various parts of the earth to gather data in the fields of geography, geology, volcanology, glaciology, archeology, astronomy, meteorology and other sciences associated with geography. The scientific results of these expeditions have been recorded in a series of published monographs.

In 1943 the society continued archeological investigations in southern Mexico in co-operation with the Smithsonian institution. The field party, under the direction of Dr. Matthew W. Stirling, excavated beneath mounds on the site of a former centre of religious pilgrimages at La Venta, state of Tabasco. Near the point at which artifacts of ordinary jade were found in 1942, the excavators made the surprising discovery of art objects fashioned from emerald-green gem jade, the equal of the famous Burmese gem jade, standard of world excellence. This jade uncovered at La Venta is the only gem jade yet found in the western hemisphere.

Other discoveries at La Venta in 1943 included room-size mosaic floors made of polished green serpentine tiles, massive flat-topped altars decorated with carvings and a four-foot monkey-god carved from green serpentine.

One of the most spectacular discoveries made at La Venta in the three years of work there—a colossal sculptured human head—was represented in Washington in 1943 by a plaster cast added to the museum items in the Society's Administration building. The original head of basalt, more than 20 ft. in circumference and weighing some 20 tons, could not be moved from the discovery site.

Foreign field studies during 1943 included W. Robert Moore's investigations of war-essential minerals in Brazil, B. Anthony Stewart's records of cryptostegia rubber production in Haiti and the Dominican Republic and Luis Marden's observations of industrial and military establishments in Costa Rica and Nicaragua.

Continuing to place special emphasis on co-operation in the war effort, the society made available to the armed forces and other government agencies the facilities, records and data assembled at its Washington headquarters. These included its library, its unpublished manuscripts and photographs relating to all parts of the world and its maps and cartographic notes. Assistance was given in the preparation of manuals and guides for the use of invasion troops. As a special project the society published in the *National Geographic Magazine* 1,700 illustrations in colour showing identification insignia, service ribbons, badges, medals and decorations of the United States armed forces and other services, including women's insignia.

As supplements to the *National Geographic Magazine*, five large-scale, ten-colour maps were published: Africa; Northern and Southern Hemispheres; Europe and the Near East; Pacific Ocean and the Bay of Bengal; and the World, the latter on a special projection showing the land masses and seas in a unified picture.

News bulletins, giving background information—geographic, economic and historic—of places brought into the news by war developments, were supplied to more than 500 daily newspapers in the United States. *Geographic School Bulletins* were furnished to 31,000 schoolrooms during the educational year to aid in keeping the teaching of geography up to date. (G. GR.)

National Guard.

In the spring of 1943, the chief of staff of the army announced that the American army had assumed globular offensive in all theatres. Offensive operations began in 1942, and it was in 1942 that war department press releases showed that in every offensive national guard units participated, notably, the 164th infantry regiment from North Dakota participated with the marines on Guadalcanal, and when the marines were relieved from that area, other national guard units from the American division, under General Alexander Patch, replaced them. The 34th infantry division from Minnesota, Iowa and South Dakota participated in the landing in North Africa and in the heavy fighting that followed there. They were joined later by the 45th infantry division, the 36th infantry divi-

sion, and many anti-aircraft regiments and separate battalions, with some national guard regiments attached to other task forces operating in Sicily and on into Italy where all of these troops distinguished themselves.

From the southwest area, General MacArthur announced the participation of the troops of the 32nd infantry division (Wisconsin and Michigan), and the 41st infantry division (Oregon, Washington, Idaho, Montana and Wyoming), operating with the Australian units in subduing New Guinea, particularly, Buna and the Milne bay areas. At various times in 1943, the brilliant work of the 37th infantry division was reported and the 43rd infantry division (New England), participated in activities in the capture of Rendova and others of the Solomon Islands.

In Dec. 1943, announcement was made that the 27th infantry division (New York), particularly the 165th regiment known as "The Fighting 69th" of World War I and Civil War fame, had retaken Makin Islands.

From Alaska came the news that national guard combat teams helped retake the islands of Amchitka, Attu and Kiska. In all areas, divisions were not the only national guard troops involved. All were accompanied by anti-aircraft battalions and special artillery and engineer units which were originally national guard organizations carrying the standards of those organizations.

In the middle of December the war department news release again mentioned "National Guard units from Texas" participating in the occupation in Arawe in New Britain. These units were part of what was known as the "Texas Cavalry Brigade." The 36th infantry division, at that time, was operating brilliantly in Italy and that division was known as "Texas' Own." Other divisions were gradually being moved to the front in the combat zones and as the year 1943 drew to a close, the bulk of the national guard with three years intensive training, reorganization, re-equipment, had actively participated. The 29 air squadrons of the national guard all had met the enemy and many of their officers had been highly decorated. Under state control there were no national guard troops either in 1942 or 1943.

State Guards.—As the national guard of the states and territories entered the federal service, it was found necessary to provide for internal security and protection and the organization of other troops which bore the name "State Guards" The formation of these troops was authorized by congress in Oct. 1940, and it was not until 1941 that they came into existence in full measure. Many states had no provision in state law for such emergency units. The governors of many states had to appear for the first time to obtain sanction of their state assemblies for the emergency measures which they had taken and to justify expenditures which the states had made toward the formation, training and equipment of state guards. In many states the legislatures modified the actions of the governors and there was much reorganization and stabilizing throughout 1943. However, the states provided for increased training and particularly for special schools for officers and non-commissioned officers, and some degree of field training.

The turn-over of personnel in the state guards was, in some cases, 100% annually, due largely to the induction of its personnel into federal service. The increased tempo of selective service virtually compelled the state guards to find its manpower in boys who were under 18 and men who were over 45, and among men who had been rejected for even limited field service in the forces of the United States.

The state guards were active in the suppression of riots in Detroit, Mich., Mobile, Ala., Beaumont, Texas, and many other places. All through the middle west, thousands of them combatted the flood waters of the Ohio, Mississippi and Missouri, and saved millions of dollars worth of property. In West Virginia they went into the mines to bring out the dead and living in mine disasters. In California, and along the Atlantic seaboard, they patrolled beaches and other vital points releasing combat troops of this responsibility. At the end of the year there were more than 150,000 standing ready for emergency, subject to the orders of their state executives. They were better armed, better equipped and better trained than at any previous time.

(J. F. Ws.)

National Housing Agency.

During 1943 the major concern of the National Housing agency continued to be the provision of housing for war workers. As a result of its efforts it was possible to say, as the year drew to a close, that the war housing program had reached an advanced stage and in many localities had caught up with the immediate need. Since the start of the emergency in mid-1940, some 1,350,000 units of war housing had been completed, another 210,000 were in various stages of construction, and over 1,500,000 in-migrant war workers had been housed in existing private structures. During the first ten months of 1943, a total of 392,423 units of war housing had been started and total completions in the same period amounted to 489,329.

These substantial accomplishments were made possible by the conversion of the house building industry to a complete war basis and by the closer integration of the war housing program with the total war effort.

Complete war status for the house building industry was achieved through a variety of steps. One of the most important was the very substantial savings in the use of critical materials. The National Housing agency worked closely with the industry and with other governmental agencies to eliminate every unessential use of metal, particularly, in housing construction, and to develop wherever possible substitutes for the most critical items. A corollary of this conservation program was the redoubling of efforts by the National Housing agency to accommodate an ever-increasing number of war workers in structures already in existence. This was done through share-your-home campaigns and also through efforts to get property owners to convert their structures into additional housing accommodations either with their own or with government funds. Also the National Housing agency co-operated closely with private industry and private finance to develop their maximum participation in the war housing program.

The year 1943 was the first full year of operation under the consolidated National Housing agency, which had been formed early in 1942 to focus and direct the urban housing activities of the federal government. Into the agency had been consolidated the housing activities formerly carried on by some 16 agencies and administrative units. The new set-up resulted in a streamlining of the organization on a functional basis. The office of the administrator (John B. Blandford, Jr., in 1943) performed the over-all, fact-finding and planning functions which consisted primarily of formulating war housing policy and programming war housing, including its postwar disposition. (J. B. Bl.)

Federal Housing Administration.—The Federal Housing administration (one of the three major units of the National Housing agency) continued to gear its activities to the national war effort in 1943. Under its program, private investment funds totalling around $7,341,171,462 were mobilized to finance war housing projects, to place existing home mortgages on a sound amortized basis, and to make possible essential repairs, fuel conservation installations, and conversion projects to provide additional dwelling units to house war workers.

FHA field offices processed private war housing priority requests on behalf of the War Production board and made com-

pliance inspections of privately financed war housing built under War Production board priorities to determine conformity of the construction with regulations regarding the use of critical materials. FHA technical facilities were used to the utmost to further sound housing construction under war restrictions and shortages of critical war materials. Commissioner in 1943 was Abner H. Ferguson.

Congress twice amended title VI (War Housing insurance) of the National Housing act under which FHA principally operated in 1943 by increasing from $800,000,000 to $1,600,000,000 the aggregate amount of mortgages insurable under this title, and by extending the expiration date of title VI insurance authority from July 1, 1944, to July 1, 1945.

Congress also amended title I of the act by extending the expiration date of the insurance authority from July 1, 1944, to July 1, 1947, and by increasing the maximum permissible premium under title I from three-quarters of one percent to one percent.

Title II was amended by extending the authorization to insure mortgages on existing construction from July 1, 1944, to July 1, 1946.

Insurance of all types written during 1943 amounted to $942,493,149 compared with the high record of $1,136,473,238 written in 1942. This brought the total insurance written from June 1934, through Dec. 1943, to $7,341,171,462. These funds were advanced by private financial institutions, for the FHA lends no money. Income for 1943 was $26,574,355, of which $11,101,970 went to FHA operating expenses and $15,472,385 to the various insurance funds.

New dwelling units started in 1943 under FHA inspection totalled 137,841, compared with the previous high record of 220,344 started in 1941. Practically all of the units started in 1943 were in the officially designated critical war housing areas.

Under section 203 of title II the FHA during 1943 insured 52,408 small-home mortgages for $244,514,138, compared with 149,635 for $691,445,427 in 1942. This amount brought the net total as of Dec. 31, 1943, to 1,034,865 mortgages insured for $4,519,019,688. These mortgages are protected by the Mutual Mortgage Insurance fund, which as of Dec. 31, 1943, had net resources of $68,514,553.

Under section 207 of title II, one large-scale housing mortgage for $139,000 was insured in 1943, compared with 11 for $5,701,000 in 1942. As of Dec. 31, 1943, mortgages insured numbered 356 and amounted to $145,878,206. A total of 38,272 dwelling units was provided by the 356 projects insured from the beginning of operations. The Housing Insurance fund protecting these mortgages, as of Dec. 31, 1943, had net resources of $2,773,416.

Under section 603 of title VI, 113,659 war housing mortgages on one-to-four family dwellings for $517,656,180 were insured in 1943, compared with 68,706 for $267,015,578 in 1942. As of Dec. 31, 1943, mortgages insured under this section totalled 186,143 in number and amounted to $798,103,008.

Under section 608, mortgages on 273 large-scale war housing projects totalling $100,570,200 had been insured as of Dec. 31, 1943, with firm commitments outstanding to insure 51 more for $15,221,500. A total of 27,659 dwelling units will be provided by the 324 projects. These figures compare with mortgages covering 31 projects and totalling $16,760,200, insured from May 26, 1942, the effective date of the amendment creating section 608, through Dec. 31, 1942.

The War Housing Insurance fund protecting mortgages insured under sections 603 and 608, as of Dec. 31, 1943, had net resources of $2,014,774.

In addition to the protection of the funds, debentures issued under titles II and VI of the National Housing act are guaranteed unconditionally as to principal and interest by the United States.

Under title I, a total of 308,161 property improvement loans for $96,373,831 was reported for insurance in 1943, compared with 432,755 for $155,551,033 reported in 1942, bringing the grand total to 4,437,977 for $1,777,600,360. (A. H. F.)

Federal Home Loan Bank Administration.—The FHLB administration directs the home-financing and related activities of agencies which were under the supervision of the Federal Home Loan Bank board prior to an executive order of the president of Feb. 24, 1942. These agencies are the Federal Home Loan Bank system, the Federal Savings and Loan Insurance corporation and the Home Owners' Loan corporation.

The executive order was issued under authority of the First War Powers act, 1941, approved Dec. 18, 1941. It consolidated the urban housing activities of the government under the newly established National Housing agency and designated John H. Fahey, former chairman of the Federal Home Loan Bank board, to direct the Federal Home Loan Bank administration with the title of commissioner. By the same order, the United States Housing corporation was placed under the Federal Home Loan Bank administration for liquidation. Commissioner of the FHLB administration in 1943 was John H. Fahey.

Federal Home Loan Bank System.—The Federal Home Loan Bank system was created by act of congress approved July 22, 1932, to provide reserve credit facilities for thrift and home-financing institutions—namely, savings and loan associations and institutions of similar type, mutual savings banks and life insurance companies engaged in home mortgage finance. The system in 1943 functioned through 12 regional Federal Home Loan banks, located in Boston, New York, Pittsburgh, Winston-Salem, Cincinnati, Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland and Los Angeles.

Institutions approved for membership were required to invest in the capital stock of their respective regional banks. Of the aggregate stock of the banks, as of June 30, 1943, approximately 69% was held by the government. In addition to their capital stock, the regional banks obtained their funds from the public sale of debentures and by accepting deposits from member institutions.

The funds of each regional bank were used mainly in 1943 to make short- and long-term advances to member institutions for the purpose of providing additional accommodations for first mortgage loans on homes.

The growth and present resources of the bank system are evidence of its value in the field of home mortgage finance.

On Jan. 1, 1933, it had but 101 member institutions, with estimated assets of $217,000,000. By June 30, 1943, membership had increased to 3,774, of which 2,261 were state-chartered savings and loan associations, 1,468 federal savings and loan associations, 23 life insurance companies, and 22 mutual savings banks; their combined assets were approximately $6,045,000,000. On the same date, the paid-in capital stock of the regional banks amounted to $179,461,850 and their consolidated assets totalled $260,628,000.

Under the leadership of the 12 regional Home Loan banks, the member institutions of the system in 1943 took an active part in the financing of homes for workers in the areas of war industries and in promoting the sale of war bonds and other government securities.

Federal Savings and Loan Insurance Corporation.—The Federal Savings and Loan Insurance corporation, a permanent instrumentality of the United States, was created by congress in 1934.

DWELLINGS FOR WAR WORKERS in San Francisco, Calif., under the supervision of the National Housing agency. Variation was achieved through different types of balconies and gables

It was established to insure the safety of investments, up to $5,000 per investor, in each federal savings and loan association and in each state-chartered institution of the savings and loan type which applied and qualified for this protection. As of June 30, 1943, associations to the number of 2,428 and with total assets of $3,880,000,000 had become insured, of which 1,468 were federal savings and loan associations and 960 were state-chartered institutions. On June 30, 1943, the corporation had accumulated reserves amounting to nearly $42,000,000, in addition to its capital of $100,000,000, originally provided by congress.

Home Owners' Loan Corporation.—The Home Owners' Loan corporation was created by congress in 1933 to make loans, during a three-year period, directly to distressed urban home owners by taking over their delinquent mortgages. Since its lending operations ceased in 1936, the corporation has been engaged principally in collections on its loans and in the sale and rental of the properties it was forced to acquire.

Loans were made at an interest rate of 5%, later accepted at 4½%, and were to run for a period not over 15 years and be retired through monthly payments. In 1939 the law was amended to permit the corporation to extend its loans to a maximum of 25 years in justified cases.

Provided with $200,000,000 initial capital, HOLC was authorized to issue U.S. guaranteed bonds in an amount not to exceed $4,750,000,000, of which $3,489,453,550 were issued. A total of $1,735,509,700 in bonds was outstanding as of June 30, 1943.

HOLC made more than 1,000,000 loans, which, with later advances to borrowers for taxes, and other costs, increased its cumulative investment from the beginning of operations through June 1943, to $3,484,000,000. By monthly collections and continuous sale of the corporation's acquired properties, this amount had been reduced to $1,632,000,000, as of June 30, 1943. In other words, on that date the corporation was liquidated by 53.1%. More than 243,000 loans had been paid off in full. Over the same time, the corporation acquired 195,643 properties, of which 170,652 had been sold by June 30, 1943. During 1943, HOLC was liquidating its assets at a faster rate than in any year since it began its liquidation program in 1936.

United States Housing Corporation.—The United States Housing corporation was created in May 1918, to provide housing for war workers during World War I. On June 30, 1943, the corporation held an interest in real estate with an approximate value of $543,743. The major portion of these assets represents properties in Philadelphia, the final liquidation of which had been delayed by tax litigation. Originally under supervision of the secretary of labour, the corporation was transferred to the secretary of the treasury in 1937, to the Federal Works agency in 1939, and then to the Federal Home Loan Bank administration in 1942 to complete its liquidation. (J. H. FA.)

Federal Public Housing Authority.—Created by presidential executive order Feb. 24, 1942, the Federal Public Housing authority is the constituent unit of the National Housing agency responsible for fiscal and construction activities in connection with public housing. Under the executive order, the authority assumed the housing functions of the United States Housing authority, Defense Homes corporation, Farm Security administration (except farm housing), divisions of defense housing and mutual ownership of the Federal Works agency, Public Buildings administration, and war and navy departments (except on army and navy reservations or posts). On Sept. 30, 1943, the Federal Public Housing authority had under its jurisdiction or control a total of over 700,000 units. The great majority, 80%, were war housing units while the remaining 20% were low-rent units formerly administered by the United States Housing authority and the Farm Security administration.

Commissioner of the FPHA in 1943 was Herbert Emmerich.

On Sept. 30, 1943, approximately $2,000,000,000 had been provided by congress or made available under legislation for public war housing. From these funds a total of 716,000 public war housing units had been programmed. Of these totals, approximately $1,800,000,000 (90%) had been allotted to the FPHA and 575,000 units (80%) were under its jurisdiction or control. The remainder of the war housing program was primarily carried out under the direction of the army and navy on military posts and reservations. Essentially all of the war housing produced in 1943 was of temporary construction in order to hold the use of materials and labour to a minimum. A temporary family dwelling for war workers contained 1,917 lb. of critical materials, only 20% of the 9,712 lb. of such materials which went into a prewar house. Of the 575,000 war housing units under the jurisdiction of the FPHA on Sept. 30, 1943, 72% had been completed; 19% were under construction and scheduled for completion within a few months, leaving only 9% in the planning or land acquisition stage. Family dwellings comprised 453,000 units or 79% of the war housing program; 79,000, or 14% were dormitory units; 43,000 or 7% were trailers.

The Federal Public Housing authority also performs the functions previously carried out by the United States Housing

authority which operated under the United States Housing act of 1937. This act authorized the United States Housing authority to make loans in an amount not to exceed $800,000,000 to local housing authorities to enable them to build low-rent housing projects for families in the lowest income group and for whom there was a lack of decent, safe and sanitary housing within their means. These loans may be made for as much as 90% of the capital cost of projects and may be repaid with interest over a period of up to 60 years. Actually, however, on June 30, 1943, the end of the fiscal year, the FPHA, on loans finally closed, had loaned but 70% of the cost of projects. In addition to an authorization for loans the United States Housing act of 1937, as amended, authorized the United States Housing authority to make annual contributions to local housing authorities to reduce rents in an aggregate amount not exceeding $28,000,000 a year. Although on June 30, 1943, the FPHA had outstanding commitments for the maximum amount, it was actually liable for only $13,000,000 during the year because a number of projects were suspended for the duration of World War II, and others were diverted to war housing use during the emergency. On June 30, 1943, the total units in the FPHA program under the United States Housing act amounted to 187,000 units. Of these, 163,000 units were in an active status and 24,000 had been suspended for the duration of the war. Of the units in active status, 106,000 units were in the low-rent program and 57,000 units had been diverted to war purposes. In addition to the low-rent units under the United States Housing act, the FPHA in 1943 had under its jurisdiction 22,000 family dwellings which were built by the Public Works administration, and 5,000 units which were transferred to the FPHA from the Farm Security administration.

Despite the fact that a large proportion of the FPHA war housing program was in exceedingly small communities where there were no local housing authorities, 137,000 or 41% of the war housing units completed on June 30, 1943, had been developed by local housing authorities and 197,000, or 59% were under local housing authority management. Of all housing, both war and low-rent, which had been completed and which was under FPHA jurisdiction as of June 30, 1943, a total of 321,000 units, or 69% of the entire program, was being managed by local housing authorities. (*See* also HOUSING.) (H. EH.)

National Income and National Product.

As the U.S. economy moved forward to the virtual peak of mobilization for war in 1943, the national income continued the phenomenal rise initiated in 1940. The new high record of national income reached in 1943 was $147,200,000,000, compared with the 1942 total of $119,800,000,000. The preliminary estimate of the gross national product for 1943 was $187,500,000,000 as compared with the total of $151,700,000,000 for 1942. In 1939 the national income was $70,800,000,000 while the gross national product was $88,600,000,000.

Meaning of National Income and Gross National Product.—National income as understood in this survey represents a summation of the net earnings of the various factors of production derived from their association in current economic production. Both money income and income in kind are included, so long as they are derived from participation in current production. Such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses, and gains from illegal activities are excluded since they do not represent earnings derived from current productive activity. The incomes included in the compilation are net incomes; that is, in the case of business enterprises, the incomes are counted after deduction of costs of doing business and after allowance for depreciation and business taxes. In the case of corporations the income is taken after allowance for income and excess profits taxes. The estimates are limited to those incomes which are ordinarily derived from the market economy. Thus, the value of the services of housewives is not included, whereas the income derived from government employment or government obligations is included. It is well to emphasize that the national income is not simply the sum of money incomes of all persons in the nation, such as might be reported for income tax purposes.

The gross national product, as measured by the U.S. department of commerce, represents a summation of three major components: (1) the market value of goods and services flowing to consumers, (2) the value of the gross output of capital goods retained by private business, and (3) the cost value of the goods and services produced or purchased by government. The gross national product differs from the national income in that no allowance is made for depreciation and other reserves (which constitute business expenses in the computation of income) or for taxes paid by business.

Changes in U.S. National Income, 1919–43.—Estimates of national income from 1919 to 1943 are shown in Table I. It will be noted that the economic boom associated with World War I reached its high point in 1920. There followed a sharp and short liquidation in 1921 and then an almost continuous upsurge of economic activity during the prosperous '20s, with a new high for national income in 1929 not surpassed until 1941. The magnitude of the disastrous depression of the early '30s may be seen in the fact that the national income was more than halved between 1929 and 1932.

Table I.—National Income in Current and Average 1935–39 Dollars

Year	Current dollars	1935–39 dollars*	
	Total (In 000,000,000s of dollars)	Total (In 000,000,000s of dollars)	Per capita ($)
1919	67.6	47.8	455
1920	69.7	44.1	414
1921	52.6	40.8	377
1922	60.4	49.5	451
1923	70.0	56.7	508
1924	70.0	56.4	499
1925	74.6	59.5	518
1926	76.8	60.7	521
1927	76.2	61.9	524
1928	80.1	64.8	541
1929	83.3	68.1	566
1930	68.9	58.0	471
1931	54.5	51.0	411
1932	40.0	41.6	334
1933	42.3	45.7	364

*Adjusted for price changes by use of a combination of cost of living indexes of urban workers and farmers and price index of capital goods.
†Preliminary.

The estimates in the accompanying tables are in terms of dollars and consequently are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national income, is required, a series depicting this volume is also shown in Table I, average prices of 1935–39 being used as a base. Entirely adequate price information for adjusting the national income in current dollar terms was not available in 1943, but the estimates in Table I are sufficiently accurate for most purposes.

There are two interesting points to be observed in connection with these estimates of real national income. The first is that the year-to-year changes in the total are considerably less violent than in the estimates of national income in current dollars. The

depression of 1921, for example, was largely accounted for by a drop in prices rather than by a decline in physical output. The depression of the early '30s was also partly a result of price movements, although in this instance the decline in real income was very substantial. On the other hand, the recession of 1938 was to a smaller degree accounted for by a decline in prices. It may be noted, however, that the volume of net output after adjustment for price changes was higher in 1939 than in 1937, whereas the reverse was true of national income in current dollars.

The second point is that the comparison between the general level of national income in the '30s as against the '20s is more favourable to the latter decade if real output is used than if the money value is used. In other words, the lower level of the national income in the '30s is partly accounted for by the lower prices prevailing in that period. It is striking, for example, that the real national income in both 1937 and 1939 exceeded that of 1929. Furthermore, the real national income in 1939 was 50% above that of 1919, whereas the current dollar value showed less than a 5% increase. This large rise in real income is a reflection of the increase in the capital and labour resources being utilized in the productive process and also of the tremendous advances in productive efficiency occasioned by technological development. So far as the importance of the latter factor is concerned, it is significant that the larger quantity in 1939 over 1919 was achieved with a smaller percentage utilization of the available productive capacity of both men and machines.

In assessing the importance of the rise in national income over time, it is also essential to take account of the increase in population. As population rises there are, of course, more persons to share in the goods being produced for present and future consumption and also more hands available for contributing to total output. The changes in income produced per capita, after adjustment for fluctuating prices, are shown in Table I.

The outbreak of World War II marked 1939 as the end of a definite phase in the economic life of the nation. The stimulus provided by the great U.S. defense effort was already evident in 1940, when the national income rose more than $6,000,000,000, even though the program was not inaugurated until the middle of that year. It was not until 1941, however, that the full impact of the rearmament program became apparent. In that year the national income rose by $17,000,000,000.

With the actual outbreak of war at the end of 1941 the efforts to obtain the maximum output of armaments in the United States were intensified, leading to an ever greater use of available economic resources. As a consequence, the national income continued to expand in 1942, with a gain for the year of almost $22,000,000,000.

The sharp upward movement was continued during the first half of 1943, but during the latter months of the year there was a decided levelling off in the rate of income gain. Nonetheless, for the year as a whole, the national income showed a substantial rise of over $27,000,000,000. As may be seen from the statistical data in Table I, the rise in the national income after 1940 was in part due to the rising trend of prices, but the larger part of the expansion represented an increase in real income.

Distributive Shares of the U.S. National Income.—An analysis of the national income in terms of shares of income paid or accruing in the various factors of production is presented in Table II. Because of certain conditions and controls of wartime, the changes recorded for the various distributive shares in later years departed from the pattern which was customary under peacetime prosperous conditions.

Total salaries and wages continued to rise precipitously in 1943. This component of the national income exceeded $100,000,000,000 in 1943 for the first time in the nation's history,

*Preliminary.

more than double the figure of 1940. Although the salary and wage total was affected by rising wage rates over this period, the record-breaking expansion represents mostly the fact that new millions of persons were put to work and that the employed population as a whole was working considerably longer hours than was the case two years earlier. Also, the poorer paid industries tended to shrink relative to the higher paid heavy goods industries, the latter having expanded tremendously to meet the requirements of total war. Of course, the absolute increase in wages and salaries was the largest of any component of national income, but this result was merely due to the fact that wages and salaries bulked so large in the total.

All through the war period the net income of agricultural proprietors recorded the largest percentage gain among the distributive shares of national income. In 1943 agricultural net income reached a record total of $12,700,000,000. This compared with $9,700,000,000 in 1942 and constituted an almost three-fold increase over agricultural net income in 1939. The precipitous increase in agricultural income over these years was partly accounted for by record-breaking output of food and other farm products, though by far the more important influence there was a substantially higher level of agricultural prices.

The net income of other noncorporate business continued to advance in 1943 though in less spectacular fashion than in the case of wages and salaries or farm income. The total of $11,200,000,000 for this component of the national income in 1943 represented a rise of 8% over the previous year and 65% over 1939. Both the interest and rent components of the national income were relatively stable in 1943 though over the entire war period there occurred a quite substantial increase in aggregate net rents.

In the absence of new legislation with respect to corporate taxes in 1943, net income of corporations advanced with the increase of the total volume of business. This contrasted with the situation in 1942 when the heavy increase in both corporate income and excess profits tax rates held profits to their 1941 level. Over the entire war period, though corporate profits had doubled by 1943, the increase was much less than customary for this volatile component of the national income. This again was a reflection of the considerably higher taxes levied on corporation income and excess profits.

Industrial Origin of National Income.—Statistics on the industrial origin of national income are presented in Table III. In this breakdown of the national income the effect of wartime conditions is clearly evident. Most noticeable are the huge gains that were made in income originating in manufacturing, government activities and agriculture. Because wartime requirements

*Preliminary.

centred so largely in manufacturing output, this component of national income became an increasingly large percent of total national income in the course of the war. By 1943 it accounted for about one-third of total income, whereas in 1939 it was less than one-quarter. The huge rise in income originating in government activities, likewise a wartime development, reflected not only the expansion of the armed forces of the nation but also the increased activities in government arsenals and navy yards. Income originating in only one industrial component in national income, namely contract construction, declined from 1941 to 1943, the reason being the passing of the peak in the construction phase of the war production program.

Gross National Product.—The statistical components of the gross national product are shown in Table IV. The outstanding development revealed by the table is the spectacular increase in total gross national product after 1940. By 1943 the gross national product reached the amazing total of $187,500,000,000, in comparison with $97,000,000,000 in 1940. Of course, it is well known that part of this increase was caused by a rise in prices rather than by expansion in a physical volume of goods and services produced. These two factors cannot be separated in an entirely satisfactory manner for a period which covers the transition from a peacetime to a war economy. However, approximate measures indicate that more than two-thirds of the expansion in the value of the gross national product represents additional goods and services produced, and that less than one-third represents the effects of inflation. There is little doubt that the productive potential of the U.S. economy was realized in the course of the war to an extent that would not have seemed possible a few years earlier.

The driving force behind the expansion was federal government expenditures for goods and services required in the rearmament and war efforts. (The figures shown in the table for war expenditures are not the same as total government outlays for war purposes since some of these outlays might not have been for currently produced goods and services.) While there was a significant increase in war output during 1940, owing to the inauguration of the defense program in the middle of that year, the real results of the defense program became fully evident in 1941, when war expenditures exceeded $11,000,000,000. Pearl Harbor brought an intensification of the war effort and the setting of new goals for war production, which in 1942 carried war expenditures to the spectacular total of approximately $50,000,000,000, a figure constituting about one-third of the gross national product.

In 1943, when the virtual peak of the war production program was reached, war expenditures totalled almost $85,000,000,000, and accounted for 45% of the gross national product. The success of the nation's economic mobilization for war is amply demonstrated by these figures.

It may be observed that both in 1940 and 1941 the expansion of war production did not require any curtailment of goods and services available for private use. As a matter of fact, in both those years nonwar production was steadily increased. This was the case with both capital formation and consumers' goods and services, and was possible because at the beginning of the rearmament program the nation had available a huge pool of unemployed economic resources, both men and machines. In 1942 and 1943, however, this situation came to an end, and the value of war output increased more than the total gross national product. Both federal nonwar and state and local government utilization of current production were decreased. The major cut, however, came in the field of private capital formation, where the record-breaking 1941 total of over $19,000,000,000 was reduced to $1,000,000,000 by 1943. Both private construction and private purchases of machinery and equipment were drastically curtailed. Furthermore, business inventories were curtailed in both 1942 and 1943 in contrast to the substantial accumulation in 1941 and a change in the same direction occurred with respect to the nation's export balance (excluding lend-lease).

In terms of actual dollars spent, consumers' purchases of goods and services actually increased in 1942 and 1943. This rise, however, merely reflected the influence of rising prices; in terms of dollars of constant purchasing power, the goods and services received by consumers was relatively stable after 1941. That it was possible to maintain consumers' goods and services at so high a level in the face of the tremendous requirements of the war program was due to two important factors. In the first place, the total of consumers' purchases was larger than current production by virtue of the drawing down of business inventories of consumers' goods. In the second place, the fact that the United States did not reach an overall manpower shortage until 1943 meant that the restrictions on consumers' goods output were due entirely to shortages of raw materials and imported commodities. Because the war program consisted mostly of munitions and munitions' manufacturing facilities, the material shortages were largely confined to durable goods. It may be seen that consumers' durable goods declined fairly sharply, and this decline would have been very much greater had it not been for previously accumulated inventories. While there were isolated shortages among the nondurable goods, on the other hand, many of these commodities as well as virtually all consumers' services were increased. The decline in consumers' durable goods, therefore, was entirely offset by increases in nondurable goods and services.

Consumer Income and Savings.—Table V contains a breakdown of the national income by use of funds. The primary purpose of a breakdown of this sort is to show the impact of taxes

*Preliminary.

upon the flow of personal income and the proportionate allocation of income after taxes between expenditures for consumption and savings. These data are of particular importance in time of war since they indicate the magnitude of the inflationary pressure generated by the huge volume of government war expenditures.

In 1943 the flow of income to individuals continued to rise sharply as it had during the earlier years of the war. The total of $141,800,000,000 was more than double the income flow in 1939. Partly offsetting the rise in income was a large advance in tax payments. However, the increase in taxes was far from large enough to offset completely the advance in individual income, so that income after taxes rose from $108,800,000,000 in 1942 to $125,000,000,000 in 1943.

As previously mentioned, the quantity of goods and services available for consumers' purchase remained relatively stable in 1943. The consequence of this fact together with the continued rise in disposable income was to continue the heavy pressure on consumers' goods prices. As a result, consumer expenditures rose from $82,000,000,000 in 1942 to over $90,000,000,000 in 1943, with the increase representing higher prices paid rather than more goods and services received. Nonetheless, the administrative mechanisms of price control and rationing were fairly effective in limiting price advances so that net savings of individuals again rose substantially. It is interesting to note that consumer expenditures rose by about the same amount in both 1942 and 1943 (with about the same quantity of goods being available in both years) although the rise in income after taxes was somewhat larger in the earlier year. Savings, therefore, rose by $13,000,000,000 in 1942 but only by $8,000,000,000 in 1943. (*See* also BUDGET, NATIONAL; BUSINESS REVIEW; NATIONAL DEBT; WEALTH AND INCOME, U.S. DISTRIBUTION OF.)

(M. GT.)

National Labor Relations Board.

More than 9,500 cases were filed with the board in 1943, the third largest number in the board's history. This number was exceeded only in 1941, when industry was expanding to meet defense needs and in 1938, when a pent-up flood of cases was released by the supreme court's upholding of the constitutionality of the Labor Relations act. In 1943, the board's close relation to war production was seen in the fact that 50% of the new cases were concentrated in seven industries, all essential to the war effort: iron and steel, machinery, aircraft, food, shipbuilding, chemicals, and electrical machinery.

Of the 9,543 new cases filed, election cases numbered over 6,000, the largest number received in any of the eight years of the board's activity. Charges of employer unfair labour practices decreased to 3,400, the lowest number filed in any of the five preceding years. The shift to election cases was accentuated by frequent agreement of all parties that the board's election facilities be utilized. Thus, more than half of the representation cases were characterized by agreements of employers and labour organizations that a question of representation existed and should be resolved without the necessity of formal hearings and directives of the board. As a consequence, they agreed on all the details of the referendum, indicated that they would abide by the results, and availed themselves of the board's election machinery.

As in preceding years, an overwhelming number of unfair labour practice cases were closed by the board without the necessity for formal proceedings. In 1943, the board closed 86% of such cases in the informal stages by means of withdrawal, dismissal and settlement of charges made against employers.

A total of 4,153 elections were conducted by the board during the year. Valid votes were cast by 1,126,501 workers. Of the 4,153 elections, 1,766 were won by affiliates of the Congress of Industrial Organizations, 1,398 by American Federation of Labor unions, 416 by unaffiliated labour organizations, and in 573 elections a majority of votes was not received by any of the organizations appearing on the ballot.

Remedies in unfair labour practice cases closed in 1943 were varied. Company-dominated unions were disestablished in 205 cases. A total of 8,361 workers was reinstated after discriminatory discharges and after strikes caused by unfair labour practices. Back pay amounting to $2,284,593 was paid to 5,115 workers who had been the victims of discriminatory practices. Notices of compliance with the act were posted in 1,110 cases.

The liaison procedures with other federal agencies, established in the defense and early war periods, were extended in 1943. Among the agencies with which the board exchanged information were the war and navy departments, the War Production board, the War Shipping administration, the National War Labor board, and the Conciliation service of the department of labour. Essentially, the board's function in relation to war plants in which other agencies were interested was to act with speed and to assign these cases a priority in handling.

Distinction must be drawn between the basic functions of the National Labor Relations board and of the National War Labor board (*q.v.*). The former was entrusted by congress with the duty of preventing and remedying unfair labour practices and to determine representatives for collective bargaining. The War Labor board was established to settle wartime disputes involving wages, union security, and other substantive provisions of labour agreements. The NLRB co-operated closely with the WLB by exchange of information and a close integration of efforts. Typically, determination by the NLRB of bargaining representation in many plants was a first step to the settlement by WLB of disputes concerning wages and conditions of employment.

In 1943, as in 1942, litigation in the courts was concerned chiefly with enforcement of board orders. The United States supreme court and the various circuit courts of appeals reviewed 100 board orders. In the supreme court, three of the four board orders were upheld and enforced in full. In the circuit courts of appeals, 87 of the 96 cases reviewed resulted in enforcement of board orders. In several cases the problem was whether anti-union statements made by an employer were protected by the constitutional guarantee of freedom of speech or whether such statements were violations of the National Labor Relations act. The supreme court refused to grant certiorari in three such cases, leaving in effect these lower court rulings: Where an employer's action consisted solely of an expression not containing any expressed threat and the record of his activities did not reveal any other anti-union activities, such utterance was protected by the Fifth amendment. Where the written or oral conduct of an employer constituted a threat, such utterance was not protected by the Fifth amendment. Where an employer made statements, written or oral, as well as committing other anti-union acts, the total activities of the employer (including the letter or statement) amounted to unlawful coercion under the act.

During 1943 the board figured in three legislative enactments.

In the first, congress imposed, through an amendment to the Appropriation Act of 1944 and for the duration of the fiscal year, a limitation upon board use of funds so as to prevent it from acting in any unfair labour practice case arising over a labour agreement which had been in existence for three months or longer before a charge was filed. In the second, the board was entrusted with the new task of protecting the rights and benefits of employees affected by the merger of domestic telegraph carriers, under an amendment to the Communications Act of 1934. In the third, the board was assigned the duty of conducting strike votes in accordance with section 8 of the War Labor Disputes act. In the first six months of this new law, often referred to as the Smith-Connally act, 654 strike notices were filed, 444 were withdrawn and 117 strike votes were conducted. (*See* also LABOUR UNIONS; LAW; STRIKES AND LOCK-OUTS.) (H. A. MS.)

National Lawyers Guild.

The National Lawyers guild held its national convention in Chicago on Feb. 20, 21 and 22, 1943. A major project decided upon by the national executive board was to take steps toward the convening of a meeting of representatives of the bars of the United States, Great Britain and the soviet union for discussions on subjects of assistance to the United Nations in the prosecution of the war and looking toward permanent collaboration in the postwar period. The guild announced this program at dinners in honour of Sir Donald Somervell, attorney general of Britain and Wales, held in Washington, D.C., and New York in September. Simultaneously, a memorandum on this subject was submitted to the commissar of justice of the soviet union through the soviet embassy in Washington, D.C. The matter was under discussion in London and Moscow.

Among its other war activities the guild succeeded in securing a change in the policy of the war department which henceforth would make possible the granting of commissions in the judge advocate general's department to qualified Negro lawyers.

National officers re-elected for 1943 were president, Attorney General Robert W. Kenny of California; executive secretary, Martin Popper of New York; vice-presidents, Osmond K. Fraenkel of New York, Mitchell Franklin of Louisiana, Edward Lamb of Ohio, Louis F. McCabe of Pennsylvania; treasurer, Benedict Wolf of New York. Newly elected vice-presidents were Bartley C. Crum of California, Judge William H. Hastie of Washington, D.C., Judge William H. Holly of Illinois, and Judge Ira W. Jayne of Michigan. (M. PR.)

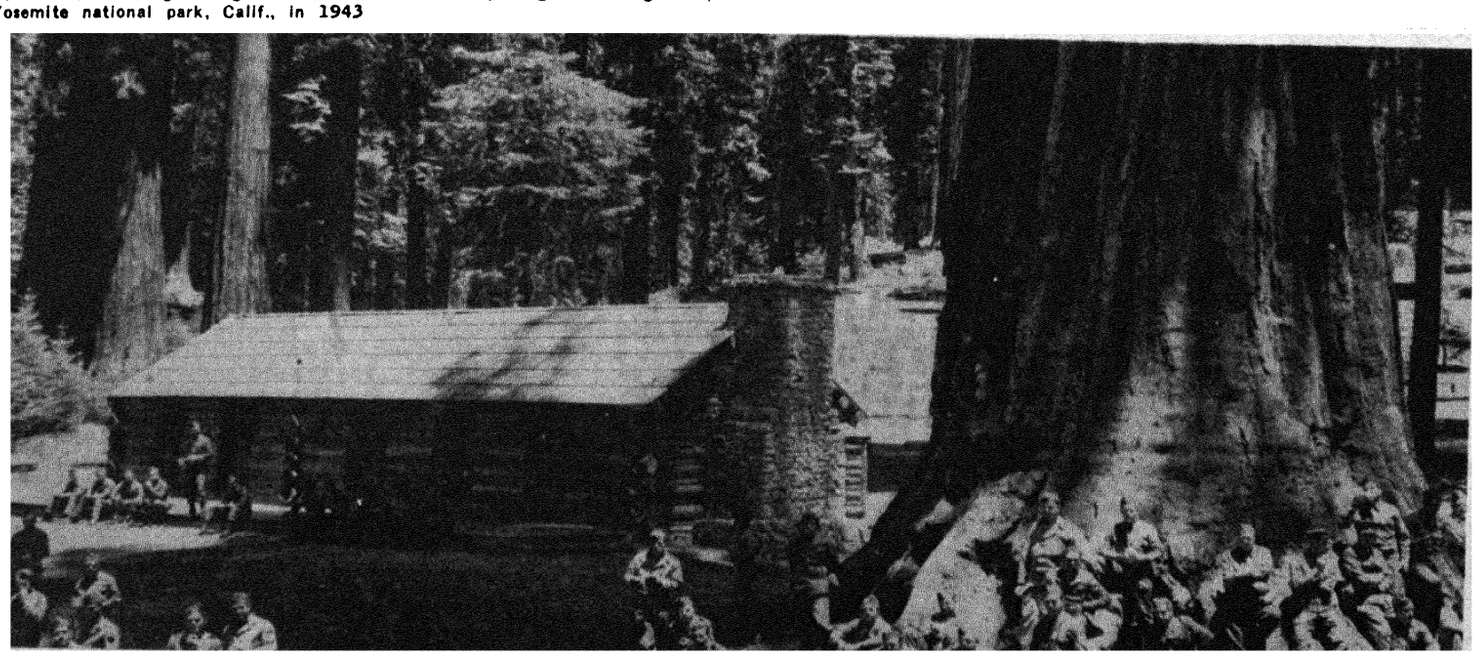
National Mediation Board.

The National Mediation board, an independent federal agency in the United States created June 21, 1934 by an amendment to the Railway Labor act of May 20, 1926, was charged with investigation of representation disputes and mediation of disputes over rates of pay, rules and working conditions on carriers by rail and air, thus to avoid interruptions to interstate commerce by rail or air transport.

During 1943, the Mediation board received 390 cases. It disposed of 360 cases, 167 representation disputes and 193 disputes involving changes in rates of pay, rules or working conditions.

On Nov. 22, 1943, the United States supreme court decided three cases involving interpretation of the Railway Labor act. In one of these decisions it was held that the Mediation board's determinations and certifications in representation proceedings were final and not subject to review by the courts. In the other two cases it was held that jurisdictional disputes between unions did not present questions justiciable in the courts, and that the Railway Labor act intended that such disputes are to be settled by negotiation, mediation or voluntary arbitration.

National Railway Labor Panel.—The Railway Labor act provided for the appointment of an Emergency board by the president upon recommendation of the National Mediation board to investigate and report to the president on any dispute unsettled through mediation or arbitration which threatened substantially to interrupt interstate commerce. To supplement the act during the war emergency, the president by Executive Order 9172 of May 22, 1942 established the National Railway Labor Panel, consisting of 20 members, from which Emergency boards were to be selected by the chairman of the Panel in cases where the employees refrained from taking strike votes and setting strike dates. Ten Panel Emergency boards were appointed during the year 1943 and nine of these boards filed their reports before the end of the year. (*See* also RAILROADS; STRIKES AND LOCK-OUTS.) (W. M. L.)



National Monuments: *see* NATIONAL PARKS AND MONUMENTS.

National Parks and Monuments.

During 1943 the national park service continued to make definite contributions to the war program in addition to fulfilling its primary function of protecting the 22,000,000-ac. national park system entrusted to its care.

That the national parks, national monuments, and allied areas

SOLDIERS lunching among the sequoias in the Mariposa grove of big trees, Yosemite national park, Calif., in 1943

constituting the national park system are important to U.S. citizens was attested to by the fact that, notwithstanding travel handicaps, visitors to these areas during the travel year ended Sept. 30, 1943, totalled approximately 7,000,000. Nearly 2,000,000 were members of the armed forces.

More than 300 authorizations for wartime use of park facilities and resources were granted by the service during 1943. As heretofore, inconvenience to park administration and to visitors, or remediable damage to park property were not considered sufficient reasons for denying such use. Only where the proposed uses would destroy or impair distinctive park features or qualities did the service feel justified in asking whether all reasonable alternatives had been exhausted and if the demand was based upon critical necessity.

With the intensified demands for lumber to meet war requirements, particularly Sitka spruce for aeroplane construction, the magnificent virgin forests of Olympic national park were in grave jeopardy. The service, with the strong support of the secretary of the interior, held steadfast to the principle that no trees should be cut in the park until proof was furnished that no other practicable source was available. While discussions were under way with the War Production board the situation eased as a result of cancellation of plans for a number of types of wooden planes, increased spruce aircraft lumber production in British Columbia and Alaska, and increased supplies of aluminum for aeroplane construction. As a consequence, the secretary received word from the War Production board that Sitka spruce in the park was not needed for warplane construction and that unless unforeseen circumstances arose none probably would be needed through March 1944.

In 1943 two units were added to the national park system—Jackson Hole national monument, Wyoming, established by presidential proclamation of March 15, and the Thomas Jefferson national memorial, Washington, D.C., established April 13, the 200th anniversary of Jefferson's birth and the date of the memorial's dedication by President Roosevelt. In addition, two structures in non-federal ownership—Independence hall in Philadelphia, Pa., and St. Paul's church in Eastchester, N.Y.—were designated as national historic sites. (N. B. D.)

National Youth Administration.

The National Youth administration provided training to youth between the ages of 16 and 24 who were out of school, to qualify them for jobs in war industries in which there was a present or potential shortage of labour.

Students in secondary schools and colleges were given part-time employment for small wages to enable them to continue their education.

The National Youth administration operated war production training projects through which out-of-school youths were employed in workshops to learn mechanical unit skills under conditions similar to those which are found in industry. NYA shops were operated on a multiple-shift basis and provided training in metal and machine shop work, forge and foundry work, aviation mechanics, radio and electrical work, welding and similar occupations vital to the war effort. During the twelve-month period ending June 30, 1943, the National Youth administration provided training in these skills to more than 400,000 youths.

The War Manpower commission, under whose jurisdiction the NYA operated in 1943, determined the types of training to be provided; the U.S. Employment service registered all NYA youths as an aid to their placement in industry.

The NYA program for needy students attending non-profit making, tax-exempt schools, colleges and universities provided monthly wages ranging from $3 to $6 in secondary schools and $10 to $25 in colleges and universities in return for useful work performed under the direction of the school officials. Employment was given on the basis of scholastic merit and proved need. Both programs were administered by the NYA through 11 regional offices co-ordinated through the national office in Washington, D. C. The National Youth administration was established by executive order of the president on June 25, 1935. Originally set up within the Works Progress administration, the NYA was transferred to the Federal Security agency in 1939 and came under the jurisdiction of the War Manpower commission Sept. 17, 1942. After its inception through June 30, 1942, the NYA provided jobs for almost 2,700,000 youths on the out-of-school program and more than 2,100,000 youths on the student work program.

In June 1943 the congress directed the NYA to terminate all its training activities and to complete liquidation not later than Jan. 1, 1944. The National Youth administrator was Aubrey Williams. (A. Ws.)

Navies of the World.

An inevitable result of the widespread war at sea was to stimulate the development of new tactics, new types of ships, new weapons and new methods of using weapons.

In order to get over the losses sustained in the early part of the war through the efficiency of the British "asdic" method of detection, U-boats followed fresh tactics. After 1939 most of their attacks were made on the surface at night, when their low silhouettes were difficult to spot. Star-shells, originally devised to counter destroyer attacks in darkness, were employed by escort vessels guarding convoys to reveal the submarines; and later a special type of searchlight for use by aircraft was similarly employed, the aircraft acting in concert with the escort vessels.

New types of warships included the corvette, the original design of which was based on that of the well-known whale catchers used in the antarctic. After a large number of these corvettes had been built, an improved and enlarged design superseded them; this type was known in the United States as a destroyer-escort and in the United Kingdom as a frigate. Large numbers were built for both the royal navy and the United States navy. Another new type was the escort aircraft carrier, smaller and slower than the big fleet aircraft carriers, but of great value in dealing with the submarine menace. Use of these vessels bridged the mid-Atlantic gap between the extreme ranges of shore-based aircraft, enabling every mile of the convoy route between the U.S.A. and Europe to be patrolled by aircraft. Motor torpedo boats and motor gunboats, referred to by the British admiralty under the comprehensive term "light coastal craft" also developed considerably. Not only the Allies, but also Germany and Italy made extensive use of them, though the latter country's vessels, classed as M.A.S. (*motoscafi anti-summergibili*) accomplished but little in the Mediterranean. Nor was another Italian device, a torpedo in a light framework attached to a skiff with an outboard motor, very effective. Japan contributed the midget submarine, manned by two or three men, which was used without success at Pearl Harbor, Sydney and Diego Suarez in 1941 and 1942. A British type of midget submarine, of which little is known, proved a bet-

ter invention, the biggest German battleship, the "Tirpitz," being crippled by this means. Yet another type which underwent development was the anti-aircraft ship, outstanding examples of which were the British cruisers of the "Dido" class and the U.S. cruisers of the "San Diego" type.

The magnetic and acoustic mine, and various combinations of these devices, caused many losses at sea. Originally an enemy weapon, these were laid extensively in the Baltic by the R.A.F. in 1942–43, and soon became a serious source of trouble to the Germans. The latter also produced torpedoes of novel types, one being an electric weapon which leaves no perceptible track, and the other one of acoustic pattern, which is attracted by the vibrations of a propeller.

Torpedo attack from the air underwent great development, though it was in the experimental stage during World War I. In Nov. 1940, the Italian fleet at Taranto was disabled by this means; and the destruction of the German battleship "Bismarck" in the Atlantic in 1941 was the fruit of damage caused by torpedoes from royal naval aircraft. Japan also made extensive use of this weapon, which she first employed at Pearl Harbor, in the sinking of H.M.S. "Prince of Wales" and "Repulse," and in the destruction of the U.S.S. "Hornet," "Lexington" and "Chicago."

In the tactics of night fighting, the technique developed by the royal navy in prewar days was employed with conspicuous success by Sir Andrew Cunningham's fleet at the battle of Matapan. It was imitated by the Japanese in the battle of Savo Island, when the U.S.S. "Astoria," "Quincy" and "Vincennes," and H.M.A.S. "Canberra" were sunk. In the following November the tables were turned by Admiral Halsey, who inflicted a severe defeat on the enemy in the battle of Guadalcanal. Three cruisers were believed to have been destroyed by the gunfire of the U.S.S. "South Dakota" on this occasion during a night action.

During 1943 two U.S. battleships of 45,000 tons, the "Iowa" and "New Jersey," passed into service, bringing the total of capital ships in the U.S. navy up to 22. This included the "Oklahoma," under reconstruction after capsizing at Pearl Harbor.

Aircraft carriers continued to prove their value in various directions. It is estimated that by the end of 1943 the U.S. navy would include 15 fleet carriers, some of the heavy type and others of the lighter design evolved from 10,000-ton cruiser hulls. Japan was without the shipbuilding resources to equal this, though it was suspected that four large armoured ships might have been converted into aircraft carriers in an effort to replace losses more rapidly. Many escort aircraft carriers, converted from mercantile hulls, were added to both the royal and U.S. navies, and proved useful in the Mediterranean as well as in the protection of convoys from attack by submarines in mid-Atlantic. Neither Germany nor Italy had any aircraft carriers in service.

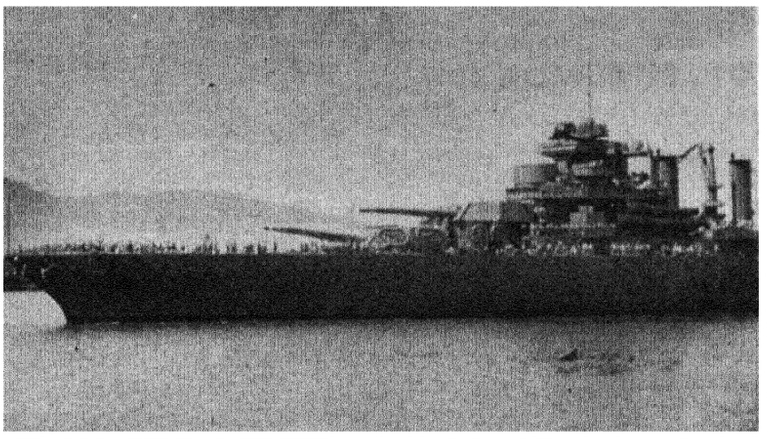
Both Allied and enemy navies incurred numerous cruiser casualties, but only the former effectually replaced them. In 1943 the royal navy lost but a single cruiser, H.M.S. "Charybdis," and the U.S. navy two, the "Chicago" and "Helena," a contrast to the preceding years. The first of the six battle cruisers laid down for the U.S.N. in 1941 had been launched and named "Alaska." There was no confirmation of the report that she might be completed as an aircraft carrier.

There was no evidence to show how far Japan had progressed in replacing her heavy losses. It was believed that at least two big new battleships of over 40,000 tons had been delivered, and new aircraft carriers and cruisers were also suspected to be ready. Destroyers and submarines were being turned out steadily at the estimated rate of 20 of each per annum.

Naval operations in the Baltic, Black sea and Arctic ocean by the soviet navy were on a small scale in 1943, being confined to submarine attacks on transports and supply ships, and occasional minor encounters between light warships.

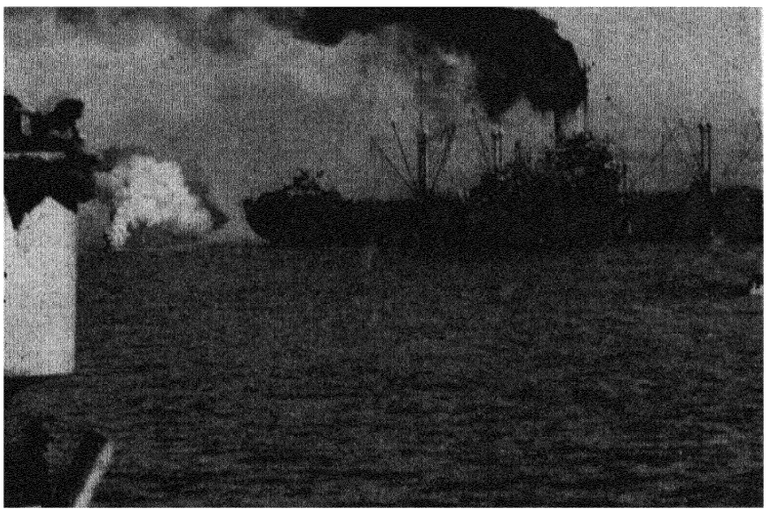
Though losses in 1943 were on an unprecedented scale, and the rate of replacement was believed to have declined, it would not be safe to assume that the number of German submarines in service at the end of 1943 was less than 300. Not more than about one-quarter of these would normally be operating at sea at the same time. Italian losses in this category up to the time of the armistice were stated to have reached a total of 84. Japanese submarines had not shown themselves very active, though they were believed to have been used for the evacuation of Kiska, in the Aleutians.

Despite losses, British submarine strength was believed to have increased during the year. Undoubtedly the activity of H.M. submarines in the Mediterranean contributed materially to axis defeats in North Africa and Sicily. U.S. submarines increased their numbers to a much greater extent, and their unceasing campaign against Japanese shipping in the Pacific was believed to be causing the enemy serious concern, as tonnage was being destroyed faster than it could be replaced.



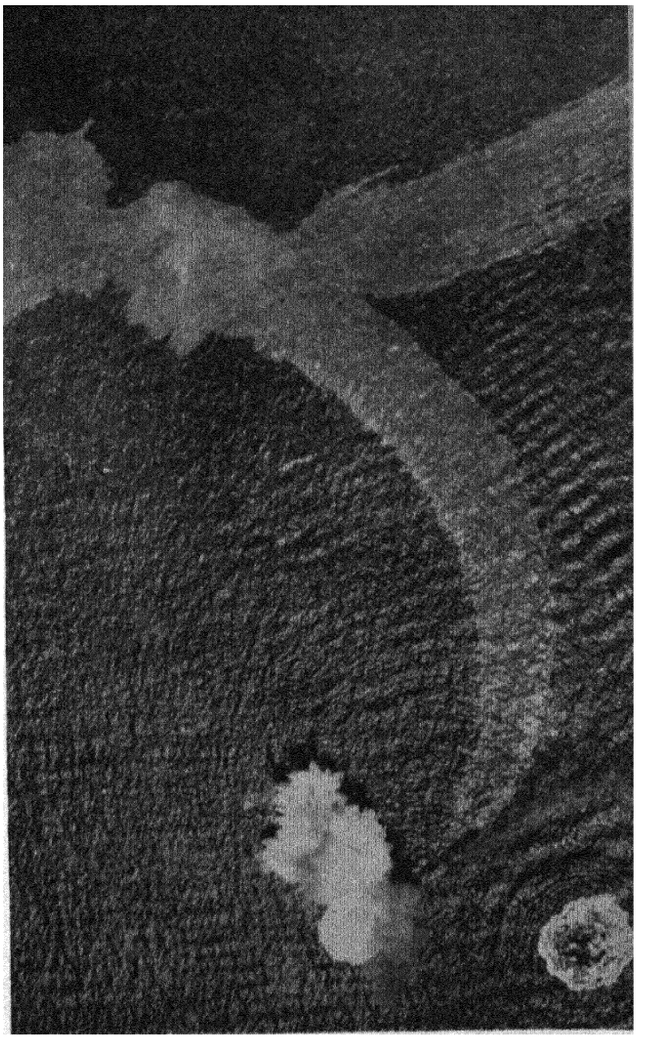
British Naval Strength.—It was stated in 1943 by the first lord of the admiralty that all losses incurred during the war had been replaced by new ships. These losses included 5 capital ships; 5 aircraft carriers; 26 cruisers; 3 fast minelayers; 107 destroyers; 58 submarines; 13 sloops; 1 frigate; 12 fleet minesweepers; 23 corvettes; 1 monitor; 9 river gunboats; 21 light coastal craft; 2 escort aircraft carriers; 2 depot ships; 14 armed merchant cruisers; 12 auxiliary minesweepers; 14 armed yachts; 168 trawlers and whalers; 18 drifters; 4 fleet tugs; and 23 miscellaneous auxiliaries.

After allowing for these losses, and for such ships as were believed to have been due for completion by the end of 1943, the strength of the royal navy at that date might be reckoned at 15 battleships (including one battle cruiser); 8 fleet and 25 escort aircraft carriers; 64 cruisers (including one cruiser-minelayer); 320 destroyers; 80 submarines; 66 sloops; 80 frigates; over 200 corvettes; about 200 fleet minesweepers; 4 monitors; 2 aircraft tenders; 2 netlayers; 9 river gunboats; 6 coastal motor gunboats, motor torpedo boats and motor launches. Trawlers, drifters, armed yachts, depot ships and mercantile auxiliaries of every description were too numerous for an estimate to be possible.



There had been no news of the completion of the four battleships of about 40,000 tons which were on order at the outbreak of war, though this did not necessarily imply that none of them had been completed.

Naval forces of the dominions, including the royal Indian, royal Australian, royal Canadian and royal New Zealand navies, as well as those of Newfoundland, South Africa, Burma, Ceylon and Kenya, are incorporated as far as possible in the above figures. Their personnel was known to have been increased greatly since war began; in the case of the R.C.N., it was expected to reach 90,000 by the end of 1943. Canada built small warships such as frigates, corvettes, minesweepers and patrol vessels in very large numbers, not only for her own service but also in some measure for the royal navy and United States navy; while Australia, besides providing for her own needs in the way of destroyers and minesweepers, had also constructed sloops for the royal Indian navy.



United States Naval Strength.—The largest program of naval construction in the history of the United States, designed to produce a "two-ocean" navy, was nearing its peak. Ships in service at the end of 1943 were estimated to be at least 22 battleships; 15 fleet and 20 escort aircraft carriers; 49 cruisers; 360 destroyers and destroyer escorts; 175 submarines; 12 gun-

U.S. BATTLESHIP "CALIFORNIA," sunk at Pearl Harbor, putting to sea in 1943, refitted and stripped of outdated equipment

GERMAN BOMB scoring a near hit immediately astern of a U.S. transport during the initial invasion of Sicily July 10, 1943

LEAVING A HEAVY WAKE of oil, a Japanese destroyer fruitlessly shifts its course to avoid Allied bombs in the battle of the Bismarck sea March 2–4, 1943. An entire convoy of 10 warships and 12 transports was wiped out by the Allies in the three-day battle

THE "GEEHEEBEE," also nicknamed "jahemy," "le Tourneau" and "jeramy," was an ingenious U.S. naval contraption introduced in 1943. Its varied uses included lifting boats and barges, clearing earth, and pulling heavy objects. Here it is shown in action on Attu Island, pulling a damaged landing craft ashore

THE U.S. LANDING CRAFT "LST" (landing ship—tank) made its fighting debut in 1943. Huge doors swing open as the ship is "beached," permitting men, tanks and supplies to move rapidly ashore

boats; 50 escort vessels (frigates); 40 patrol vessels (ex-yachts); 800 submarine chasers; 15 minelayers; 650 minesweepers; 200 motor torpedo boats; 22 seaplane tenders, and immense numbers of other fleet auxiliaries. There were also the vessels of the U.S. coast guard, including some 40 ocean-going ships besides numerous coastal craft.

Under construction or on order were 9 battleships (though 5 of these were not being proceeded with for the present); 6 battle cruisers; and an unknown number of aircraft carriers, cruisers, destroyers, escort vessels and auxiliaries of every category. Some idea of the immense strides made may be gathered from the fact that between July 1, 1940, and the corresponding date in 1943 there were completed for the U.S. navy 333 combatant vessels aggregating 1,117,054 tons and costing over $3,000,000,000; 1,274 mine and patrol craft of 199,765 tons, costing $20,000,000; 151 auxiliaries, 654 yard and district craft, and 12,964 landing craft. No naval construction program of comparable size and speed had ever been accomplished. Altogether the fleet thus created amounted to 15,376 new ships of more than 2,200,000 tons.

Total personnel on duty at July 31, 1943, was 1,782,000 officers and men of the navy, plus 315,200 marine corps and 151,200 coast guard. By the end of the year it was expected these figures would have been raised to 2,294,000 navy, 399,700 marine corps and 171,500 coast guard.

Japan.—For years past great secrecy characterized Japan's naval preparations, and this had been intensified after Dec. 1941. Allowing for the uncertainty thus produced, it was probable that at the end of 1943 there were in service 10 or 12 battleships; 6 to 8 aircraft carriers; 20 cruisers; over 100 destroyers; about 100 submarines; 15 to 20 seaplane carriers; 5 coast defense ships; and a large but uncertain number of ancillary vessels, such as minelayers, minesweepers, submarine chasers and gunboats. An unknown number of battleships, aircraft carriers, cruisers, destroyers, submarines, etc., might be assumed to be under construction.

France.—The majority of the seaworthy ships of the French navy were under the control of the Committee of National Liberation, which had its headquarters at Algiers. These included 5 battleships, 1 aircraft carrier, 10 cruisers, between 20 and 30 destroyers and about 20 submarines, besides minor war vessels such as sloops, corvettes, etc. Nearly every vessel of importance in the hands of the German-occupied administration at Vichy was scuttled or otherwise disabled at Toulon in Nov. 1942, and it was not likely that many of these could be put into service under present conditions. A cruiser and a few small craft might have passed under Japanese control at Saigon, in Indo-China. Little or no progress appeared to have been made with the few warships that were under construction in French yards before the enemy occupation.

Italy.—Excluding a few damaged or incomplete ships in German hands, the Italian navy was at the end of 1943 entirely at the disposal of the United Nations. Ships intact were believed to comprise 5 battleships, 8 or 9 cruisers, nearly 50 destroyers and between 20 and 30 submarines, with sundry auxiliaries.

Germany.—German naval strength at the end of 1943 amounted to 3 battleships, one of which was damaged and another under reconstruction; 2 armoured ships, known popularly as "pocket battleships," one of which had also been damaged; 1 aircraft carrier, apparently unfit for service; 6 cruisers; not more than 40 destroyers and seagoing torpedo boats; 2 coast defense ships; and an uncertain number of submarines (estimated at about 300), motor torpedo boats and minesweepers. Of late the enemy relied on its submarines and small craft to carry on the war afloat.

U.S.S.R.—Little more was recorded of Russian naval strength than before the war. It included 3 obsolete battleships, 2 of them in the Baltic and the other in the Black sea; 6 or 7 cruisers, of which 2 were in the Baltic and 4 or 5 in the Black sea; about 90 destroyers and seagoing torpedo boats; 200 or more submarines; a small seaplane carrier; and over 100 motor torpedo boats and motor launches. Vessels in the latter categories were divided between the Baltic, the Arctic, the Black sea and the far east.

Other European Countries.—The government of the Netherlands had at its disposal at the end of 1943 a total strength of 3 cruisers, 4 destroyers, 12 submarines, 3 sloops, 1 frigate, 1 corvette, 4 minelayers, 2 minesweepers, 10 torpedo boats (mostly of the modern motor type), a gunboat and a submarine chaser.

Norway retained under control of her government in London 4 destroyers, 2 large torpedo boats, 2 submarines, 4 corvettes, 8 patrol vessels, 8 motor torpedo boats, 4 motor launches, 1 submarine chaser and a number of small minesweepers.

The Danish fleet, with the exception of some small craft which had taken refuge in Swedish waters, was either under German control or lay scuttled in its home ports. Prior to Aug. 29, 1943, it had included 2 coast defense ships, 17 torpedo boats and 12 submarines. Two destroyers were nearing completion at Copenhagen.

Sweden for some years past had been carrying out a program of naval expansion. At the end of 1943 it possessed 2 cruisers, 7 coast defense ships, 24 destroyers and large torpedo boats, 26 submarines, 2 minelayers, 42 minesweepers, 17 motor torpedo boats, and a number of patrol vessels and fleet auxiliaries. Under construction were 2 cruisers, 2 destroyers and some smaller craft.

In the Finnish navy there remained a coast defense ship, 5 submarines, 10 coastal minelayers, 7 motor torpedo boats and some craft of less importance.

Poland had 1 cruiser, 6 destroyers, 5 submarines (3 of them interned), and 3 motor gunboats.

Spain could dispose of 6 cruisers, 16 destroyers, 8 submarines, 6 old torpedo boats, 6 minelayers and 2 sloops.

Portugal possessed 5 destroyers, 3 submarines, 1 large torpedo boat and 6 sloops.

Navies of the World as of December 1943

Country	Battleships and battle cruisers	Fleet aircraft carriers	Escort aircraft carriers	Cruisers	Coast defense ships	Destroyers and seagoing torpedo boats	Submarines

Peru	..	..	..	2	..	2	4
Colombia	..	..	..	..	..	2	..
Thailand	..	..	..	..	4	11	3

Owing to the war, figures relating to the first seven countries named above could not all be taken as exact. The navies of Denmark, Finland, Rumania, Yugoslavia and Thailand were under enemy control. Old torpedo boats no longer in seagoing condition, and motor torpedo boats (coastal craft) are not included in the above table. The two German "pocket battleships" are counted under the head of cruisers. French ships scuttled at Toulon have been omitted, for though they were lying in shallow water, they could not be made serviceable for a long time to come. This also applied to Danish ships scuttled in 1943. French, Italian, Norwegian, Danish and Yugoslav ships in enemy hands are not included in the figures for those countries. Russian figures have been estimated approximately in the absence of official information.

Turkey had an old battle cruiser, 8 destroyers, 12 submarines, 2 old cruisers used for training, 5 minelayers and 3 motor torpedo boats.

In the royal Hellenic navy were 1 old cruiser, 11 destroyers, 2 submarines, 4 corvettes, 1 submarine chaser and 3 old torpedo boats.

Rumania had 2 or 3 destroyers, 3 submarines, 1 minelayer, 1 motor torpedo boat and some old vessels of minor importance, all under German control. Bulgaria, also subservient to Germany, had 2 motor torpedo boats and some other small craft. In the Yugoslav fleet there were 3 destroyers, 4 submarines, 9 motor torpedo boats and sundry other ships of less importance. With the exception of one submarine operating with the Allies, all these were under Italian control up to Sept. 1943; some might since have fallen into Allied hands, while others might have been appropriated by the Germans.

South America.—In the Argentine navy at the end of 1943 were 2 old battleships, 3 cruisers, 15 destroyers, 3 submarines, 4 old coast defense ships, 14 minesweepers and some fleet auxiliaries. Two sloops under construction remained incomplete owing to non-delivery of their engines, ordered from Germany. In the Brazilian fleet there were 2 old battleships, 2 cruisers, 10 destroyers and seagoing torpedo boats, 4 submarines, 6 corvettes, 8 minelayers, 2 minesweepers and 11 submarine chasers. Six destroyers were under construction at Rio. Chile had 1 battleship, 3 cruisers, 8 destroyers, 9 submarines and 1 sloop.

Other South American navies possessed fleets of relatively small importance. Peru had 2 cruisers, 2 destroyers and 4 submarines. Colombia had 2 destroyers and 3 gunboats. Mexico's fleet comprised 5 sloops and some small patrol craft; Cuba had 2 sloops and some patrol vessels; Uruguay, 1 sloop and 3 patrol vessels; Venezuela, 4 gunboats; Ecuador, 3 or 4 patrol vessels; and Paraguay, 3 river gunboats. The Dominican Republic, Haiti and Nicaragua disposed respectively of 3, 2 and 1 patrol vessels.

Asia.—China lost the bulk of her navy in resisting Japanese aggression, but retained 12 small vessels, mostly river gunboats, of which 3 were presented by the British government and 1 by that of the United States. At Nanking was a quisling administration set up by the Japanese, which nominally disposed of 2 small cruisers, 1 sloop and 7 gunboats.

The Siamese navy—the term Thai, meaning free, can scarcely be applied to that country since it passed under Japanese domination—included 4 coast defense ships, 1 destroyer, 10 torpedo boats, 3 submarines, 2 sloops and 8 motor torpedo boats. Two cruisers ordered in Italy were never delivered, and were believed to remain incomplete. Manchuria, another Japanese vassal state, had an old destroyer and about 30 river patrol vessels. Persia, which under Riza was known as Iran, possessed 2 sloops and 4 gunboats, and Iraq 4 river patrol craft. (F. E. McM.)

Nebraska.

One of the states formed from the territory of the Louisiana Purchase, Nebraska lies in the lower Missouri valley in the west north central part of the United States; admitted to the union in 1867; land area, 76,653 sq.mi.; water area, 584 sq.mi.; pop. (1940) 1,315,834, a decrease of 62,129 from 1930; capital, Lincoln (81,984). In 1940, 39.1% of the population was urban. About 1% of the total population is Negro and about 8% foreign-born.

History.—Dwight Griswold, Republican, was re-elected governor of Nebraska Nov. 3, 1942, for the term 1943–45. Other state officers elected for 1943–45 were: lieutenant governor, Roy W. Johnson; auditor, Ray C. Johnson; secretary of state, Frank Marsh; treasurer, Carl G. Swanson; chief justice, Robert G. Simmons. Alone among the 48 states, Nebraska has a one-house legislature, the 43 members of which are chosen biennially on a non-partisan ballot.

Education.—Elementary and secondary education is largely under the control of local school districts, of which there were more than 7,000 in 1942, with but slight supervision by a state superintendent of public instruction. The total enrolment in elementary and secondary schools in 1942 was 257,664 and the teaching staff numbered 13,319. Expenditures amounted to $20,991,682.

Public Welfare, Charities, Correction.—The state appropriation for public assistance for 1943–45 was $23,765,490. In July 1943 the number of persons receiving general relief was 2,104 and the amount spent for the year ending June 30, 1943 was $837,557. At the same time, recipients of aid to dependent children numbered 8,204 and received during 1942–43, $1,660,228; 636 blind persons received $183,602. The state maintained 7 correctional institutions with a total of 1,097 inmates in June 1943 and 10 others for dependents with a population of 6,644; 3,278 inmates were on parole at the same date. The total appropriation for the 17 institutions for the period 1943–45 was $5,847,949.

Communication.—The total highway mileage of the state in 1943 was 100,987. Of this, 11,320 mi. had been designated as part of the state system of highways and 9,157 mi. had been marked and were maintained by the state. Of this latter figure, 3,984 mi. were hard surfaced, 4,915 gravelled and 258 of earth. State expenditures for highway purposes during 1941–43 amounted to $18,434,000 while the budget carried $10,447,250 for the biennium 1943–45. As of Nov. 1, 1942, there were 22 civil airports in the state, 20 of which were managed by municipalities, in addition to an undisclosed number of federally-maintained auxiliary landing fields. Total railway mileage in the state in 1943 was 8,457. Thirteen radio stations operated from points within the state in Nov. 1943, six of which were located in Omaha and Lincoln.

Banking and Finance.—State banks numbered 273, a decrease of six from 1942. Total assets in 1943 were $177,060,177. There were also 47 building and loan associations with assets of $57,914,372; and 175 co-operative credit associations with assets of $5,983,310. National banks at the same date numbered 132 with resources of $613,000,000.

The total assessed value of the state in 1943 was $2,123,882,890. The tax rate for state purposes was set at 2.48 mills, calculated to produce $5,059,841. Receipts for the biennium 1941–43 amounted to $82,538,264 including $18,179,140 of federal funds. Expenditures were $59,026,333. Total appropriations for 1943–45 were $54,257,727 including estimated federal funds of $15,191,571. There was no state tax on personal or corporate incomes or on sales. The state had no bonded debt, though that of the local subdivisions in 1943 amounted to $73,954,411. This figure did not include the indebtedness of the public power districts, which in 1943 amounted to more than $89,000,000.

Agriculture.—The total acreage harvested for the crops listed in Table I in 1943 was 15,624,000. In addition, an undetermined number of acres of wild hay was exploited. The total farm income in 1942 was $495,703,000, divided as follows: crops, $123,616,000; livestock, $335,648,000; government payments, $36,439,000. Agricultural income for the first half of 1943 was $307,825,000. A large annual deficiency in rainfall during the period 1931–41 was reflected in a sharp decline in the cash incomes of producers. Better growing conditions in 1942 and 1943

resulted in much larger yields.

Table I.—*Leading Agricultural Products of Nebraska, 1943 and 1942*

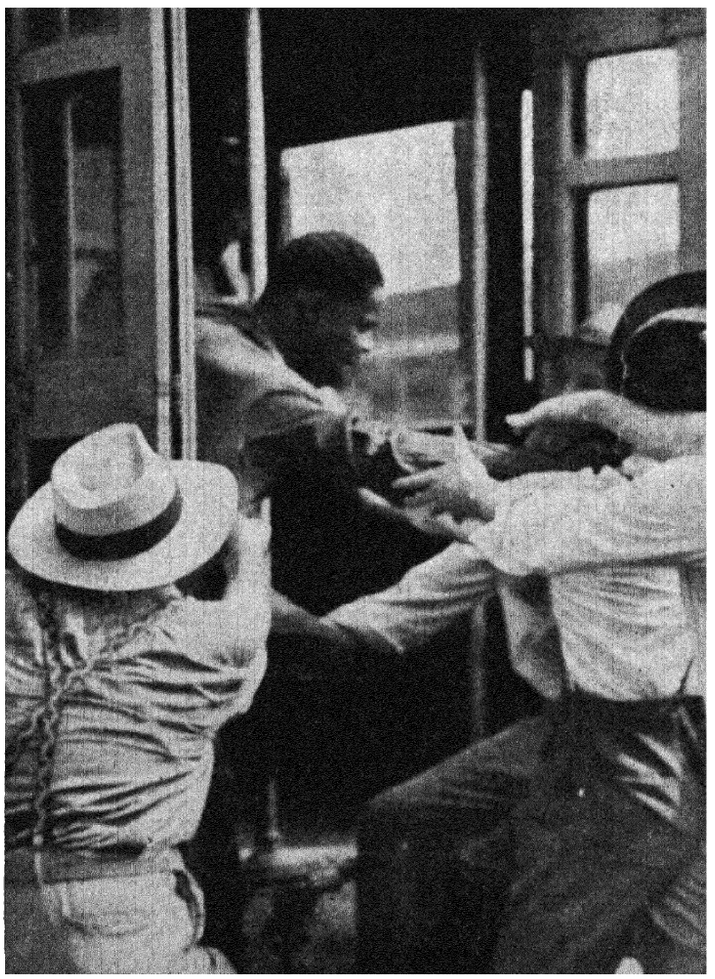
Crop	1943	1942
Corn, bu.	216,632,000	242,708,000
Wheat, bu.	61,285,000	69,908,000
Oats, bu.	71,676,000	58,278,000
Barley, bu.	27,918,000	38,258,000
Potatoes, bu.	12,090,000	12,876,000
Sugar beets, tons	568,000	930,000
Alfalfa hay, tons	1,343,000	1,593,000

Manufacturing.—The value of all manufactured products in 1939—the last year for which complete figures were available in 1943—was $273,524,500. In that year, 1,161 establishments employed 3,642 salaried persons and 18,810 wage earners and paid salaries and wages amounting to $28,135,500. World War II greatly increased manufacturing activity in the state, but no figures were available in 1943 as to the value of products or wages paid.

Table II.—*Principal Industries of Nebraska, 1939 and 1937*

Industry	Value of products	
	1939	1937
Meat packing	$117,743,570	$112,708,382
Creamery butter	21,133,891	23,291,846
Flour and mill products	17,485,317	25,524,100
Poultry dressing and packing	8,807,209	5,949,969

Mineral Production.—The state has no mineral wealth of consequence. Petroleum was discovered late in 1939 and by Nov. 1943, 87 wells had produced about 4,000,000 bbl. This, however, is not a significant part of the national output. (L. W. L.)



Necrology: *see* OBITUARIES.

Negroes (American).

Accelerated induction of Negroes into the armed forces during 1943 brought the Negro quota near to its population ratio; approximately 700,000 Negroes were in the army, of whom 5,000 were officers, including some 300 chaplains; 74,000 in the navy, 4 pursuit squadrons and 1 bomber fighter group in the air corps, and the 51st defense battalion in the marine corps. Integrated training was extended from officer-training centres to several army student training centres successfully, but in spite of continued public protests, the traditional policy of racial segregation was maintained elsewhere in the armed forces, resulting in sporadic disturbances in several of the camps in the U.S. and in England. The 99th pursuit squadron participated creditably in June in the North African campaign, in July in Sicily, and brigaded with the British 8th army took part in the Italian campaign. Its commanding officer, Col. B. O. Davis, Jr., relinquished command to Capt. Geo. Roberts, to return to the U.S. to take charge of the 332nd fighter group in training. Other combat units, like the 450th anti-aircraft artillery, saw action; others were ready for action —the 92nd and 93rd infantry divisions, the 795th tank destroyer battalion, the 931st field artillery battalion and the 349th coast artillery (AA); but public protests urged the increased employment of Negro soldiers in combat duty, although a number of quartermaster and transportation units served creditably in combat areas, with group and individual citations. In the merchant marine, integrated full quota employment continued successfully, with six Liberty ships, including the "Booker T. Washington," the "George Washington Carver," the "Frederick Douglass," and the "Paul Laurance Dunbar," named for outstanding Negroes, also the U.S. destroyer, "Leonard Harmon," named for a Negro cited for heroism in Pacific naval action.

Civil and Economic.—In war industry, increased pressure of the Fair Employment Practices commission, twice reorganized and implemented by another presidential order, No. 9346, raised the Negro quota of employment in war industries from 5.8% to 7.3%. But upgrading and merited entry to skilled classifications were not proportional. There was considerable employer and union opposition, notably, the citation of 21 railroads by the FEPC for discriminatory employment practices. Labour and residential friction also resulted in a number of race riots, the most serious of which occurred in Mobile; Detroit; Beaumont, Texas; and a Negro protest riot in New York city. Following these, there was marked effort to reduce friction through the appointment in many states and cities of bi-racial committees and inter-racial commissions. The war labour migration of Negroes was estimated at 800,000 and the rough gain in new job employment at 500,000. Increased tensions, coupled with considerable constructive effort to adjust them, carried race relations to a new prominence in public affairs and discussion. The anti-poll-tax fight, the Federal Education Aid bill and the soldier vote legislation all pivoted critically on the race issue. In politics, an increased number of Negro candidates were successful in municipal and state elections, including the re-election of a Negro to the New York city council, of Justice Francis Rivers to the city court of New York. The American Bar association revoked its colour bar by the election of Judge James Watson to membership, and James W. Johnson was appointed collector of internal revenue for the 3rd New York district. Truman Gibson Jr., succeeded William H. Hastie as civilian aide to the secretary of war, upon the latter's protest resignation from that position over the continued segregation of Negroes in the armed services. Hastie's protest was recognized by the National Association for the Advancement of Coloured Peo-

RIOTERS dragging a Negro from a streetcar during the Detroit race riot of June 20–22, 1943

ple's award of the Spingarn medal for 1943. State visits were made to the U.S. by the president and president elect of Liberia, and by President Lescot of Haiti, both of which set favourable precedents.

Educational and Cultural.—The *Crisis* annual survey reported 3,756 Negro college graduates, among them 3,185 from Negro schools with an enrolment of 27,273 students. Of these 358 received professional and higher degrees. Dr. W. E. B. DuBois, noted publicist and sociologist, was elected a member of the National Institute of Arts and Letters, the first Negro to be so chosen; and Marian Anderson, the singer, was awarded the Order of African Redemption by the Liberian government. Paul Robeson starred with sensational success in the role of Othello, produced on Broadway by Margaret Webster and the Theatre Guild. Roi Ottley's *New World A-Coming; Inside Black America,* won the $2,500 Houghton Mifflin Life in America series award, and had an unusual best-seller circulation. (*See* also LYNCHINGS.)

(A. LER. L.)

Nehru, Jawaharlal (1889–), Indian statesman, was born of wealthy parents and was educated in England at Harrow and Old Trinity college, Cambridge. Nehru learned to speak several Indian tongues fluently, and on his return to India he immediately took up the cause of Indian independence. He became a member of the All-India Congress committee in 1918, was arrested repeatedly for political offenses and was associated with the various civil disobedience movements in India after 1921. He was twice president of the Indian Congress party, 1929 and 1936, and was generally regarded as, next to Gandhi, the most important Indian leader. His autobiography, written in prison, was widely circulated in Great Britain and in the United States, where it was published under the title *Toward Freedom.* Nehru demanded for India, not dominion status, but complete independence. After the Japanese attack on Pearl Harbor, he came out for the Allied cause. He was nevertheless arrested and imprisoned, Aug. 9, 1942, along with Gandhi and a large group of Congress party leaders. William Phillips, special presidential envoy from the United States, tried to see him early in 1943, but was denied access. On April 22 a New Delhi federal court declared these political imprisonments without trial contrary to law. The British viceroy, however, overruled this court action. Nehru continued in prison, closely guarded, practically incommunicado.

Nelson, Donald Marr (1888–), U.S. business executive, was born Nov. 17 at Hannibal, Mo., and was graduated from the University of Missouri in 1911. The next year he was employed by Sears Roebuck and company as a chemical engineer. In 1927 he was appointed general merchandise manager of the company, in 1930 vice president in charge of merchandising, and in 1939 executive vice president and chairman of the executive committee. He served with the National Defense Advisory commission in 1940, and as director of purchases for the Office of Production Management in 1941. On August 28 of that year, President Roosevelt named Nelson executive director of the Supply Priorities and Allocations board. This agency was supplanted on Jan. 13, 1942, by the War Production board, with Nelson as chairman, and with authority over the whole war procurement and production program. Nelson's position, therefore, became the counterpart of Bernard M. Baruch's in World War I. During the next two years WPB had some difficulties, both with industry and with army and navy procurement agencies, but it maintained its dominant position. During 1942, as war production expanded and civilian production was curtailed, the problem of allocating materials became increasingly acute. A "controlled materials plan" was put into effect late in the year. On Nov. 11, Nelson named Ferdinand Eberstadt vice chairman of materials and Charles E. Wilson, former General Electric president, vice chairman of production. Friction developed. On Feb. 16, 1943, Nelson removed Eberstadt and concentrated the whole organization under Wilson as executive vice chairman. From then on affairs ran fairly smoothly. War production mounted steadily. By the end of 1943 the production battle was largely won. In late autumn Nelson visited Europe, where he conferred with Stalin and inspected Russian war plants. On Nov. 12, shortly after his return, Wilson resigned. Nelson accepted the resignation, but Pres. Roosevelt overruled him, and Wilson stayed on.

Nepal. An independent kingdom (area *c.* 54,000 sq.mi., est. pop. 5,600,000) lying between India and Tibet—and including Mt. Everest—ruled in fact by the prime minister, Maharaja Joodha Shamsher Jung Bahadur Rana.

Substantial help to the British war fronts continued to be given by the Gurkha regiments of the Indian army, their experience being especially valuable in the dense jungles of the Assam-Burma border. General officer commanding the Nepalese contingents in India was General Krishna Shamshere Jung Bahadur Rana.

Nepal continued a brisk trade with India in 1943, exporting chiefly hides, jute, tobacco and timber, and importing cotton goods, salt and metals.

The British envoy, Lt.-Col. G. L. Betham, resided at the capital Khatmandu (pop. *c.* 80,000).

Nervous System. Generally speaking the advances made in 1943, regarding the nervous system, were chiefly concerned with those problems found and met with in the prosecution of the war. These were:

Military Neuropsychiatry.—In the circular letter No. 176 released by the war department, psychiatric casualties in the combat zone fell into the following main groups: (1) Psychoneurosis under which are included anxiety, hysteria and psychasthenia; (2) psychoses; (3) psychopathic personality; (4) mental deficiency; (5) organic disease of the brain and spinal cord. In this letter the attention of all medical officers was invited to their responsibility for the mental as well as the physical health of the military personnel. Early recognition and treatment were stressed so that the individual could recover quickly whenever possible. Many involved persons recovered.

War Wounds of the Peripheral Nerves.—Most cut or injured nerves were treated surgically by uniting both cut ends by sutures. The injured limb was then immobilized so that the repaired nerve was not stretched. This method seemed to have produced the best results for nerve regeneration.

Treatment of Head Wounds Due to Missiles.—In a surgical division in the middle east an experience of two years in the treatment of missile wounds of the head revealed the following data: of 516 patients seen only 9% died while 71% returned to duty. A certain technique of surgical procedure resulted in a minimum amount of complications, infections and reduced time disability. The results were very gratifying.

Netherlands. A kingdom of northwest Europe. Bounded N. by the North sea, E. by Germany, S. by Belgium, and W. by the North sea. Occupied by German armed forces in May 1940. National flag, red, white and blue, in equal horizontal stripes. Area 13,440 sq.mi.; pop. (est. Dec. 7, 1941) 9,000,000. Chief towns (pop. Dec. 31, 1938): Amsterdam (cap. 793,526); Rotterdam (612,372); The Hague (pre-war seat of the government 495,518). Language: Dutch; religion: Christian (1930 census, Dutch Reformed Church 2,732,333; Roman Catholic, 2,890,022). Ruler: Queen Wilhelmina; president of the council of ministers, Prof. P. S. Gerbrandy.

History.—During the winter of 1942–43 the construction of defense works in the western part of the country, with the destruction of buildings and the evacuation of defense zones caused much hardship. The advertising of the East company continued; and subsidiary companies, for instance one for dredging and draining, were announced; but no more support was forthcoming than before. The main effort of the Germans was the forced deporting of labour. Shortly before the New Year it was announced that Mussert was to be leader of the Dutch people. A comprehensive decree on public order laid down the principles of a quasi-martial law which might be applied in an emergency. At the end of January Mussert announced the creation of a secretariat of state in which eight of his principal followers had functions in spheres of activity resembling those of government departments. This was not a puppet government, but an auxiliary machine to force the subjugation of the civil service, especially with a view to the deporting of labour. Professor Gerbrandy, the prime minister with the government in London, consequently broadcast an appeal to civil servants to resist the German measures. Popular indignation was expressed in attacks on the delegates. Within a few months of their appointment several of them were shot dead or died of wounds.

In the spring the Germans called up for labour all students except the small minority who signed a document of submission. On April 29 General Christiansen ordered all soldiers of the Netherlands army to report for re-internment as prisoners. The prime minister called upon them to disobey the order, which was furiously resented. A wave of strikes and sabotage spread through the whole country. Martial law was proclaimed and for a few days there was severe repression. After quiet had been restored, the Germans (as they had done earlier in Norway) forbade the use of wireless sets to any except their own supporters. In order to cut off listening to London they thus had to throw away the principal instrument of their own propaganda. In the summer a dispute with the medical profession marked the failure of the attempt to organize it on National Socialist principles. In September Roskam, the head of the agricultural organization, resigned, thus admitting his failure with the farmers. In October it was announced that the members of the N.S.B., the Dutch National Socialist party, who had hitherto been allowed to carry arms, were now to have arms issued to them. Terrorism thus worked towards a climax. On the other hand underground organizations flourished and there were many attacks on the N.S.B. besides acts of sabotage such as the destruction of registers needed for the labour call-up. Between July 1 and Oct. 6 the Germans announced 94 executions. (G. N. C.)

Education.—In 1938: elementary schools, 7,812; scholars, 1,242,778; secondary schools, 288; scholars, 62,301; high schools (1937–38), 4; scholars, 3,037; universities (1937–38), 6; scholars, 9,471.

Finance.—Revenue, ordinary (est. 1940) 741,096,000 florins; expenditure, ordinary (est. 1940), 740,548,189 florins; public debt (May 31, 1942) 7,449,000,000 florins; notes in circulation (Oct. 10, 1942), 2,724,143,000; gold reserve (Oct. 10, 1942), 917,809,474 florins; exchange rate (average 1940), 1 florin=53.19 U.S. cents.

Trade and Communication.—Trade (merchandise) imports, 1938: 1,414,768,000 florins; 1939: 1,516,651,000 florins; exports, 1938: 4,039,156,000 florins; 1939: 966,215,000 florins. Communications and transport, 1938: roads, suitable for motor traffic, 8,534 mi.; railways, open to traffic, 2,278 mi.; rivers and canals, navigable, 4,817 mi.; airways, distance flown, 6,629,000 mi.; shipping (June 30), 2,855,400 gross tons; launched (July 1938–June 1939), 246,400 gross tons; entered with cargoes, 27,606,524 net tons; cleared with cargoes, 23,151,428 net tons. Motor vehicles licensed (Aug. 1, 1938): cars, 94,000; buses, 4,088; trucks, 50,988; cycles, 55,140; wireless (June 30, 1939): registered receiving sets, 839,542; connections with radio-distributing systems, 368,710.

Agriculture, Manufactures, Mineral Production.—In metric tons (1939 actual figures): wheat, 416,523; rye, 603,532; barley, 146,041; oats, 449,241; pulse, 185,891; sugar beet, 1,716,052; flax, 152,487; cotton goods (1938), 136,565,000 guilders; machinery (1938), 99,821,000 guilders; coal, 12,861,000; salt, 199,800; pig iron and ferro-alloys (1938), 276,600; zinc, 20,500. (*See* also CURAÇAO; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES; SURINAM.)

Netherlands Colonial Empire. Total area excluding mother country (approx.) 789,700 sq.mi.; total pop. excluding Netherlands (est. Dec. 31, 1940) 70,760,000.

The table on p. 493 lists the colonial possessions of the Netherlands, together with statistics appropriate to each of them.

History.—During 1943 considerable progress was made in economic reconstruction and organizing the war effort in the part of Dutch New Guinea still in Dutch control. Civilian conscription and training schemes were introduced; and the various races of the island, including the Papuans, showed a gratifying spirit of co-operation. Authentic news from the great areas of the Netherlands Indies occupied by the Japanese was scanty. Economic conditions were certainly bad. There were shortages of food and clothing and much unemployment. Rice was rationed; but, by pressing for the growing of war materials such as cotton instead of food crops, the Japanese made the situation still worse. Their attempts to win over the peoples to voluntary collaboration were unsuccessful. It appears, for instance, that only 39 British Indians enlisted in Chandra Bose's "Independence army." Soekarno, whom the Japanese appointed "Leader" of the occupied territories, set up a number of bodies such as a defense corps and a women's defense corps in which his followers were enrolled.

A pretense was made of granting self-government to the Indonesians. An advisory council for Java was set up, of which all the members were Indonesians, together with 7 provincial councils and one for Batavia; but 23 of the 43 members of the council for Java were nominated, while the 18 elected members were elected only by the provincial councils of which, in turn, half the members were nominated. In October an industrial council was established with the object of co-ordinating industry for the purposes of the Japanese in the war. About the same time another measure was taken which indicated greater pressure on manpower: all Indo-Europeans were ordered to register. Javanese labour was deported for mine work in Borneo.

The Japanese appear to have been disappointed with the results of their efforts. They seem to have obtained no appreciable quantity of oil. Early in the year they strengthened their control by adding civilian administrators to their naval and military

headquarters, and there were some executions. In July Premier Hideki Tojo paid a two-day visit to Java. The administration continued to be under the Great Asian Affairs department of Aoki. Throughout the year the Netherlands West Indies cooperated smoothly in the United Nations war effort.

(*See* also CURACAO; NETHERLANDS INDIES; SURINAM; WORLD WAR II.) (G. N. C.)

Netherlands Indies. This, the largest Netherlands colonial possession, was in 1943, and had been since March 1942, under Japanese military occupation (except for part of New Guinea). The Netherlands Indies is a huge archipelago, with several very large islands, Java, Sumatra, Celebes, Borneo and New Guinea (part of Borneo is British and the eastern half of New Guinea is under Australian administration), and many smaller ones. The archipelago is located between 6° N. and 10° S. latitude and the climate is tropical. Area, 733,681 sq.mi.; pop. (census of 1930) 60,727,233; (est. 1940) 70,476,000, of whom 48,416,000 lived in densely settled Java and the adjacent small island of Madura, while 22,060,000 lived in the so-called Outer Islands, the less settled and developed regions of the archipelago. Capital, Batavia (437,000). Other large cities: Surabaya (313,000); Bandung (167,000). The great majority of the natives are Moslems, although an admixture of Hindu and pagan practices is found in some regions. There are about 2,500,000 Christians, about 1,000,000 Buddhists and a number of Animists. Governor general (appointed in 1936) until the Japanese occupation: Jonkheer A. W. L. Tjarda van Starkenborgh-Stachouwer.

History.—Except for occasional air raids on outlying stations, the Japanese occupation was not disturbed during 1943. The objectives of the occupation authorities were apparently to create a semblance of political support among the natives, to Japanize the administration and the educational system, to bring in Japanese banks to assist in financing operations, to make the economy more self-sufficient and to make preparations for possible United Nations attacks, especially in Sumatra, exposed to air and naval offensives launched from India.

Telephone conversations in Java were permitted only in Japanese or Malay, Dutch and English being barred. Japanese language schools with six-year courses were started for Indonesian children in April 1943. Radio telephone service between Macassar, on the island of Celebes, and Tokyo was opened on Feb. 1. The streets of Macassar were given Japanese instead of Dutch names.

Japan announced a program of "autonomy" for the Netherlands Indies in August 1943. Its main feature was the establishment of "a central council which will have the right to advise and submit proposals connected with administrative affairs to the Japanese military authorities." Elections for regional and municipal councils of the same type were held in September.

Japanese broadcasts in Oct. 1943 indicated that Indonesians were being urged to join a "defense corps" that would relieve the Japanese army of police duties. There were attempts to recruit Indonesian labour on a large scale for shipbuilding in Batavia and for the repairing of roads and other transportation facilities in Sumatra. The Japanese slogan of "co-prosperity" was at least temporarily shelved in favour of self-sufficiency, because shipping difficulties prevented a normal exchange of goods among the far-flung territories of Japan's newly conquered empire. In normal times the Netherlands Indies had exchanged large surpluses of such raw materials as rubber, tin, tobacco, coffee, quinine, etc. for manufactured goods from abroad. In 1943 the Japanese apparently found the surplus stocks of rubber and tobacco an embarrassment and tried to put the archipelago on a more self-sufficient basis by substituting rice for rubber and some other export crops in some cases. There was also a shortage of new clothing, because of the lack of cotton and the inability of the Japanese to bring in textile goods from Japan in any large quantity.

The Netherlands Indies authorities established a school for civil servants in Melbourne, Australia, under the direction of Prof. Frederik David Holleman, in July 1943. The minimum training course was six months; the subjects taught included Malay language and dialects, Islamic institutions and Malay social institutions and traditions. The purpose of the school was to train civilian administrators qualified to take over after Allied reoccupation of the Indies. A commission, appointed by the governor general before the Japanese invasion, and headed by F. H. Visman, was working on constitutional projects which would make the Netherlands Indies in the future more independent of direct control from the Netherlands and would broaden the previous suffrage qualifications, although the Netherlands Indies still was considered an inseparable part of the Netherlands empire.

Education.—In Aug. 1943 there were 12,000 elementary schools in the Netherlands Indies, with 1,900,000 pupils, besides 32 secondary schools, five high schools, 20 vocational schools, one agricultural college, 7 fine-art schools for girls, one normal college, one medical college and one technical college, according to a statement of the Japanese Domei News agency. Dutch sources asserted that under the Netherlands administration there were more than 20,000 native schools with over 2,500,000 pupils, besides 628 western schools, with 150,000 pupils; 7.2% of the population was literate in 1930.

Finance.—The Japanese yen was introduced as the currency of the Indies during 1943 and was given an arbitrary value of parity with the Dutch guilder, the former unit of currency. (Formerly the yen had been worth .44 guilders.) The Java bank, which had formerly controlled the note issue, and all other Dutch financial institutions were liquidated. The Bank of Japan, the Yokohama Specie bank, the Bank of Taiwan and the Mitsubishi bank began to operate in the Netherlands Indies. The last Dutch budget, of 1942, called for revenue of 750,918,773 guilders and expenditures of 813,802,815 guilders.

Trade and Communication.—Imports in 1940 were 444,300,000 guilders (value of the guilder 53 U.S. cents); exports were 873,500,000 guilders. The principal exports in 1940 were rubber (328,254,000 guilders), oil and petroleum products (169,577,000 guilders), tin and tin ore (72,218,000 guilders), sugar (52,041,000 guilders), tea (50,925,000 guilders).

There were, in 1940, 43,450 mi. of highways and 4,620 mi. of railways, 3,387 in Java, 1,233 in Sumatra. There were 94,000

motor vehicles of all types in 1941; 10,870 steamers, with a total tonnage of 12,456,664, cleared from the ports of the colony in 1939. The Royal Netherlands Airways was formerly one of the main lines of air communication between Europe and the orient.

Agriculture.—Figures of production for some of the principal crops, in 1940, were as follows: sugar, 1,587,364 tons; rubber, 546,021 tons; palm oil, 241,702 tons; tea, 81,986 tons; coffee, 77,647 tons; tobacco, 27,414 tons; quinine, 16,371 tons; cocoa, 1,553 tons.

Manufacturing and Mineral Production.—Although the Netherlands Indies had always been primarily a source of raw materials, local industries were encouraged during the '30s and gained stimulus when the outbreak of World War II in 1939 cut off or curtailed the supply of imported manufactures. Among these local industries were batik, spinning and weaving, tobacco, ceramics, paint, soap, chemicals, cement, wood, glass and paper. Figures of output for the principal mineral products in 1939 were as follows: oil, 7,949,000 tons; tin, 31,000 tons; coal, 1,781,000 tons; gold, 2,500 tons; silver, 19,200 tons. The Japanese made special efforts to restore oil production, in view of the deficiency of this vital fuel in Japan. (*See* also JAPAN; NETHERLANDS COLONIAL EMPIRE.) (W. H. CH.)

Neutrality: *see* INTERNATIONAL LAW.

Nevada. A far western state of the U.S., admitted to the union Oct. 31, 1864. Popular name is the "Sagebrush" state. Area 110,540 sq.mi., including 738 sq.mi. of water. Pop. (1940) 110,247. The population in 1943 was estimated at 141,813, the increase being due to the establishment of wartime industries in Mineral and Clark counties. Of the population 39.3% were urban; 93,431 were native white; only 10,599 were foreign-born white. Capital, Carson City (2,478); other cities: Reno (21,317); Las Vegas (8,422); Sparks (5,318).

History.—The forty-first session of the legislature in 1943 was featured by legislation retiring all outstanding bonds and the creation of a million dollar postwar fund. Other acts passed by the legislature in 1943 included the following: the Flight Strip act, authorizing the department of highways to co-operate with the Public Roads administration of the U.S. in the construction and maintenance of flight strips and of certain classes of highways; the Nevada State Police act, which provided for the creation and organization of a Nevada state police force consisting of one inspector, 3 sergeants, 5 subordinate police officers and 250 reserves.

In 1943 the elected officers of the state were: governor, E. P. Carville; lieutenant governor, Vail Pittman; secretary of state, Malcolm McEachin; attorney general, Alan H. Bible; state treasurer, Dan W. Franks; state controller, Henry C. Schmidt; superintendent of public instruction, Mildred Bray. Chief Justice of the state was William E. Orr.

Education.—In 1943 there were 210 elementary schools with a total enrolment of 19,367 pupils, staffed by 696 teachers. On Jan. 1, 1944 there were 46 high schools with a total enrolment of 6,237 pupils, staffed by 299 teachers. On Jan. 1, 1944 the total school enrolment was 26,866, including 1,262 kindergarten pupils.

Public Welfare, Charities, Correction.—The amount spent for social security and old-age assistance was $843,151.17. For the year ending Dec. 31, 1943, the state spent $39,520.00 for unemployment compensation. On Jan. 1, 1944 the state prison had 241 inmates, 4 of whom were women; total expenditures of the fiscal year ending June 30, 1943, were $97,002.27. The state industrial home had 50 inmates; expenditures $20,761.26; the state hospital for mental diseases had 344; expenditures were $99,968.92; the orphans' home had 45 inmates on Jan. 1, 1944. and expended $37,239.86 during the fiscal year.

Communication.—There were 5,518 mi. of roads in the state-designated highway system in 1943, 3,064 of which were hard-surfaced and approximately 2,500 improved but not paved. On Jan. 1, 1944, there were 11 standard airports reservations.

Banking and Finance.—On. Jan. 1, 1944, there were four state banks. The Nevada Bank of Commerce at Elko had in addition two branches; total deposits as of Oct. 1943 were $11,825,089.63. total resources $12,619,700.21. The First National Bank of Nevada had nine branches, with total deposits as of Jan. 12, 1944, of $74,812,126.54 and total resources of $78,083,814.85; the Ely National bank with one branch had total deposits as of Oct. 1943 of $73,119,157.82 and total resources of $77,707,771.72. State receipts for the year ending June 30, 1943, were $8,082,529.74, and expenditures $6,934,915.92. On Jan. 10, 1944. the cash balance was $2,685,898.05. The postwar fund totalled $1,092,000.00, and Nevada's assessed valuation for 1943 was $241,094,990, an increase of $19,862,458 over 1942. Nevada had no state debt in 1943.

Agriculture.—Nevada's wartime agricultural production for 1943 exceeded the five-year average annual production for 1937–1941. On this comparative basis the wheat acreage showed an increase of 11%; corn acreage an increase of 33%; acreage in oats an increase of 50%; acreage in barley an increase of 67%; acreage in potatoes an increase of 100%. Crops harvested in 1943 were valued at approximately $12,990,000 as compared with $9,500,000 in 1942.

Table I.—*Leading Agricultural Products of Nevada, 1943 and 1942*

Crop	1943 (est.)	1942
Barley, bu.	984,000	828,000
Potatoes, bu.	585,000	403,000
Hay, tons	603,000	636,000
Oats, bu.	320,000	320,000
Wheat, bu.	548,000	484,000

The state's barley production was by far the heaviest crop ever produced in the state; the production of potatoes was the largest since 1930. Marketing of surplus cattle greatly increased in 1943, and the condition of the state's herds of cattle was reported by the U.S. department of agriculture as well above the average for the preceding 10-year period. Above-normal precipitation was enjoyed during the year 1943 on most of the Nevada range.

Manufacturing.—The total value of manufactures in 1941 was $20,582,000. The number of employees was 1,093 and the total wages paid was $1,000,642. The number of manufacturing establishments was 105 and the principal manufactures were printing products; brick, clay and iron and steel products; and automobile parts.

Mineral Production.—The total value of gold, silver, copper, lead and zinc production in 1943, as reported by the U.S. bureau of mines, was $27,770,047. Gold, silver, lead and copper decreased, zinc alone showing a large increase.

Table II.—*Principal Mineral Products of Nevada, 1943 and 1942*

Mineral	Value, 1943	Value, 1942
Gold	$4,830,000	$10,328,920
Silver	1,105,777	2,047,776
Copper	18,083,000	20,246,446
Lead	708,180	720,384
Zinc	3,043,090	1,896,642
Totals	$27,770,047	$35,840,168

Nevada produced magnesium in substantial amount. An increase in the production of tungsten, mercury and vanadium was noted. Tin was produced in small quantities. Gypsum, fluorspar

and coal developments created interest. Gem-stone production increased, with turquoise in active demand. (E. C. D. M.)

New Brunswick. One of the three maritime provinces of the dominion of Canada (*q.v.*), admitted to the union in 1867; area 27,985 sq.mi.; pop. (1941) 457,401, of whom 97% were native born. Capital, Fredericton (10,062). Other cities are Saint John (51,741) and Moncton (22,763). The lieutenant governor in 1943 was W. G. Clark and the premier was J. B. McNair.

Education.—The number of students in provincially controlled public schools in 1942 was 96,470; in private schools, 3,015; in institutions of university standard, 1,297.

Communication.—The mileage of surfaced highways in 1942 was 8,455; earth highways 3,840; provincial expenditure on highways, $1,193,404. The railroad mileage was 1,848 in 1942; the number of telephones, 35,798.

Finance.—The ordinary receipts in 1942 were $12,459,611; expenditure, $11,921,467. The direct debt (less sinking funds) was $97,043,223; indirect liabilities (less sinking funds) $2,741,509.

Agriculture.—The acreage of field crops in 1943 was 922,700; gross values of field products, $28,497,000.

Leading Agricultural Products of New Brunswick, 1942 and 1941

Crop	1942	1941
Oats, bu.	6,895,000	5,983,000
Potatoes, cwt.	6,818,000	5,736,000
Turnips, cwt.	3,157,000	3,034,000
Hay and clover, tons	970,000	880,000

Manufacturing.—The gross value of manufactured products in 1940 was $89,281,008; net value, $38,253,475; number of employees, 16,859; salaries and wages, $17,639,789. (J. C. He.)

New Deal: *see* United States.

Newfoundland and Labrador. A British colony of North America, with suspended constitution. Area: Newfoundland 42,000 sq.mi.; Labrador 110,000 sq.mi.; total 152,000 sq.mi.; pop. (est. Dec. 31, 1938): Newfoundland, 290,660; Labrador, 4,780. Chief town and capital: St. John's (pop. 1941: 39,886). Governor (1943): Sir Humphrey Walwyn; language: English; religion (1935 census): Roman Catholic, 93,925; Church of England, 92,732; United Church, 76,100; Salvation Army, 18,054.

History.—Work on defense projects undertaken by the U.S. and Canadian armed forces continued to bring unprecedented prosperity to Newfoundland in 1943 and almost doubled the national income. A wartime boom in the fishing industry also helped to solve the unemployment problem, and, apart from a temporary stoppage in one of the mining operations, due to a shortage of shipping, there was no able-bodied relief throughout the year. Moreover there were more than 10,000 men serving abroad, and one Newfoundland regiment was in action in Tunisia.

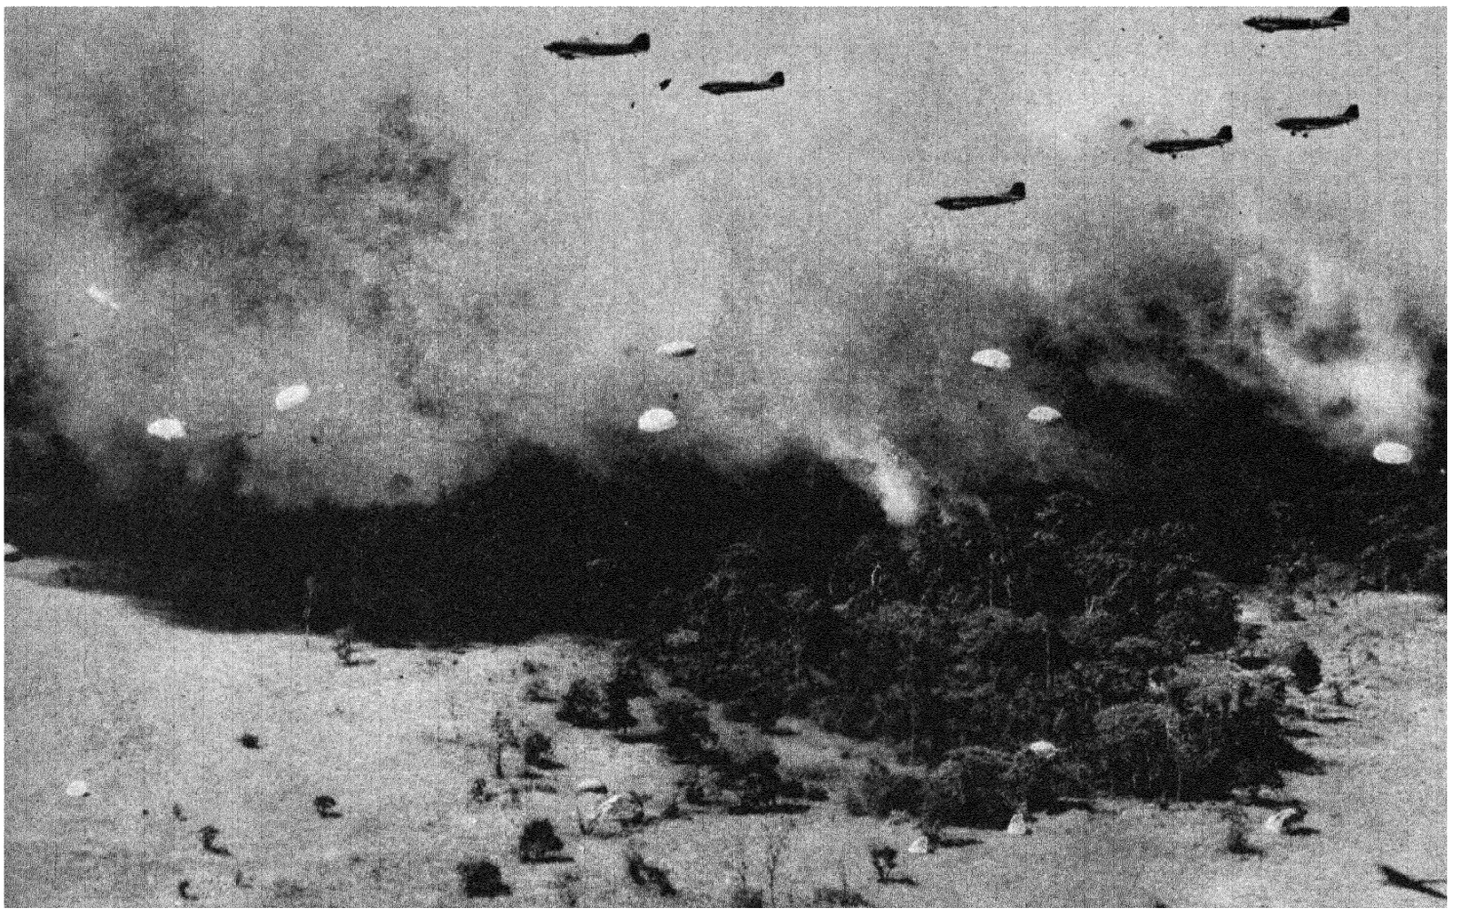
Higher wages and the danger of a considerable shortage of essential supplies set the cost of living rising, and steps to deal with this were announced by the public welfare commissioner on Feb. 15, including the removal of the import duty on potatoes, remission of the 7½% war import duty on about 80 essential foodstuffs and other commodities such as medical supplies and fishing equipment, and fixing the price of tea and molasses (both rationed). Coal rationing was also imposed on Feb. 10.

A revenue surplus of $3,681,650 was announced in the budget speech of April 27; owing to the alteration of the financial year to end on March 31, the period under review was one of nine months only. From the previous three years' surpluses interest-free loans of some $6,500,000 had been made to Britain for the duration of the war, in addition to $1,200,000 from the sale of savings certificates.

Considerable dissatisfaction was felt during the year with the commission government, and on March 8 the board of trade passed resolutions protesting against the new income and profits tax proposals and demanding a return to some form of representative government. A petition, backed by many sections of the community, was later sent to the king, requesting the appointment of a royal commission to inquire into the island's constitutional and financial position. The dominions secretary stated in parliament on June 10, however, that, during his visit to Newfoundland in 1942, he had found that the main body of opinion there considered it inexpedient to carry out constitutional changes in wartime. (C. M. Cl.)

Education.—In 1940: schools 1,898; scholars on rolls 66,508; average attendance 70.2%.

Banking and Finance.—Revenue, est. (1942–43) $18,744,100; expenditure, est. (1942–43) $17,722,300; public debt (June 30, 1941) $2,412,773 and £19,980,012; notes in circulation (June 30, 1941) $13,535; exchange rate as Canadian dollar.



Trade and Communication.—Overseas trade 1940–41 (merchandise) imports $35,484,323; exports $36,723,352; re-exports $606,463. Communications (Dec. 31, 1938): roads, main 1,150 mi.; secondary and local 6,000 mi.; railways, open to traffic 747 mi.; motor vehicles licensed (1940) 10,588.

Mineral Production and Fisheries.—Fisheries 1940: cod (inshore, deep sea and Labrador) 87,549 metric tons; seal $205,030; salmon (export) 3,750,336 lb.; lobster (export) 2,477,289 lb.; fish oils (export) 1,826,377 lb. In metric tons (1940): wood pulp (1938) 242,000; iron ore (metal content) 797,000; lead ore (metal content) 25,500; silver 46.5; gold 678 kg.

New Guinea. One of the largest islands in the world, with an estimated area of 312,329 sq.mi., stretching from the equator in the N.W. to 12° 5′ S. in the S.E. and from 130° 50′ E. to 151° 30′ E., separated from Australia by the shallow Torres strait and Arafura sea. On its eastern side lies the Bismarck archipelago.

New Guinea is divided between three administrations: (1) Dutch New Guinea, area 151,789 sq.mi.; pop. (est.) 195,460, of whom 237 were Europeans (1940) (*see* Netherlands Indies). (2) British New Guinea (Territory of Papua), area 90,540 sq.mi., pop. 338,822 (1940) is under the governor-general of Australia, with a lieutenant governor of its own and a centre of administration at Port Moresby. It comprises roughly the southeastern corner of the island and is an exporter of rubber and copra, while copper is mined in the vicinity of Port Moresby. (3) Northeastern New Guinea and the adjacent islands of the Bismarck archipelago, including Bougainville and Buka in the northern Solomons, were German colonial possessions before World War I. After Dec. 17, 1920, this area was administered by Australia under a mandate from the League of Nations. Area 93,000 sq.mi.; pop. (1940) 668,871 natives, besides an unknown number in the unexplored interior; 6,498 non-natives, including 3,345 British, 2,061 Chinese, 430 Germans, 159 Dutch, 145 Americans, 38 Japanese. Administrator of the mandated territory in 1943 was Brig. Gen. Sir Walter Ramsay McNicoll (appointed Sept. 13, 1934). The headquarters of the administration are normally at Rabaul.

History.—In the course of their invasion of the South Pacific the Japanese occupied all the foreign settlements in the mandated territory and established their main advanced base in the South Pacific at Rabaul, where the Germans had formerly de-

Above: U.S. PARACHUTE ATTACK in Japanese-held Markham valley of New Guinea Sept. 5, 1943, shielded by a smoke screen (background). In this official air force photograph, scores of paratroopers are shown jumping at low altitude from C-53 transport planes, at the height of the attack

Below, left: AUSTRALIANS entering a U.S. "LST" (landing ship—tank) for transport to Lae, New Guinea, where they landed Sept. 4, 1943

Below, right: U.S. SOLDIERS BATHING in water-filled shell holes at Buna mission a few hours after capturing this Japanese stronghold in New Guinea in the first week of Jan. 1943

veloped a good harbour, on New Britain Island. At the high tide of the Japanese advance in this area, in the autumn of 1942, their troops crossed the high Owen Stanley range, which cuts across New Guinea in a northwestern-southeastern direction, and threatened Port Moresby, the last important United Nations base north of Australia. However, U.S. and Australian troops under the command of Gen. Douglas MacArthur checked this advance and, making skilful use of airborne troops, took the offensive in turn, driving the Japanese in 1943 from such bases as Lae, Salamaua and Fischhafen and, toward the end of the year, effecting a double landing on New Britain with the apparent purpose of pressing on toward Rabaul, which was threatened from another direction by landings of U.S. forces under the command of Adm. William F. Halsey on Bougainville, in the northern Solomons.

Agriculture, Mineral Production, Trade.—As might be inferred from the small number of foreign residents, economic development has been slight. The total area under cultivation in 1940 was 276,000 ac., although it is estimated that the mandated territory contains about 34,200,000 ac. of land suitable for cultivation. Much the greatest part of the cultivated area was under coco-nut plantations and copra was the main product and export. The territory produced 73,716 tons of copra, of a value of £A.847,734 in 1938. Secondary crops, the output of which is of minor importance, are cocoa, coffee, rubber, kapok and tobacco. Gold, silver and platinum are mined, the first being the most important mineral product. The foreign trade of the mandated territory was £A.1,610,967 in imports, £A.2,980,360 in exports in 1938.

Social and Economic Changes.—Although New Guinea may still be considered one of the most remote parts of the world, the total isolation from foreign contacts in which most of the natives lived in the past began to break down under such varied pressures as the activity of the missions, the increasing area patrolled by government officials and the growing demand for native labour on the plantations. There were ten missions (three Roman Catholic, three Lutheran, two Methodist, one Anglican, one Seventh Day Adventist), with a combined staff of more than 600, in New Guinea in 1938. There were 41,849 natives in indentured service in 1938, 20,855 on plantations, 7,189 on mines, 7,511 in shipping, commerce and industry, 4,477 in domestic service, 1,747 in administration service and 70 in miscellaneous occupations. There were also 883 native members of the police force. World War II brought further changes and upheavals to this remote region; and the primitive Melanesian natives were used as bearers and for labour service by both sides. (*See* also WORLD WAR II.) (W. H. CH.)

New Hampshire.

One of the New England group of states and one of the original states of the union, popularly known as the "Granite state"; area, 9,304 sq.mi., including 9,024 sq.mi. of land and 280 sq.mi. of water; population (1940) 491,524. Of the total population, 283,225 or 57.6% were urban and 208,299 rural. Total estimated civilian population Mar. 1, 1943, was 454,490. In 1940 there were 490,989 whites, including 422,693 native and 68,296 foreign-born. Capital, Concord (27,171). Other cities: Manchester (77,685), Nashua (32,927), Berlin (19,084), Dover (14,990), and Portsmouth (14,821).

History.—The general court was in session from Jan. 6 to May 20, 1943. Measures passed included an act granting broad emergency war powers to the governor and council; an act creating a state veterans council, to aid returning soldiers and to ensure them preference in public employment; and an act providing for a soldiers' bonus, to be paid any resident of the state serving more than 90 days in the armed forces, such bonus to amount to $10 a month for each month of service, the total not to exceed $100. To finance bonus payments, the existing poll tax was increased by $3.

State officers in 1943 were governor, Robert O. Blood; secretary of state, Enoch D. Fuller; state treasurer, F. Gordon Kimball; commissary general, Charles F. Bowen; and acting attorney general, Stephen M. Wheeler, all Republican.

Education.—In 1942–43, there were 1,812 public schools, classified as follows: kindergartens 46; mixed schools 273; classified schools 1,311; junior high schools 44; senior high schools 95; opportunity schools 15; evening schools 28. The total number of elementary pupils was 50,241, with 2,114 teachers; the number of high school pupils 19,537, with 1,006 teachers. Total payments for public education during the year ending June 30, 1943, were $7,650,635. Owing to the loss of several hundred teachers because of war conditions, a critical shortage developed during the course of the year 1942–43.

Public Welfare, Charities, Correction.—The burden of general relief showed a continued downward trend during 1943 because of increased opportunities for employment. In Sept., 1942, there were 4,259 cases on general relief, with an expenditure of $107,112, as compared with only 3,059 cases in Sept. 1943, with an expenditure of $84,449. Expenditures for public assistance under the Social Security act continued to increase, the total for Sept. 1943 being $241,322, as compared with $224,087 for Sept. 1942. By far the greatest part of this increase was in the category of old-age assistance, aid to dependent children and needy blind showing little change.

On Jan. 1, 1940, there were 259 persons in prison and reformatory in New Hampshire. The appropriation for the state prison at Concord for the fiscal year 1943–44 was $182,791; and for the Industrial School for Committed Minors at Manchester, $93,555.

Communication.—Rural highways and urban extensions amounted to 3,635 mi. at the close of 1940. State highway funds disbursed in 1941 totalled $8,743,000. In 1940 there were 1,002 mi. of steam railroads in the state.

Banking and Finance.—As of June 30, 1943, there were in New Hampshire 52 national banks with deposits of $118,217,000 and resources of $133,888,000, as compared with deposits and resources, respectively, on June 30, 1942, of $93,734,000 and $108,971,000. Fifty-five state-chartered banks reported deposits of $229,263,187.48 and resources of $257,217,137.66. There were 25 building and loan associations with total resources of $13,980,-803.90. Forty-three savings banks and savings departments of eight trust companies reported deposits of $220,086,300.91 as of June 30, 1943.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1943, $25,862,337.04; cash disbursements, $26,114,254.01; cash balance, June 30, 1943, $5,151,940.36. Gross fixed bond and note debt, June 30, 1943, $14,135,000; net fixed bond and note indebtedness, $11,543,408 25 Average property tax rate for 1943 was $30.30 per $1,000 of assessed valuation.

Agriculture.—The principal crops showed declines in yields in 1943, with the exception of potatoes and corn, as shown in the table.

Manufacturing.—Total estimated value of manufactures in

Leading Agricultural Products of New Hampshire, 1943 and 1942

Crop	1943 (est.)	1942
Corn, bu.	630,000	630,000
Oats, bu.	266,000	273,000
Tame hay, tons	413,000	425,000
Potatoes, bu.	1,402,000	1,088,000
Apples, bu.	778,000	961,000
Maple sugar, lb.	...	44,000 (est.)
Maple syrup, gal.	...	66,000 (est.)

1939, last federal biennial census before World War II, was $237,396,015. Salaried personnel, including officers and employees, 4,593; salaries, $10,483,983; wage earners 55,781; wages paid $52,735,240. War industries led to rapid population increases in some communities, Portsmouth, Somersworth, Laconia and Claremont having been particularly affected.

Mineral Production.—Total value of minerals produced in 1940 was $1,065,000 (estimated). Mica mining on a substantial scale was resumed in New Hampshire in 1942, to help in meeting war requirements. (W. E. Ss.)

New Hebrides: *see* PACIFIC ISLANDS, BRITISH; FRENCH COLONIAL EMPIRE.

New Jersey. Sometimes called the "Garden state," New Jersey is one of the three middle Atlantic states. Area, 7,836 sq.mi., including 314 sq.mi. of water; pop. (1940) 4,160,165. Capital, Trenton (124,697). The largest city is Newark (429,760); second is Jersey City (301,173).

History.—The elections of 1943 completed the Republican conquest of major elective offices in New Jersey. Walter E. Edge was elected to the governorship by a majority of 127,000 over Mayor Vincent J. Murphy of Newark, the Democratic nominee. The Republicans retained control of the legislature by overwhelming majorities in both branches, the assembly standing 44 Republicans to 16 Democrats and the senate 18 Republicans to three Democrats. In December the death of United States Senator W. Warren Barbour left the Democrats in possession of this office by virtue of the appointment by Governor Edison of Arthur Walsh of South Orange to the vacancy. The 1943 elections also marked the first concrete step toward the adoption of a new constitution for which an intermittent fight had been waged since the governorship of Woodrow Wilson. A referendum was adopted by a majority of 154,000, directing the 1944 legislature to write a new constitution, retaining the state bill of rights, for ratification or rejection at the 1944 general election. The referendum was opposed by Mayor Frank Hague of Jersey City, Democratic state leader, and by rural politicians on the ground that no change in the constitution should be ordained until the war was over. The gubernatorial and legislative campaigns found the Democratic party weakened by the Edison-Hague feud. Mayor Hague had tried without success to persuade A. Harry Moore, three-time governor, to run again as the Democratic nominee. Three weeks before the deadline for filing nominating petitions, Mayor Hague turned to Mayor Murphy and agreed to support him. Governor Edison did likewise. Mayor Murphy was supported also by the C.I.O. and the leaders of the railway unions. Edge, backed by a united party which averted a primary contest for the nomination, carried 18 of 21 counties. Mayor Murphy won only in Camden, Middlesex and Hudson, the home of the Hague organization, and by reduced majorities.

During 1943 the validity of the railroad tax legislation, which had brought the Edison-Hague break into the open, was attacked in the court of chancery, and Vice Chancellor Wilfred H. Jayne ruled that it was unconstitutional because it remitted interest amounting to more than $20,000,000. The case against the railroad legislation was prosecuted by Attorney General Wilentz and was defended by special counsel authorized by the legislature to act for the state treasurer. An appeal from the chancery decision was taken immediately to the court of errors and appeals.

Education.—For the fiscal year 1941–42, total enrolment of day students in public schools was 719,623, a decrease of 13,326. Teachers numbered 29,513. Total salaries were $61,673,907, averaging $2,123 a year. Total school buildings numbered 2,090.

WALTER E. EDGE, Republican, was elected governor of New Jersey Nov. 2, 1943

There were 19,345 adults given instruction in various war training programs by 451 teachers. Total cost of the public school system was $108,607,744.

Public Welfare, Charities, Correction.—Direct relief commitments by the state to municipal governments for the first ten months of 1943 totalled $2,110,341 as against $4,556,177 in 1942.

In 1943 the number of relief cases fell below 12,000 for the first time since public assistance reports for the state at large have been available.

Communication.—Although highway construction was curtailed because of the war, the state had at the end of 1942 more than 1,680 mi. of paved roads, many of six lanes. In 1939 there were 2,123 mi. of steam railways in New Jersey.

Banking and Finance.—The 158 financial institutions under jurisdiction of the state department of banking and insurance reported total deposits, at the close of the state's fiscal year June 30, 1943, of $1,766,751,500, an all time high. The report was made by 133 trust companies and state banks, 22 savings banks and 2 savings associations.

Agriculture.—Harvests in 1942 broke all previous records, when crop value reached $179,800,000, and the state department of agriculture estimated in November 1943 that the 1943 harvest and prices would surpass that total.

Leading Agricultural Products of New Jersey, 1943 and 1942

Crop	1943 (est.)	1942
Wheat, bu.	984,000	1,175,000
Corn, bu.	6,808,000	8,370,000
Oats, bu.	1,118,000	1,290,000
Barley, bu.	182,000	270,000
Rye, bu.	224,000	278,000
Potatoes, bu.	11,502,000	10,136,000
Apples, bu.	2,262,000	3,230,000
Tame hay, tons	399,000	379,000

Manufacturing.—Employment in New Jersey industries reached a record high in 1942. More than 800,000 were gainfully employed, according to preliminary reports to the state department of labour from 1,785 plants. The figures indicated an increase of 19% over 1941. Average weekly earnings ran to a record high of $43.79, and more than 5,000 plants were engaged in war production.

Mineral Production.—The total value of New Jersey's mineral production in 1939—the latest year for which federal figures were available in 1943—was $30,271,293. The leading products, in order of value, were zinc, clay, sand and gravel, stone and iron ore. (W. R. Ck.)

New Mexico. Fourth largest state in the southwestern United States, popularly known as the "Sunshine state"; admitted to the union in 1912. Total area, 121,666 sq.mi. (121,511 sq.mi. land, 155 sq.mi. water); pop. (1940) 531,818 (25.6% increase since 1930), divided among rural, 355,417; urban, 176,401 (33.2%); native white, 477,065; Negro, 4,672; foreign born, 15,247.

History.—The administration, legislature and congressional representation were Democratic in 1943. The chief officers of the state elected on Nov. 3, 1942, were: governor John J. Dempsey; lieutenant governor, James B. (Jawbone) Jones; secretary of state, Cecilia Tafoya Cleveland; auditor, J. D. Hannah; treasurer, Guy Shepard; attorney-general, Edward P. Chase; superintendent of public instruction, Georgia L. Lusk; commissioner of public lands, H. R. (Ray) Rodgers.

Legislation passed in 1943 to equalize state employees' salaries; to forbid legislators to hold additional state jobs; to provide child vaccination against diphtheria; to permit limited child labour under age 16 during the war; to create a state purchasing agent; and to levy a tobacco tax for needy aged people's support.

Education.—For the school year 1941–42, 710 rural schools, with 58,253 pupils and 1,754 teachers, cost $4,118,476.33; 247 municipal schools, with 73,089 pupils and 1,989 teachers, cost $5,737,214.28.

Public Welfare, Charities, Correction.—For the fiscal year ending June 30, 1943, the WPA spent $2,629,311 for labour and material. During the calendar year 1943, $29,102 was paid out for unemployment benefits. On June 30, 1943, $223,000 had been spent for old-age and survivors insurance, and $2,564,743 for public assistance.

The penitentiary appropriation was $130,480 for 519 inmates (Sept. 1, 1943); insane asylum, $325,000, 889 inmates; School for Mental Defectives, $47,480, 76 inmates; Industrial school, $49,000, 110 inmates; Girls' Welfare home, $60,000, 116 inmates (Dec. 1943).

Communication.—New Mexico had an estimated 62,896.3 mi. of roads in 1943; 9,351.5 constituted the state highway system. For the fiscal year ending June 30, 1943, the state highway department expended $3,004,386.76.

Steam railway companies operated 2,598 mi. of main track (1942).

There were 57 airports, and approximately 850 mi. of airways operated by two scheduled air carriers. There were about 50,550 telephones.

Banking and Finance.—On June 30, 1943, there were 22 national banks with deposits of $98,026,000; loans, $16,307,000; investments, $49,678,000; and 19 state banks with deposits of $32,775,000; loans, $5,550,000; investments, $14,560,000. Total resources of 12 building and loan associations in 1942 were $4,436,805.86 and of 7 federal savings and loan associations, $3,084,684.

The total of all state receipts for the fiscal year ending June 30, 1943, was $31,587,668.27; expenditures, $28,208,252.04. The gross and net debt were respectively $23,634,000 and $23,342,585.

Table I.—*Leading Agricultural Products of New Mexico, 1943 and 1942*

Crop	1943 (est.)	1942
Tame hay, ton	420,000	432,000
Grain sorghums, bu.	1,422,000	4,060,000
Wheat, bu.	2,405,000	4,813,000
Corn, bu.	2,930,000	3,792,000
Beans, bags	792,000	1,079,000
Cotton, bales	111,000	122,000

Table II.—*Principal Mineral Products of New Mexico, 1943 and 1942*
(Year ending Oct. 31)

Mineral	Value, 1943	Value, 1942
Copper	$18,504,489	$19,245,964
Potash	12,271,470	10,303,317
Zinc	10,055,836	6,767,425
Coal	6,130,364	4,929,458
Silver	230,625	408,903
Lead	733,956	535,052
Gold	75,603	338,924

Agriculture.—The total value of agricultural production in 1943 was estimated at $46,928,000; acreage harvested, 1,542,000. Livestock was valued at $116,873,000, Jan. 1, 1943.

Manufacturing.—Manufactured products were valued at $25,123,641 in 1939; an average of 3,250 employees received $2,912,993 in wages.

Mineral Production.—As in preceding years, copper was New Mexico's chief mineral in 1943. The total value of minerals produced was $50,057,314. (F. D. R.)

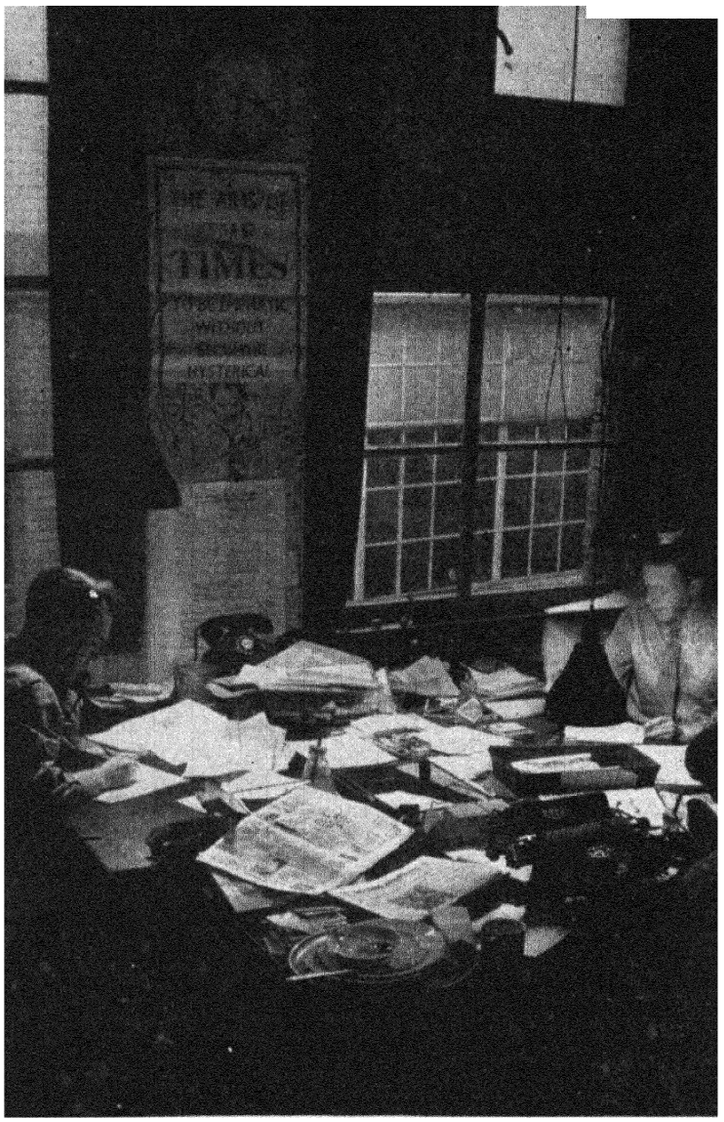
New South Wales.

A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. Dec. 31, 1941) 2,812,321. Chief cities (pop. est. Dec. 31, 1940): Sydney, capital (1,310,530); Newcastle (119,590). Governor (1943): Captain the Rt. Hon. Lord Wakehurst.

History.—The most contentious bill introduced by William J. McKell, the Labour premier, during 1943 embodied his proposals to reconstitute the legislative council (upper chamber). As then constituted, it was elected by members of both chambers, who voted as a single electoral body at simultaneous sittings of both chambers, members being elected for a period of 12 years, of whom one quarter retired each three years. Other measures of note included: alterations in the machinery for industrial arbitration; the grant of £A.100,000 for a cancer research institute in Sydney; a £A.100,000 grant for stepping-up milk production; a £A.100,000 grant for the provision of tractors and machinery to be hired out to small dairy farmers; and the reservation of an area 100 mi. long and 22 mi. wide in the southern Alps as a national park. Special committees on postwar public works were set up and plans submitted covering the expenditure of £A.50,000,000 over 20 years. Water conservation was to cost £A.1,000,000 a year over this period. There was a budget surplus for the fiscal year ended June 30 of £A.1,113,000, largely due to increased earnings by the government-owned railway system and the success of other government business undertakings.

Education.—In 1940: public schools 3,209; teachers, 12,877; scholars on roll, 359,777; average attendance, 296,924; expenditure by state, £A.4,882,000.

Finance.—In 1941–42: revenue, £A.65,865,000; expenditure £A.64,824,000; debt outstanding (June 30, 1942), £A.365,095,000.



Communication.—Roads (1940), 126,058 mi.; railways, government (Dec. 1942) 6,127 mi.; tramways (June 1941) 172 mi. Motor vehicles licensed (March 31, 1943): cars 174,154; commercial vehicles 72,334; cycles 14,395. Wireless receiving set licences (March 1943), 536,795.

Telephones (June 1941): exchanges, 2,018; instruments connected, 280,161.

Agriculture, Manufacturing, Mineral Production.—Production in 1942–43: wheat, 52,000,000 bu.; butter, 89,000,000 lb.; wool, greasy, 547,000,000 lb.; maize, 3,142,000 bu.; coal (1942) 12,223,000 tons; gold (1939), 87,189 fine oz. Industry and labour, 1941–42: factories, 10,166; employees (average) 298,245; gross value of output £A.339,488,312; unemployment (trade union returns) (March 1943) 1.4%. (W. D. MA.)

Newspapers and Magazines.

Paper shortage was the outstanding problem of American newspapers during 1943. Circulations increased at least 2.6%, attaining an all-time record of nearly 44,000,000 daily. National and classified advertising increased materially, offsetting a slight decline in local retail advertising. Manpower shortage was a serious problem which was somewhat eased by reduction in business, and by a great increase in the employment of women. Most newspaper meetings were concerned with government re-

NEWS DESK of the *Stars and Stripes*, the U.S. army's European daily, in the offices of the *Times* of London

strictions and threats to freedom of the press. In spite of these problems, the number of casualties among newspapers was smaller than normal and, because of adequate handling of war news, newspaper prestige with the public increased remarkably.

That war was the absorbing news topic of the year was shown by the selection of "Big Stories of 1943" announced on Dec. 31, 1943, by the news agencies. The Associated Press list was: (1) Overall blueprint for winning the war and keeping the peace; (2) Russia turns the tide; (3) Germany invaded through the roof; (4) Italy surrenders, wars on Germany; (5) America strikes back in Pacific; (6) Mussolini topples; (7) Pay-as-you-go taxes voted; (8) De Marigny murder case; (9) Coal strikes imperil war production; (10) U-boats lose battle of Atlantic. Other big stories included in the United Press and International News Service lists were: Four Allied conferences at Casablanca, Quebec, Cairo and Tehran; conquest of North Africa and Sicily; capture of Attu and Kiska; New Deal reverses and Republican gains; Jap execution of U.S. fliers; U.S. builds world's biggest air fleet and navy; preparation for opening of European second front; domestic manpower crisis including draft of fathers; anti-inflation battle and rise of black markets; Errol Flynn trial.

The year brought a succession of cuts in paper supply and rises in paper cost, made more difficult by rising circulations. The 25-man Newspaper Industry Advisory committee, and a similar magazine committee, conferred constantly with the War Production board on systems of rationing to reconcile the needs of the small newspapers and the huge demands of the metropolitan Sunday newspapers. During the first quarter of the year, the cut limited all newspapers except very small ones to the amount used during the same period in 1941. During the second quarter, all papers were cut 2½% below 1941. For the third quarter a sliding scale spread the saving from 2½ to 5% for various papers, and for the fourth quarter a new sliding scale brought the total reduction of 1943 to 10% below 1941. In November a new sliding scale for 1944 set up an annual reduction ranging from 4% for weeklies to 24% for metropolitan dailies. Meanwhile, on March 1, the Office of Price Administration authorized a price rise of $4 a ton; a similar rise in September brought the price to $58 a ton.

To meet the paper shortage, various expedients were announced: for instance, the tabloid New York *Daily News* raised its sales and advertising prices and urged readers to borrow copies; the Chicago *Tribune* eliminated classified advertising pages in editions going 50 mi. out of the city; many newspapers "froze" circulation and refused new subscribers; many newspapers rationed advertising; the Milwaukee *Journal* reduced its Saturday paper to an 8-page Victory edition; and finally the Chicago *Daily News* omitted all commercial advertising from Dec. 23 to Jan. 3. Scripps-Howard and other newspapers experimented with 30-lb. paper (instead of 32) with such success that the largest American paper-maker in December put the lighter paper on the market and congress was changing the tariff to admit lighter paper from Canada, which provides 75% of the American supply. Also, "ersatz," or de-inked, newsprint was tried by various newspapers.

Because of alarm among newspaper men concerning increasing wartime controls by government, almost every newspaper meeting of the year had the central theme of defense of freedom of the press; for example: the American Society of Newspaper Editors in Washington, Feb. 12–13; the Associated Press in New York, April 19, to which Kent Cooper, general manager, urged a world-wide crusade for freedom of news; the American Newspaper Publishers association in New York, in April, which appointed a 5-man Press Freedom committee; the 10th annual convention of the American Newspaper guild, in Boston, June 14–18, representing 20,000 members; the 58th annual convention of the National Editorial association, in Cincinnati, June 20, representing weekly newspapers in 42 states; 275 Associated Press editors meeting in Chicago, Sept. 9; the 4th annual Newspaper Week, Oct. 1–8, with the slogan, "Free Press—Free People—An Unbeatable Team"; the memorial to John Peter Zenger at St. Paul's Free Press shrine, East Chester, N.Y., during Bill of Rights week, Dec. 12–18. The American Society of Newspaper Editors, on Oct. 4, saluted the underground publishers of nazi-dominated Europe.

Voluntary censorship under Byron Price continued to work smoothly throughout the year, but there was increasing complaint against army and navy censorship and constant difficulty with Elmer Davis and the Office of War Information. In July, Mr. Price omitted his 6-month revision of the censorship code, because it was working so well, and in December he liberalized the code and warned against "unauthorized censorship." In October, the ban on radio and press weather forecasts was removed. In June, congress reduced the OWI domestic activities budget so sharply that Davis closed 62 regional offices and dismissed 794 of his writers, in July, Davis created an OWI advisory group of nine leading newspaper editors, urged President Roosevelt to release more war news, and in September startled the country with a series of "horror pictures" of army casualties. The press took great pride in "keeping the secret" of various important events which had been "released in advance": for example, the news of the Casablanca meeting of Roosevelt and Churchill in January was kept secret for 32 hours; in April, the press was silent about

the president's southern trip; the secret of the landing in Sicily in July was kept for more than a month; and in December, America "held the release" on the meetings of Allied leaders in Cairo and Tehran, although Reuters in Lisbon and Tass in Russia broke the release and German radio spread the "rumour" story. Mr. Roosevelt on his return forbade further "release in advance" on such events. The greatest flurry over censorship resulted from a White House order limiting press coverage of the United Nations Food conference in Hot Springs, Va., in March; considering this a precedent for future international conferences, the press fought so vigorously that the meeting was finally opened to them almost completely.

The anti-trust suit against the Associated Press, which was filed on Aug. 28, 1942, by the federal department of justice at the instance of Marshall Field of the Chicago *Sun*, continued through the year without conclusion. Three judges of the U.S. circuit court of appeals of New York—Judges Learned Hand, Augustus N. Hand and Thomas W. Swan—were on Jan. 7, 1943, named as an "expediting court" to handle the case. At a special meeting on Feb. 9, the A.P. further eased its by-law concerning election of members. Between January and June the government presented 545 questions of fact to A.P. for answer, and A.P. presented the government with 40 similar requests—piling up a record of over 2,000,000 words. Both sides agreed on May 29 to a "summary judgement" based on written evidence, filed their lengthy briefs, and on July 8 argued the case in court. The majority opinion in the court's 2-1 decision, handed down on Oct. 6, stipulated necessary revisions in A.P. admission rules to avoid the charge of "monopoly"—Judge Swan dissented. The department of justice filed its "proposed judgement for the court" on Nov. 12, and the A.P. was given 30 days—later extended to Jan. 3—to answer. Meanwhile, during December, various newspaper spokesmen urged A.P. to appeal the case, rather than file an answer, arguing that the decision tended to treat news-gathering as a "public utility" in violation of the constitutional free press guarantee, and of the sanctity of property right in "copy." On Dec. 15, the Chicago *Sun* again applied for membership.

Few other important legal battles affecting the press developed in 1943. One unprecedented case was the action on April 13 of a U.S. district court in fining 15 New York department stores $80,000 under the Sherman anti-trust act, because of their combined action in withholding advertising from the New York *Times* in protest against a raise in rates; the action was brought by the attorney general on the grounds that "readers feared the lack of advertising meant shortage of merchandise due to the war." Newspapers applauded as a victory for press freedom the 5-4 decision of the U.S. supreme court on May 4 annulling a city ordinance of Jeannette, Pa., which restrained Jehovah's Witnesses from distributing their pamphlets. The Federal Communications commission continued its investigation of newspaper ownership of radio stations, which it began in March, 1941, and in November the Newspaper-Radio committee protested to congress, arguing that newspapers controlled only 169 out of the 801 radio stations. In November, Press Wireless, a co-operative company formed by American newspapers in 1929, filed with FCC a protest against any proposed merger of international communications under government control, and charged government interference with transmission of war news. Much discussion centred about the Bankhead bill introduced in U.S. senate in May to authorize the U.S. treasury to spend annually $30,000,000 on newspaper advertisements of war bonds, allocating at least 50% to weekly newspapers. Some 93% of the weeklies supported the bill, but the daily newspapers opposed it as a "dangerous subsidy." After amending the bill on Nov. 16 to provide only $15,000,000 for non-dailies in small cities, the senate passed it by a small majority, but in December it was finally shelved.

Tabulations of newspaper achievements to aid the war effort ran into huge figures. The carrier boys of 900 newspapers, after selling 566,159,323 war stamps in 1942, sold 900,000,000 more by the end of Sept. 1943, and were credited with selling one-sixth of all Third Loan stamps. Tabulations announced by the U.S. treasury indicated that the daily and weekly newspapers printed 73,938 advertisements, totalling 114,682,123 lines and valued at $4,564,270 in the Second War Loan, in May, and almost double that amount in the Third Loan in September; newspapers donated over 40% of the space and merchants the rest. Some 1,600 newspapers in 27 states in August joined in a campaign to urge farmers to cut 2,500,000 cords of pulpwood to relieve the paper situation. Later, 1,100 dailies co-operated in November to collect 8,000,000 tons of waste paper. The annual threat of higher newspaper postal rates, appearing in March, again failed. Although the draft administration in January classified all newspaper employees as 3B "necessary men," by August only four newspaper jobs remained on the "essential list"; in April all newspaper workers were "frozen" to their jobs.

The casualty list of war correspondents was 15 dead and 69 wounded by December 1943 (28 held as prisoners up to April). This represented a casualty rate of 22% as against the army's 5%. Three correspondents had received military decorations, and by November 11 Liberty ships had been named after dead correspondents. As so many of the casualties were on bombing missions, newspapers in April ordered their men to avoid such risks. During the year, American newspapers had 370 reporters and 65 photographers with the armed forces overseas, and had 250 ready to cover the proposed second front. By April, correspondents had published more than 100 "I Seen It" books, and more appeared later. Most striking was the popularity of Ernie Pyle, of Scripps-Howard Newspaper alliance, whose war column in 162 newspapers (circulation, 9,000,000) and whose book made his name a household word. In the home offices, 822 daily newspapers in October reported an honour roll of 156 former employees killed in military service; 766 dailies reported 40,000 former employees in the army or navy and staff losses of as much as 30%.

Among other outstanding newspaper events of the year were: 25 American editors visited England during the summer as guests of the British ministry of information; the University of Missouri cancelled Journalism Week and instead published a book, "Journalism at War"; Linwood I. Noyes, of the Ironwood, Mich., *Globe* (circ. 7,500) was the first small daily publisher to be elected president of the American Newspaper Publishers association; the Milwaukee *Journal* in May increased its employee-ownership to 40% (600 employees own $3,000,000 of stock); a $20,000,000 Gannett foundation was set up in June to perpetuate the Gannett newspaper group; on Oct. 7 the 92-year-old Western Union Telegraph company absorbed the 62-year-old Postal Telegraph and became the largest wire and cable company in the world; at the request of the National Council on Education for Journalism, 12 schools of journalism set up emergency short courses for women and others adopted accelerated programs.

Magazines.—American magazines showed the effects of war more than newspapers, not only in the large weight of war in their content, but in shortages of paper and advertising. All except the smallest reduced their paper consumption at least 10% below 1942 and for 1944 faced a reduction of 25% below 1942; all popular magazines were much smaller in size or format and many adopted paper of lighter weight or inferior quality. Magazines were forced to refuse millions of dollars worth of advertising; *Life*, limited to 104 pages, rejected $4,500,000; *Fortune* reduced its page format. Circulations continued high; one over 4,000,000; four others over 3,000,000; six others over 2,000,000;

FIRST PRIZE WINNER: The most widely circulated and the most commented upon news photograph of the year, was that of Mrs. Roosevelt being given the traditional Maori "hongi" or nose kiss by her native guide, Rangi, when the first lady visited Whakarewarewa in New Zealand in September. Photograph by J. Thompson of Rotorua, N.Z., for *Look* magazine

SECOND PRIZE WINNER: "Slingin' Sammy" Baugh, great halfback of the Washington Redskins weeps after being removed in the first half of the annual professional football championship game at Chicago, Dec. 26. Baugh returned to the game in the second half and threw two passes for touchdowns, but the final score was: Bears 41, Redskins 21. Photograph by Mickey Rito of the *Chicago Times*

THIRD PRIZE WINNER: A year before Pearl Harbor, Bob Moore left his drugstore in Villisca, Iowa (pop. 2,011), and joined the army. Three years later he had become a captain. In Feb. 1943 he also became a hero. For bravery at Faid pass he was made a lieutenant colonel and in July was sent home on furlough to his wife and daughter. "Hero's Return" was chosen by *Britannica* as one of the most poignant 1943 news photographs. Photo by Earle L. Bunker of the *Omaha World-Herald*

and five others over 1,000,000. The pace set by 30 large magazines, in carrying free advertising of the 1st War Loan in 1942 was continued during the two loans of 1943. Co-operating, 100 national magazines appeared on the stands on Labor day with covers boosting women's civilian war work. In one July issue, *Life* devoted an entire section to printing the current war casualty list of 15,000 men, with home towns. *PM* of New York dropped colour from its format in November. The post office in September threatened to bar *Esquire* from the mails on charge of obscenity (the Varga nudes) but after hearings the postal board voted 2–1 to drop the charge; however, on Dec. 30, Postmaster General Frank C. Walker annulled *Esquire*'s second class postal privilege, effective Feb. 28, 1944, on the grounds that the magazine was "not devoted to useful information" worthy of mail subsidy. (G. M. Hy.)

Great Britain.—By the middle of 1943 more than 160 American journalists were operating in London in connection with the war.

J. H. Brebner, director, news division, ministry of information, went to Cairo early in the year to reorganize the ministry of information in the middle east, following upon many complaints of inefficiency and inadequacy.

In August, the country's stock of newsprint had reached its lowest level. Two new ships were built and launched by the Newsprint Supply company with special government permission. Two additional ships were under charter, making a fleet of five, including one original vessel. By October the stock of newsprint was increased to more than 20 weeks' supply. The government agreed that newspapers should slightly increase their permitted consumption of newsprint from October onwards for increasing circulation, and not for the printing of more pages. Including this increase, the weekly consumption of newsprint was still under 5,000 tons, as against 24,000 tons prewar. The controlled price of newsprint in October was £32 5*s.* per ton, and the equalized price obtained through the Newsprint Supply company £31 12*s.* per ton. This compares with the controlled price of £24 per ton on June 30, 1940.

Notwithstanding the newsprint difficulty, 181 foreign language newspapers were published in Britain. Of the grand total there were 41 Polish, 28 Czechoslovakian, 17 French, 14 Spanish, 13 German and 12 Dutch. There were also papers for the Chinese, Belgians, Austrians, Greeks, Hungarians, Italians, Norwegians, Rumanians, Swiss, Latvians and Danes in Britain.

A new monthly magazine, *Transatlantic*, was first published in October—"to assist the British and American peoples to 'walk side by side in majesty, in justice and in peace.'" Its editor, Geoffrey Crowther, was also the editor of the *Economist*. Arrangements were well in hand for the reappearance of the famous *Cornhill* in Jan. 1944 under the editorship of Peter Quennell.

It was announced that the *Manchester Guardian* had been vested in seven trustees to ensure that the general principles guiding the conduct of the paper would be maintained in the future. The *Economist* celebrated its centenary on Sept. 2 and the *News of the World* on Oct. 1.

Among important appointments during 1943 were that of J. W. Haley, joint managing director of the Manchester Guardian and Evening News, Ltd., as editor-in-chief of BBC and of Wilson Midgley, formerly New York correspondent of the London *Daily News* and *Star*, to the editorship of *John O'London's Weekly*.

Increasing use was made by the government of the advertising columns of the press to recruit for coal-mining and nursing, and for calling on the public to save still more for the war effort; for economy in the use of the railways, fuel, telephones and telegraphs; to guard against careless talk. A special campaign was undertaken to fight the venereal disease menace.

Newspaper profits were well maintained. The previous year's figures are in brackets: London Express Newspapers, Ltd., showed a trading profit of £247,956 (£247,789); Odhams Press, Ltd., £698,428 after the clearing of debenture and other interest; Benn Bros., net profit of £58,552; Manchester Guardian, £30,283 (£12,338); George Newnes, Ltd., £138,123 (£120,387); Associated Newspapers, Ltd., £567,124 (£535,124); Daily Mirror, £208,758 (final figure £202,804); and Sunday Pictorial, £222,573 (£192,497). (*See* also Advertising; Printing.) (S. R. C.)

Britannica Book of the Year selection of the best news photographs of 1943

New York. One of the original 13 states of the union, popularly known as the "Empire state," New York covers an area of 49,576 sq.mi., of which 1,647 sq.mi. are water. With a population of 13,479,142 (federal census, 1940) it retained its place as the most populous of the states. It had in that year a foreign-born population of 2,853,530, which included 584,075 born in Italy and 316,800 born in Germany. The capital is Albany, with a population of 130,577. Among the other cities are New York, with a population of 7,454,995, or about twice as many as any other city in the U.S.; Buffalo, 575,901; Rochester, 324,975; Syracuse, 205,967; Yonkers, 142,598; Utica, 100,518; Binghamton, 78,309; Troy, 70,304. Because of the influx of workers in war industries, the population of New York city increased greatly after 1940. The urban population of the state was 11,165,893 and the rural population, 2,313,249.

History.—The legislature, which continued in session until March 26, 1943, changed the date of the opening of the fiscal year from July 1 to April 1, raised the pay of state employees 7½% and 10%, appropriated $25,000 for child care centres under the state council for children whose mothers were engaged in war work, continued the Commission on Postwar Planning, put disabled veterans of World War II on the same basis as veterans of World War I, permitted the continuance of free lunches in the schools, removed the stigma of conviction of crime in the case of deserving youth between the ages of 16 and 19, created an Emergency Food commission and reapportioned the legislative districts.

Although the only state official to be elected was the lieutenant governor to fill the vacancy caused by the death of the incumbent in the summer, the election attracted national attention as it was believed that the result would foreshadow to a certain extent the outcome of the presidential election in 1944. The Republicans nominated State Senator Joseph R. Hanley and the Democratic candidate was Lt. Gen. William N. Haskell, who was also supported by the American Labor party. Hanley was elected by a majority of about 350,000 over Haskell. The principal officers in 1943 were Thomas E. Dewey, governor; Joseph R. Hanley, lieutenant governor; John J. Bennett, Jr., attorney general, and George D. Stoddard, commissioner of education.

Education.—During the fiscal year ending June 30, 1942, the last year for which complete figures had been assembled in 1943, there were 972 high schools with 741,596 pupils, and 8,537 elementary schools, with 1,427,151 pupils. The total cost of maintaining the schools, exclusive of money raised by the issue of bonds, was $357,923,285. In addition to the public schools there were 88 colleges and universities, including 11 teachers' colleges, with 151,000 students and a teaching staff of 16,197.

Public Welfare, Charities, Correction.—The number of persons receiving public assistance in August, 1943, was 202,117,

LITTERED STREETS OF HARLEM, New York city, after Negro looters had stripped stores during the riot of Aug. 1–2, 1943

for whose relief $7,484,225 was contributed as compared with $9,784,000 in Oct. 1942. The amount spent for home relief during the month was $2,585,574 or 51% less than in the same period of 1942. The amount spent for old age assistance was $3,610,557; $1,199,005 were spent to aid dependent children and $89,089 to assist the blind. There were eight state prisons, three reformatories, three institutions for defective delinquents and three hospitals for the criminal insane.

Communication.—There were in the state on Jan. 1, 1942, exclusive of streets in cities and incorporated villages, 84,591 mi. of highways, of which 71,836 were town and country roads. Of the total 58,620 were classified as improved. The state spent in 1942 $3,331,991 for construction and reconstruction, $9,303,779 for maintenance and repairs, $2,248,175 for engineering, administration and materials and $204,501 for engineering studies and planning, making a total of $15,088,446. Of this amount, $2,294,978 were contributed by the federal government. The state maintained a system of 525 mi. of canals including the Erie, 339 mi.; the Oswego, 24 mi.; the Cayuga-Seneca, 92 mi. and the Champlain, 60 mi. Although no tolls are charged, the canals yield a revenue of more than $500,000,000 a year for the use of terminals, the sale of water power and the operation of grain elevators.

Banking and Finance.—On Jan. 1, 1943, there were 132 savings banks with deposits of $5,574,423,000 and resources of $6,263,588,000; 126 state banks with resources of $245,970,000 and $220,896,000 in deposits; 155 trust companies with resources of $16,858,153,000 and deposits of $15,416,687,000; 5 private banks with resources of $174,239,000 and deposits of $149,103,000 and 14 industrial banks with resources of $73,310,000 and deposits of $66,233,000.

Agriculture.—According to the census of 1940 there were 153,238 farms in the state with a total acreage of 17,170,337. The value of the products sold was $274,175,053 of which $167,052,240 was received from the sale of livestock and livestock products.

Table I.—*Leading Agricultural Products of New York, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	23,177,000	27,600,000
Tobacco, lb.	660,000	1,450,000
Potatoes, bu.	29,127,000	27,405,000
Apples, bu.	12,250,000	18,997,000
Grapes, tons	44,000,000	69,600,000

Manufacturing.—In 1939, according to the biennial manufacturing census (none was taken during World War II) there were 34,506 manufacturing establishments employing 957,844 persons, paying $1,163,785,198 in wages and producing goods valued at $7,134,400,147.

Table II.—*Principal Industries of New York, 1939 and 1937*

Industry	Value of products	
	1939	1937
Boots and shoes	$104,144,500	$125,819,448
Bread and bakery products	204,500,887	243,386,287
Clothing	917,562,506	847,556,856
Steel products	197,884,816	157,809,733
Printing, including periodicals	416,760,806	576,731,299

Mineral Production.—The value of minerals produced in 1940 was $159,794,483 and in 1941 it was $190,319,185.

Table III.—*Principal Mineral Products of New York, 1941 and 1940*

	Value, 1941	Value, 1940
Cement	$16,673,726	$11,687,089
Coke	32,808,937	29,540,871
Pig iron	66,718,244	54,150,107
Petroleum	13,300,000	11,000,000
Salt	7,416,734	6,423,775
Stone	10,806,450	10,308,401
Zinc	5,706,900	4,496,436

(G. W. Do.)

New York City. The largest city in the U.S.A., New York had a population of 7,454,995, according to the census of 1940. Mayor: Fiorello H. LaGuardia. Results disconcerting to the politicians arose from the peculiarities of New York city's election laws in 1943. Both Republican and Democratic conventions nominated Thomas A. Aurelio to the supreme court. But after the conventions adjourned it was reported that Aurelio had thanked an alleged racketeer for his support. The conventions then met a second time and repudiated Aurelio; the Republicans nominated George Frankenthaler and the Democrats indorsed the American Labor party candidate, Matthew M. Levy.

The courts were asked to decide if a convention could repudiate a nomination made in accordance with law and they held that a nomination once made could not be withdrawn; therefore Aurelio was the regular Republican and Democratic candidate for the bench and his name had to appear as such on the party tickets. This decision forced Frankenthaler to run as an independent. Levy, as the Labor party candidate with indorsement of the Democrats, also ran as an independent. In view of the court decision that the name of Aurelio had to appear on the ballots of the two leading parties the result was foreseen, for the electors are in the habit of voting the straight party ticket. Aurelio won by a handsome majority over the combined opposition, and this, too, in spite of the unsuccessful attempt before the election to have him disbarred for alleged connection with racketeers.

The peculiarities of the law also resulted in the election of three Communist members of the city council. The voter is supposed to indicate on the ballot his first, second and third choices. The candidate who is first choice on 75,000 ballots wins. He wins also if he has a majority of the votes for first choice among the first three. The Communists confined their voting to first choice candidates with the result indicated. As there are only about 100,000 Communist voters in the city out of a total registration of about 2,200,000, they won a disproportionate share of seats in the council. It was planned during the year to ask the legislature to change the law so as to make a repetition of this thing impossible.

The prevalence of youthful crime in the Bedford-Stuyvesant section of the borough of Brooklyn led a meeting of representatives of 21 organizations of young people to adopt a resolution calling on the mayor to clean up the section and provide recreational facilities. It was charged that the arrest of girls under 21 for offenses against decency had increased 69.9% over 1942 and that the arrest of girls for crimes against property had increased 33.6%. It was also charged that more than half of the

burglaries were the result of the activities of youth under 21 and that 29% of the arson cases, 27% of the forgeries and 13% of the murders were due to the same youthful group. (*See* also MUNICIPAL GOVERNMENT.) (G. W. Do.)

New York University. A nontax-supported, privately governed institution of higher education occupying six principal centres of instruction in New York city. While student enrolment in 1943 had declined more than a third since 1940, the enrolment of women showed stability and some recovery was noted in the recession of enrolment in graduate divisions. There were more than 3,000 military students in training under government contract in various departments. Pearl Harbor day, Dec. 7, 1943, was observed with a student mass-meeting tribute to the more than 30,000 alumni and former students and 400 faculty members serving with the armed forces, and the estimated 200 who had lost their lives in such service. An Institute on Post War Reconstruction, embracing public forums, research and publication was established, and conferences supported by various exile governments were held on postwar educational problems of Europe. Special short-course conventions dealing with wartime problems of various related areas of government, law and business were held. The training of army post exchange personnel was launched under government auspices. The former Savage School of Physical Education of New York city was absorbed and consolidated with the university's teacher-training department of health and physical education. Gifts during the year exceeded $600,000, the principal item being $100,000 from the George F. Baker charity trust for the college of medicine. Degrees and certificates were conferred upon 3,615 candidates. Joseph H. Park succeeded John Musser as dean of the graduate school of arts and science, and with Frank H. Sommer's retirement Arthur T. Vanderbilt was appointed dean of the school of law. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (H. W. CH.)

New Zealand, Dominion of. A British dominion, consisting of a group of islands lying in the south Pacific between 34° 25′ and 47° 17′ S. and between 166° 26′ and 178° 36′ E. Area: Dominion proper 103,415 sq.mi.; other islands, 519 sq.mi.; pop.: Dominion proper (est. March 31, 1943), 1,640,191, including Maoris (93,116); Cook and other Pacific islands (census 1936), 16,350. Chief cities (pop. est. April 1, 1941): Auckland (223,700); Wellington (cap. 160,500); Christchurch (135,500); Dunedin (82,200). Language: English. Religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012). Governor general in 1943: Air Marshal Sir Cyril Newall; ruler: King George VI.

History.—The best indication of the progressive improvement in the war situation was provided by the fact that it was found possible to hold a general election in September. The Labour government headed by Peter Fraser was returned to power, though its majority was substantially reduced. A number of parties took the field but their candidates were roundly defeated, losing their deposits in practically every case. The "Democratic Labour" party of left wing dissidents from the Labour party was headed by J. A. Lee, who had the biggest majority in the 1938 elections when he stood as an orthodox Labour candidate. On this occasion he was heavily defeated. All his other followers forfeited their deposits, but their votes in five cases turned the scale against the government and let Nationalist candidates in. The National party went to the poll with a pledge, if elected, to form a non-party government and prosecute the war effort to the full. It promised to maintain the social security system introduced by the Labour government, removing "anomalies and injustices," but urged New Zealanders to entrust their economic destiny to the system of free private enterprise rather than government bureaucracy. The government took its stand on its war record and made a special appeal to soldiers serving overseas, whose votes were recorded, based on what had already been done to conserve their interests. This appeal apparently had considerable effect, for in several cases the servicemen's vote swayed contests in Labour's favour. Labour retained its hold on the cities, but lost ground in the semi-rural constituencies. The state of parties at the close of 1943 was: Labour 45, National 34, Independent 1.

Walter Nash, finance minister, returned from Washington to present the budget in June. War expenditure, it revealed, amounted to £144,000,000 for 1942–43, the main items being navy £8,500,000; army £88,000,000; air £24,000,000. Reverse lend-lease cost £7,000,000. Revenue receipts totalled £42,800,000. Net increase of debt in 1942–43 totalled £78,427,000, of which £73,908,000 was internal. The war overdraft from the United Kingdom government was £15,400,000, of which £8,000,000 was repaid during the year. Since March 1936, the ordinary debt domiciled in London had been reduced by more than £10,500,000. War expenditure for 1943–44 was estimated at £148,000,000 including reverse lend-lease £20,000,000. Estimated receipts were £46,000,000, payments by United Kingdom £12,000,000, local borrowings £50,000,000, and lend-lease £40,000,000. Provision was made for pensions increases. Disablement pensions were raised from £2 to £3 per week and other adjustments were made so that a totally disabled man with a wife and two children would receive £6 16*s*. a week. Pensions for widows of servicemen were also raised, so that a widow with two children would receive £4 16*s*. weekly free of tax. Mr. Nash, speaking of the economic position, said adequate measures had been taken to control manpower. Factory out-put for 1941–42 reached the record total value of £155,000,000—35% above prewar production. Primary production still exceeded prewar records.

To check the danger of inflation due to a rise of £50,000,000 in the national income while available goods had decreased by 40% an Economic Stabilization commission was appointed with A. T. Donnelly as chairman. It was given powers to control prices of 110 items from groceries to furniture and also wages and salaries.

Major C. F. Skinner returned from North Africa to become minister of rehabilitation. J. G. Coates, a former prime minister, and a member of the war cabinet, died suddenly in his office. He was succeeded by William Perry, president of the Returned Services association.

The New Zealand division took a prominent part in the expulsion of Axis forces from Africa, earning an eloquent tribute from Mr. Churchill when he addressed them at Tripoli. The Victoria cross was awarded to Second Lieut. Moana-Nui-a-Kiwa Ngarimu for great gallantry during the action at Tebaga gap, March 26, 1943. He was the first Maori to receive the award.

Education.—(Dec. 1941) state elementary schools, 2,230; scholars, 245,655; secondary, 197; scholars, 50,029. University of New Zealand has six constituent colleges, including two agricultural colleges at Lincoln and Palmerston North, grouped together as the New Zealand School of Agriculture; university students, 5,266. Total cost (year to March 31, 1942) £5,218,618.

Finance.—Revenue, consolidated fund, year to March 31, 1943, £42,361,009, expenditure, £38,206,431. Public debt (March 31, 1943) £463,825,371 (due in London £158,274,297, Australia £862,300, balance internal). Note circulation March 1943, £25,577,349; reserve (in Reserve bank) gold £2,801,878, exchange £25,002,266. Net overseas funds, May 31, 1943, £38,710,294.

Total expenditure on World War II to March 31, 1943, £239,000,000. Exchange rate: £N.Z. 125 equal £100 sterling. Deposits in post office and trustee savings banks (March 31, 1943) £102,790,182; depositors 1,383,136.

Trade and Communication.—Overseas trade: total merchandise exports, year ended March 1943, £75,702,878 (compared with £69,163,121 in 1942); total merchandise imports, year ended March, 1943, £60,781,375 (compared with £50,589,652 in 1942). Communication and transport: roads paved or surfaced (including main highways 12,381 mi.) 44,271 mi.; not paved or surfaced 9,108 mi.; railways 3,400 mi., passenger journeys, year to March 31, 1942, 28,610,945 (compared with 26,276,923); goods traffic 8,473,765 tons (compared with 8,426,182). Shipping (1941) entered 2,323,264 tons net, cleared 2,309,469 tons net. Motor vehicles licensed (March 1943) 298,635 (including 194,715 cars). Wireless licences, March 31, 1943, 368,942. Telephone subscribers 231,640.

Agriculture.—1941–42 acreages: wheat for threshing 258,002; oats for threshing 70,796; chaff and hay 143,218, not harvested, fed off, etc., 68,394; barley for threshing 36,026, total 41,088; maize for threshing 8,779, not harvested 5,229; linseed 859; peas for threshing 30,976; potatoes 15,201; onions 825; perennial rye grass 53,903; linen flax 20,200; western wolths and Italian rye-grass 11,789; cocksfoot 10,624; tobacco 2,435. Yields, total and per acre, wheat 8,671,244 bu. (33.61); oats 3,444,812 bu. (48.66); barley 1,296,630 bu. (35.99); maize 444,249 bu. (50.60); peas 852,077 bu. (27.51); potatoes 89,604 tons (5.89); onions 8,418 tons (10.20); perennial rye-grass 16,289,670 lb. (302). Dairy produce (1939–40): butter 3,103,797 cwt. (173,811 short tons); cheese 2,033,506 cwt. (113,876 short tons). Livestock in dominion, 1942: horses 261,611; cattle 4,641,714 (including 1,777,239 dairy cows in milk); pigs 688,677 (including 91,338 breeding-sows); sheep 31,751,660 (including 20,030,933 breeding-ewes).

Manufacturing.—Factory production, 1941–42: number of establishments, 6,367; employees 117,214; salaries and wages paid, £29,504,299; value of products, £155,566,193; value of land, buildings, machinery and plant, £87,127,932. (A. J. Hp.)

NHA: *see* National Housing Agency.

Nicaragua. A republic of Central America, bounded on the north by Honduras and on the south by Costa Rica. Area 57,143 sq.mi., including a water area of 3,475 sq.mi.; pop. (1940 census) 983,160. The capital is Managua (83,546); other leading cities (with pop.) are: León (30,573); Granada (24,843); Masaya (19,827); Chinandega (14,967); Matagalpa (8,506). Language: Spanish. President in 1943: General Anastasio Somoza.

History.—The political scene remained quiet in Nicaragua during 1943. War policies had been established early in the war and required no modification beyond a decision, announced on April 17, to inaugurate compulsory military service. In the summer legislation was introduced into congress which would amend the constitution to permit the re-election of President Somoza, strictly forbidden under existing provisions. In addition it was proposed that the provisions of the Atlantic charter be incorporated into the national constitution.

A planned health project was started in 1943, with the United States to spend $500,000 in aiding in malaria control, establishment of a nursing school in Managua and health centres in other cities, and for other assistance in improvement of health conditions. There was again talk of construction of a Nicaragua canal to relieve pressure on the Panama canal.

Economically, the year proved to be a boom period for Nicaragua, in spite of priorities and scarcities of goods. Government income was such that it was possible to retire in June bond issues not due for redemption until several years later. In spite of cessation in October of work on the Inter-American highway, employment circumstances remained satisfactory. Inflation was a threat, and living costs steadily mounted in spite of price controls.

NICARAGUAN CADETS of the republic's military academy b[illegible]wed by President Anastasio Somoza in 1943

Education.—In 1941 Nicaragua had approximately 650 elementary schools (about 550 state and 100 private) with a total enrolment of 61,000 (average attendance was much lower, however). Secondary schools numbered 12 (3 national, 9 private); enrolment, 1,250.

Finance.—The monetary unit is the córdoba, fixed in value at 20 cents U.S. A surplus of 300,000 córdobas was announced for the fiscal year ending June 30, 1943. In 1941 the total public debt was 8,672,419 córdobas.

Trade and Resources.—The year was an exceptionally good export year; the increase in trade compared with 1942 was estimated at as much as 226%. Exports in 1942 were valued at 71,632,985 córdobas; imports at 33,861,365 córdobas. The favourable trade balance with the United States for nine months ending Sept. 30, 1943, amounted to $4,801,000.

The latest crop estimates for the 1942–43 year showed: coffee 189,393 bags (a bit low because of early heavy rains); rice 6,000,000 lb.; sesame 8,000,000 lb.; corn 33,000,000 lb.; beans 10,000,000 lb.; cotton 19,000,000 lb.; cacao 700,000 lb.

Gold is normally the most important item of export (61% in 1941); production was beginning to suffer in 1943 from worn-out equipment. For the first 10 months of 1943 gold exports were $6,646,923 (4% under the same period of 1942). From May 2, 1942, to May 31, 1943, it was estimated that nearly $1,000,000 worth of crude rubber had been exported.

Communication.—In 1942, Nicaragua had 270 mi. of railway, and some 2,000 mi. of highway (most of it unimproved). Inter-American road-building projects improved highways, but to an

extent as yet unspecified. Construction on the Inter-American highway ceased in October. Air service is supplied by Pan American Airways and T.A.C.A. Steamer service improved during the year.

BIBLIOGRAPHY.—Dana G. Munro, *The Five Republics of Central America* (1918); Chester Lloyd Jones, *The Caribbean since 1900* (1936); Isaac Joslin Cox, *Nicaragua and the United States* (1927). (D. RD.)

Nickel. Production figures on nickel were lacking from 1938 on, but rough estimates placed the world total at 149,913 short tons in 1941, 136,685 tons in 1940, and 130,071 tons in 1939, as compared with 121,804 tons in 1938. Production in Canada was officially announced as increasing to a new record high in each of the war years, but there was no basis for an estimate of the amount of the increase in 1942 over 1941. The Canadian production capacity was increased by 25,000 short tons, but because of labour shortage the full capacity was not utilized. In spite of this, war demands of the United Nations were met, though during the latter part of 1943 output dropped 10% below the peak. Various exploration projects discovered considerable tonnages of low grade nickel ore at several localities in the United States, but the nickel content was so low in all instances that there was small chance for commercial exploitation, even under war conditions.

The new development at Levisa bay on the north coast of Cuba was scheduled to start operations before the end of 1943, using a new process for the treatment of silicate ores, producing nickel oxide which would be shipped to the United States for further treatment. (G. A. RO.)

Nielsen, Alice (1876–1943), U.S. singer, was born June 7 in Nashville, Tenn. "Discovered" in a church choir where her bell-like soprano stood out clear and strong, Miss Nielsen decided on a singing career and went to study voice in San Francisco. In 1893, she sang with a Gilbert and Sullivan troupe, later joining an opera company in San Francisco. She then went east, had indifferent success in Boston and New York until she was discovered by Victor Herbert, who engaged her as the leading lady for his operetta, *The Serenaders.* Miss Nielsen was an instantaneous success. Mr. Herbert then composed two light operas, *The Fortune Teller* and *The Singing Girl,* especially for his new star. But her ambitions to become a prima donna in grand opera led her to forsake operettas and she studied in Italy making her operatic debut in Naples, 1903, as Marguerite. Returning to the United States, she made her debut in 1905 at the Casino theatre, New York city, as Norina in *Don Pasquale.* She was soon accepted as one of the elite among the operatic giants of that "golden age"—Caruso, Tetrazzini, Melba, et al. From 1910 to 1915, she played with the Boston Opera company and also appeared with the Metropolitan and Civic opera in Chicago. She made her last public appearances in light opera in 1917. Miss Nielsen died in New York city, March 8.

Nimitz, Chester William (1885–), U.S. naval officer, was born Feb. 24 in Fredericksburg, Tex., and was graduated from Annapolis in 1905. An experienced submarine officer, during World War I he was chief of staff to the commander of the Atlantic fleet's submarine force. He was promoted to rear admiral, June 23, 1938. On Dec. 17, 1941, the navy high command was overhauled after the surprise attack on Hawaii, and Admiral Nimitz was made commander-in-chief of the Pacific fleet, with the rank of admiral. He assumed his post at Pearl Harbor on Dec. 31, 1941.

On Dec. 7, 1942—the first anniversary of Pearl Harbor—he predicted that the Pacific fleet would soon carry the war to Japan's home waters.

On Oct. 5 it was announced that Adms. King, Nimitz and Halsey had completed a series of conferences at Pearl Harbor. At a press conference in November, Adm. Nimitz told newspapermen that Japan's final defeat would probably be launched from China.

Nitrogen, Chemical. Although nitrate deposits were known to exist in at least 23 states of the United States, all of them were too small and too low in grade for any commercial recovery. Chile still remained the sole source of natural nitrates, but the bulk of the consumption of chemical nitrogen was from coal via by-product coke ovens, and from plants for the fixation of atmospheric nitrogen. Normal prewar consumption of chemical nitrogen in the United States was about 500,000 short tons, 80% in agriculture and the remainder in industrial uses; how much this amount was increased by war demands it was impossible to say, but the available supply was reported to be inadequate, and all commercial nitrogen compounds were under allocation by the War Production board. Synthetic plant capacity was heavily increased and among others the plant at Muscle Shoals, Ala., built during World War I, but not completed in time for use, was modernized in 1942 and was making ammonium nitrate for explosives and fertilizers. Other new plants produced ammonia, ammonium nitrate and sodium nitrate. (G. A. RO.)

Noguès, Auguste (1876–), French army officer, was born in the Haute-Pyrenees department, France. He entered the École Polytechnique at the age of 21 and was commissioned as a lieutenant. He was stationed in Africa, 1908–14, saw field service in World War I and participated in the Rif campaign, 1924–26. He was named resident general of Morocco in 1936 by Léon Blum, popular front chieftain. At the outbreak of World War II, Noguès was made commander in chief of all French forces in North Africa. After the establishment of the Vichy regime, he pledged fealty to Marshal Pétain, but in Oct. 1940, he warned both Spain and the axis countries that he would not surrender North Africa to any invading force, even if Pétain ordered him to do so. At the time of the U.S. landings in North Africa in Nov. 1942, Noguès ordered French troops to fire on U.S. soldiers debarking at Casablanca. However, after Allied occupation of North Africa became a fait accompli, he returned to Algiers and assertedly persuaded other recalcitrant French colonial officers to effect a compromise with De Gaulle's Fighting French armies. After the assassination of Darlan, Noguès was appointed to Gen. Henri Giraud's imperial war council, Dec. 27, 1942, and was retained as governor general of Morocco. In Feb. 1943, Noguès expressed amazement that he was "unpopular" with the Americans and insisted that he did the "honourable" thing in opposing the Allied landings. On June 4, Noguès, who was on Gen. De Gaulle's blacklist as a pro-fascist and pro-Vichyite, submitted his resignation as governor general.

North Borneo: *see* BRITISH EMPIRE.

North Carolina. A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union; area 52,712 sq.mi. (49,142 sq.mi. land, 3,570 sq.mi. water); pop. (1940), 3,571,623, of which 974,175 (27.3%) were

urban, 2,597,448 (72.7%) rural and 1,005,501 (28.2%) nonwhite. Capital, Raleigh (46,897); other cities: Charlotte (100,899); Winston-Salem (79,815); Durham (60,195); Greensboro (59,319); Asheville (51,310).

History.—The first wartime legislature of North Carolina since 1865 adjourned on March 10, 1943 after 55 days of labour. Notable legislative actions were the nine months' public school law, the granting of emergency war powers to the governor and council of state, the creation of a state school for delinquent Negro girls, the first authorization of state financial support for art and music, the establishment of unified administrative control of public schools, of state correctional institutions and of state institutions for mental defectives, the creation of a state postwar reserve fund of $20,000,000, and the enactment of record maintenance appropriations with no increase in taxes.

During 1943, an average of more than 300,000 young men were constantly in training in nearly fifty military and naval installations in the state.

At Kitty Hawk on Dec. 17, 1943, was celebrated the 40th anniversary of the first successful flight by the Wright brothers.

State officers in 1943 were: J. Melville Broughton, governor; R. L. Harris, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney general; W. P. Stacy, chief justice.

Education.—In 1941–42 there were 3,602 public elementary schools with 18,448 teachers and principals and 671,614 enrolled pupils and 1,004 public high schools with 7,854 teachers and principals and 206,299 enrolled pupils, operated at a cost of $36,684,670, more than three-fourths of which was contributed by the state government. The state provided bus transportation for 341,135 school children at an average cost of $7.71 per pupil.

Public Welfare, Charities, Correction.—In Oct. 1943, public grants amounting to $382,207 were made to 35,672 persons for old-age assistance; $132,487 to 7,104 families for aid to dependent children; $34,914 to 2,219 blind persons; and $23,164 to 2,693 cases for general relief (by the county governments). During the year ending June 30, 1943, the total amount of public relief funds distributed was $7,785,725; and in 1942 unemployment benefits amounted to $2,984,220. In 1943 the state maintained nine charitable institutions with 9,575 inmates on Nov. 1; five correctional institutions with 831 inmates; and state highway prison camps with 6,467 prisoners.

Communication.—In 1943 the state highway and public works commission maintained 11,385 mi. of state highways, of which 9,905 mi. were hard-surfaced, and 49,046 mi. of county roads, of which 2,446 mi. were hard-surfaced. There were 4,581 mi. of railroads, 324 mi. of city bus routes, 10,277 mi. of passenger bus routes and 11,525 mi. of freight vehicle routes in 1943.

Banking and Finance.—On Oct. 18, 1943, there were 44 national banks with deposits of $278,636,000 and resources of $295,788,000, and 182 state banks with deposits of $873,002,522 and resources of $932,002,903. In 1942 there were 152 building and loan associations operating under state charters with total assets of $90,952,087. In 1941–42 state receipts were $210,081,593; disbursements, $154,388,246. On June 30, 1942, the state gross bonded and net debts were $133,736,500 and $113,942,103, respectively. The assessed value of property was $2,496,247,967 in 1941. In the state general fund there was a cash surplus of $39,370,000 on June 30, 1943.

Agriculture.—Stationary acreage, reduced production, and increased value due to higher prices characterized 1943 wartime agriculture in North Carolina. The total value of production harvested from 6,534,000 ac. was approximately $500,000,000, of which tobacco alone accounted for $222,300,000. The cash income of North Carolina farmers in 1942 was $373,848,000 from crops, $67,346,000 from livestock and livestock products, and $22,443,000 from government payments. The value of the lands and buildings on the 278,276 farms in 1940, 44% of which were operated by tenants, was $736,708,125.

Table I.—Leading Agricultural Products of North Carolina, 1943 and 1942

Crop	1943 (est.)	1942
Tobacco, lb.	553,680,000	574,400,000
Cotton, bales	505,000	727,000
Corn, bu.	51,018,000	47,068,000
Tame hay, tons	1,263,000	1,163,000
Peanuts, lb.	317,100,000	332,100,000
Wheat, bu.	5,812,000	8,014,000
Sweet potatoes, bu.	7,760,000	8,855,000
Irish potatoes, bu.	12,000,000	9,434,000
Oats, bu.	5,977,000	6,625,000
Soybeans, bu.	2,313,000	3,484,000
Lespedeza seed, lb.	31,000,000	34,500,000
Peaches, bu.	252,000	2,463,000
Apples, bu.	490,000	1,086,000
Pecans, lb.	2,700,000	2,500,000

Manufacturing.—In 1939 manufacturing establishments numbering 3,225 employed 270,210 wage earners at wages of $199,289,501 and made products valued at $1,421,329,578. War needs and higher prices boomed North Carolina industrial production to about $2,000,000,000 in 1943.

Mineral Production.—The mineral production for North Carolina in 1941 was valued at approximately $19,000,000. In quantity production of mica, feldspar and bromine, North Carolina ranked first among the states; but in value of all minerals produced, it ranked thirty-fifth. The war brought increased mining activity in 1943, especially in mica and manganese.

Table II.—Principal Mineral Products of North Carolina, 1941, 1940 and 1939

Mineral	Value, 1941	Value, 1940	Value, 1939
Stone	$4,806,623	$4,850,277	$6,979,426
Clay products	5,356,000	4,620,000	4,761,867
Sand and gravel	2,345,165	1,430,457	1,101,369
Feldspar	552,386	426,784	397,631
Mica	...	391,481	253,721
Talc and pyrophyllite	567,921	298,382	283,789

BIBLIOGRAPHY.—U.S. Census; reports of state agencies; 1943 Session Laws.

(A. R. N.)

North Dakota. A west north central state of the United States, popularly known as the "Flickertail state." Land area, 70,054 sq.mi.; water area, 611 sq.mi.; pop. (1940) 641,935. The rural population was 510,012; urban, 131,923. Capital, Bismarck (15,496). The chief cities are Fargo (32,580); Grand Forks (20,228); and Minot (16,577).

History.—The chief officers of the state in 1943 were as follows: governor, John Moses; lieutenant governor, Henry Holt; secretary of state, Thomas Hall; state auditor, Berta E. Baker; state treasurer, Carl Anderson; attorney general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl.

Education.—Elementary schools in 1943 had an enrolment of 95,226; secondary schools, 30,128. The total number of schools was 3,928. The institutions of higher learning were the state university and school of mines, the agricultural college, three state teachers' colleges, two normal schools, a school of forestry and a school of science. The total enrolment in these institutions in 1943 was 5,589 and their teaching staffs numbered 365.

Public Welfare, Correction.—The WPA during the fiscal year ending June 30, 1942, expended $4,171,742 of federal funds and employed an average of 6,382 per month. The number of correctional institutions in 1942 was seven and the average number of inmates was 565. The cost of maintenance was $1,500,000.

Communication.—Mileage on state highways on Jan. 1, 1943 was 7,073.1; of rural highways on Jan. 1, 1942, 98,509.6. State expenditures of the highway department for the year ending June 30, 1943 were $3,932,210.93. The total railway mileage in the state in 1942 was 6,211.92.

Banking and Finance.—On Dec. 31, 1942, there were 115 state banks and one trust company, with resources of $90,392,564.72 and deposits of $84,702,824.44. Twelve savings and loan associations had resources of $10,564,042.18 for 1942. For the year ending June 30, 1943 state receipts were $37,419,319.66, and expenditures were $29,164,181.99. The bonded indebtedness of the state on Dec. 31, 1943 was $20,397,350.62.

Agriculture.—The total farm acreage harvested in 1943 was 17,534,000 (excluding wild hay). The cash income from crops and livestock was (1942) $306,654,000, including benefit payments of $23,010,000. Cash income from livestock (1942) was $121,219,000.

Table I.—*Leading Agricultural Products of North Dakota, 1943 and 1942*

Crop	1943	1942
Spring wheat (other than durum), bu.	121,486,000	112,180,000
Durum, bu.	32,670,000	37,664,000
Corn, bu.	25,335,000	29,000,000
Oats, bu.	70,924,000	74,925,000
Barley, bu.	63,648,000	67,454,000
Rye, bu.	4,014,000	16,082,000
Flax, bu.	15,052,000	9,181,000
Potatoes, bu.	22,100,000	17,955,000

Manufacturing.—The total value of manufactures in 1939 was $43,767,082, and the total employment was 3,435. The estimated value of creamery butter for 1942 was $24,921,000. The value of flour and grain mill products in 1939 was $5,303,788; of publishing and printing, $2,255,874.

Table II.—*Principal Mineral Products of North Dakota, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Coal	$2,425,000	$2,380,000
Sand and gravel	128,279	151,824
Natural gas	29,000	27,000

Mineral Production.—For the year ending July 1, 1942, the production of lignite coal was 2,469,364 tons, valued at $3,099,633.68. The total value of mineral production in 1939 was $2,689,627; in 1938 it was $2,653,473. (O. G. L.)

Northern Ireland: *see* IRELAND, NORTHERN.

Northern Rhodesia: *see* RHODESIA.

Northern Territory OF AUSTRALIA. Area 523,620 sq.mi.; pop. (June 30, 1940): aboriginals, full-blooded, 13,901; half-caste, 902; white (est. Dec. 31, 1941), 9,615. Capital, Darwin (pop. Dec. 31, 1940, 3,900).

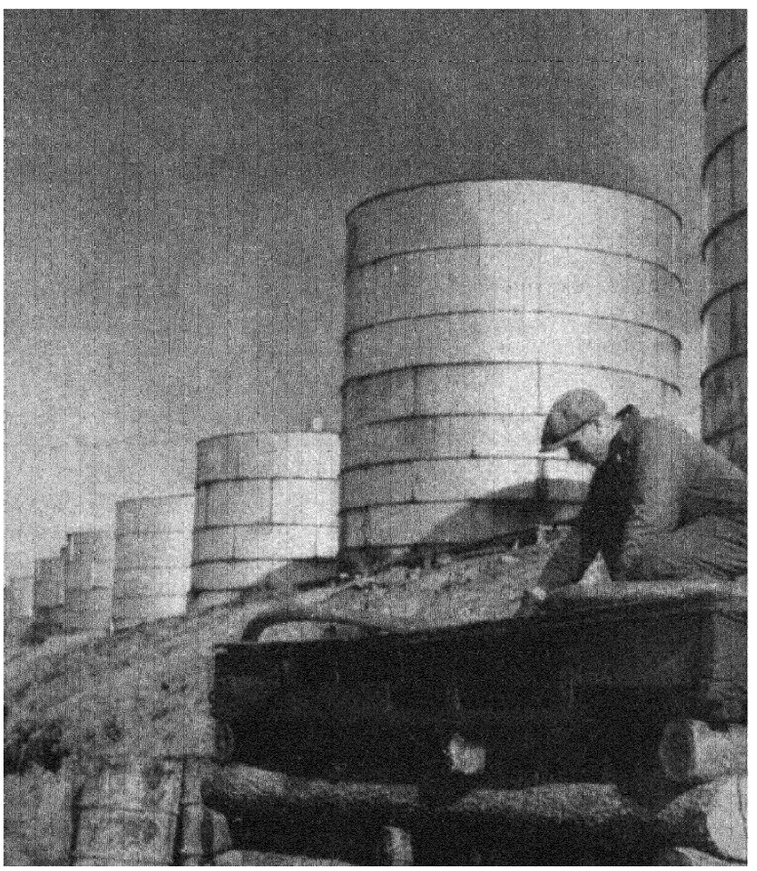
History.—The Northern Territory remained a "proclaimed defense area" throughout 1943. Troops stationed there proved that areas which were formerly regarded as useless country could be made highly productive.

Finance.—Revenue (1942–43), estimated, £A.47,000; from Central Australia railway (1942–43) £A.1,900,000; from North Australia railway (1942–43) £A.495,000. Expenditure, ordinary appropriation (1942–43) £A.329,650; new works, etc. £A.174,000.

Production and Communication.—Production, 1939–40: pastoral industry, £A.587,821; gold, £A.233,789; wolfram, £A.47,336; pearl shell, £A.15,998. Railways, government (Dec. 31, 1941), 508 mi. (W. D. MA.)

Northwestern University. An institution of higher learning at Evanston and Chicago, Ill. The university comprises the following divisions: the college of liberal arts, the graduate school, the technological institute and the schools of music, education, speech, commerce and journalism, all located in Evanston (suburb of Chicago) on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district. A total of 1,829 degrees were awarded during 1943.

For the fiscal year ending Aug. 31, 1943, gifts to the university totalled $876,858, exclusive of the $20,000,000 bequest of Walter P. Murphy for the development of the new technological institute.



During the year the university strengthened its programs in medicine and home economics by taking over the Illinois Social Hygiene League and the School of Domestic Arts and Science in Chicago.

With approximately 80% of their students in uniform, the medical and dental schools concentrated most of their efforts in training men for the armed forces. An increasing amount of confidential research was carried on for the government in the technological institute and other divisions of the university. Training for war industries was given to hundreds of men and women. Two naval schools were maintained: the naval reserve midshipmen's school on the Chicago campus, and the radio operators' school on the Evanston campus. The navy V-12 college training program was established on July 1, 1943.

A total of 266 members of the faculty were in military or governmental service. Over 8,000 alumni of the university were in the armed forces, and 68 of them had died in service. The university made plans for the erection after the war of a memorial chapel in honour of its war dead. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Northwest Territories. The Northwest Territories comprise the territories formerly known as Rupert's land and the Northwestern territory, except such portions thereof as form the provinces of Manitoba, Saskatchewan and Alberta and the Yukon territory, together with all British territories and possessions in North America and all islands adjacent thereto, not included within any province, except

FORT NORMAN REFINERY on the Mackenzie river, Northwest Territories, Canada. A 550-mi. pipe line—the Canol project—was under construction in 1943 by the U.S. army to carry the huge petroleum reserves of the Mackenzie basin to the Alaska highway and beyond. The cost of the project was under investigation by a U.S. senate committee at the end of the year

the colony of Newfoundland and its dependencies. Area, 1,309,682 sq.mi.; pop. (1941 census) 12,028; seat of government, Ottawa. For administrative purposes, the Territories in 1918 were subdivided into the provisional districts of Mackenzie, Keewatin and Franklin. The Northwest Territories act (1927) provides for a territorial government composed of the commissioner of the Northwest Territories, the deputy commissioner and five councillors appointed by the governor general in council. The Northwest Territories council in 1943 was composed as follows: commissioner, Charles Camsell; deputy commissioner, R. A. Gibson; members of council, A. L. Cumming, K. R. Daly, H. L. Keenleyside, H. W. McGill, S. T. Wood; secretary, D. L. McKeand.

Transportation and Communication.—Inland water transportation on the Mackenzie river system from railhead at Waterways, Alberta, to points in the Mackenzie district was provided by three companies, two of which maintained passenger services. These companies carried a large volume of freight on boats and barges, in addition to that handled by Marine Operators, Ltd., for the Canol project. Regular commercial air services, which also carry mail, were maintained from Edmonton, Alberta, to numerous settlements. Construction of new landing fields at key points permitted operation of wheel-equipped aircraft the year round. Medical centres, trading posts and other places in the eastern Arctic were served by the annual supply ship from Montreal, Quebec, which also carried mail. Auxiliary boat services from Churchill, Manitoba, were also provided. Radio communication was maintained between important settlements and trading posts in the Territories and outside points through government and private commercial radio stations.

Fur Trade.—The fur trade and mining are the principal industries of the Territories. The value of pelts harvested for the year ended June 30, 1942, was $2,840,701. Fur trading is controlled by regulation and is open only to those who have been issued permits and who have established permanent posts. Natives and half-breeds living the life of natives enjoy free hunting and trapping privileges. Of the white residents, only those who, under the regulations, are included in an established eligible list are permitted to hunt and trap and such individuals require an annual license. Reindeer herding in the northern Mackenzie district was continued in the interests of the native population.

Mineral Production.—The search for strategic minerals to meet wartime demands was a feature of mining activity in the Northwest Territories in 1943. Geological parties of the department of mines and resources successfully carried on exploratory and detailed field work in the Yellowknife district, and a number of mining companies also engaged in exploration and prospecting. As a result, a large number of claims were staked. The mill at the pitchblende-silver property of Eldorado Mining and Refining Company, Ltd., at Great Bear lake was operated at full capacity to meet the demand for concentrates from which radium and uranium salts are produced. Labour shortages brought about by war conditions and the transfer of men to base metal workings in other parts of Canada resulted in a curtailment of gold production in the Yellowknife area. Milling operations at the Con and Rycon mines of Consolidated Mining and Smelting Company of Canada, Ltd., were discontinued in August, and Thompson-Lundmark Gold Mines, Ltd., property was closed down temporarily in Sept. 1943. Production, however, was maintained at Negus Mines, Ltd. The approximate average monthly value of gold production from these mines for the first eight months in 1943 was: Con, $107,610; Rycon, $12,610; Negus, $67,000; Thompson-Lundmark, $68,000. The total value of gold production in the Northwest Territories for the five-year period ended August 31, 1943, was approximately $13,685,000.

Canol Project.—A development in 1943 was the extensive drilling program carried out at Norman Wells in the lower Mackenzie region as part of the Canol project. This project, authorized by an exchange of notes between the governments of Canada and the United States, was a joint defense undertaking involving (1) a program of development to increase the production of oil in the Northwest Territories to supply the requirements of the armed forces in Canada and Alaska and for use along the Alaska highway; (2) the construction of a pipeline to convey crude oil from Norman Wells to Whitehorse, Y.T., and (3) erection of an oil refinery at Whitehorse. Drilling was being carried out to determine the extent of the oil field. Until completion of the pipeline, production was restricted to meet local needs, and as a result no sustained test of the capacities of the wells brought in was, up to the close of 1943, possible.

(R. A. G.)

Norway. A country of northern Europe, bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. by the North sea. Area 124,556 sq.mi.; pop. (est. 1939) 2,921,000. Capital, Oslo (253,124). Other principal cities, with 1930 populations, are Bergen (98,303); Trondhjem (54,458); and Stavanger (46,780). Religion, Lutheran Christian. Ruler in 1943: King Haakon VII (*q.v.*). Prime Minister: Johan Nygaardsvold (in exile in London). Norway was occupied by Germany in 1940, and was administered in 1943 through Reichscommissar Josef Terboven and Premier Vidkun Quisling, with General Nikolaus von Falkenhorst of the army and William Rediess of the gestapo.

History.—During 1943 Norway was the scene of varied military activity. Raids such as the ones at Larvik and Florö sank nazi ships and destroyed factories. At Rjukan the nitrate works was blown up, reportedly by paratroopers. Later the area was bombed and the great electrolysis plant demolished. The large aluminum plant at Heröya was likewise bombed as was the molybdenum mine at Knaben near Stavanger, and the U-boat base at Trondhjem. A combined British and United States naval force struck Bodö in the far north on Oct. 4, 1943 and in surrounding waters sank nine nazi merchant vessels. One of the most daring feats of the war was the attack by British midget submarines on the "von Tirpitz" in Alten fjord (Sept. 22); it left the German battleship incapacitated for at least several months. Later, off North cape (Nordkapp), a British convoy escort sank the "Scharnhorst." Fighting also took place at Spitsbergen, where a German force raided the Norwegian garrison on Sept. 8, evidently attempting unsuccessfully to put the meteorological station out of commission.

The peoples' war within Norway gathered strength during the year despite repression and a steady stream of executions (189 acknowledged). Hostages were taken, but this seemed not to deter sabotage. Concentration camps in Norway were crowded with about 12,000 inmates, and about 1,500 had been taken to Germany by November, prior to the arrest of the Oslo students. Some 2,300 Jews arrested late in 1942 had their property confiscated and about 1,500 of them were sent to Poland. Many young men continued to escape to England or to Sweden. Some 17,000 Norwegians were in Sweden by the summer of 1943, but the border was becoming increasingly difficult to cross. The teachers arrested in 1942 were released except for about 40.

The Germans had great difficulty with the students and faculty at the University of Oslo. In March 1943, when the students refused to recognize the nazi student organization, the university was closed and the students sent to do forest work. In the fall the government attempted to enforce new politically determined admission requirements. When a number of the faculty protested they were sent to a concentration camp. But the students also

HAAKON VII, Norway's exiled king (centre), laughing at a remark by the lord mayor of Cardiff, Wales, at a luncheon for Norwegian merchant sailors in July 1943

objected, and too clearly showed their lack of appreciation of the "new order"; hence the mass arrest of 1,200 students on Nov. 30. This act aroused resentment and vigorous protests from Sweden and Switzerland (among the few free peoples who were still on any kind of speaking terms with the nazis), but a large number (at least 300) were nevertheless transported to Germany, where they were promised a special camp.

On Aug. 16, 1943 Quisling issued a decree recognizing a *de facto* state of war in Norway; under it an Oslo police official, Gunnar Eilifsen, was immediately executed, and the entire force of 500–550 men was required to swear loyalty to the regime on pain of death for refusal. The cause of the difficulty was supposedly the refusal of the police to arrest girls to be taken to Germany for labour service. On Oct. 1 a new decree stipulated the death sentence for any disobedience of orders. Still there could be, and was, effective opposition; when an additional 35,000 labourers were demanded, people gave false names and addresses and by various means cut the available number to 3,500; then they fired with gasoline the building containing 90,000 of the record cards.

However, fortification and road building were pushed forward. 100,000 Norwegians were doing forced labour, and probably an additional 100,000 foreigners. In addition Norway had to support an occupying army of about 200,000 men. Total costs for three years of "protection" ran to 9,000,000,000 kroner, and the national debt rose from 1,500,000,000 kr. to 4,000,000,000 kr. Funds taken from the Bank of Norway amounted to 6,600,000,000 kr.

One of the encouraging events of 1943 to Norwegians was the Swedish order of August forbidding the transit and leave traffic for German materials and soldiers on Swedish railroads. This meant inconvenience for the Germans, and it meant above all the removal of the chief sore point in the relations between Norway and Sweden.

The food situation in the country was bad. The farmer's capital was exhausted, his help was gone, horses were scarce, there was little machinery and no fuel, and commercial fertilizers were not to be had. The forests were being denuded rapidly. The resultant food shortage caused in turn a sharp increase in disease (especially tuberculosis, rickets and "hunger-dropsy") and a general lowering of vitality.

Abroad the Norwegian government-in-exile in London decreed decisive action against all traitors as soon as the war permitted action. Nygaardsvold's government also, however, pledged that it would present itself to the people as soon as an election could be held, and stand or fall by the democratic verdict. The Norwegian merchant marine, though sadly depleted, continued to do magnificent service, as did the Norwegian air force, which claimed to have returned in full to Germany the tonnage of bombs which the Germans gave Norway in 1940. The Norwegian navy, especially the corvettes, was making itself effective against submarines, and an army was organized and ready for action.

Education.—In 1937–38 there were 357,793 students and 10,521 teachers in the elementary schools; 31,127 students and 1,809 teachers in the middle schools and gymnasia, and 16,033 students in continuation schools. The 11 universities had a combined enrolment of 4,998. The total state budget for educational purposes in 1939–40 was 65,364,000 kr.

Finance.—The monetary unit is the krone (23.4 U.S. cents in 1939). Budgetary income and expenses for 1937–38 balanced at

572,135,000 kr.; the proposed budget of 1939–40 was 595,627,000 kr. The government in London planned expenditures of 142,827,636 kr. in the first six months of 1941 and of about 92,000,000 kr. in the second six months of 1942. Nearly one-sixth of this was for payments on the state debt. Income was largely from the merchant fleet, requisitioned early in the war.

Trade.—In 1939 exports were valued at 808,172,000 kr.; imports, 1,361,835,000 kr. The imports rose rapidly in the last three months, while Norway built up stocks for the war period.

Communication.—In 1939 there were 2,335 mi. of state railways and 25,677 mi. of highways (11,857 mi. improved, 13,820 unimproved). In 1938 there were 107,657 motor vehicles. Norwegian air lines flew a total of 85,000 mi. in 1938. Telephones numbered 122,664; telegraph lines extended 21,875 mi.; radio receivers (licensed) numbered 400,623.

Agriculture.—The total value of agricultural products in 1938 was 384,207,000 kr.; of animal products (eggs, milk, wool, etc.), 428,000,000 kr.; furs, 30,000,000 kr. Landholdings numbered 562,407 (298,360 operating units) with a value of 2,410,101,000 kr. Leading crops were wheat 15,791,000 kr., rye 2,197,000 kr., barley 22,382,000 kr. and oats 31,479,000 kr. In 1938 total productive forest area was one-quarter of the total land area, or 18,700,000 ac.

Fisheries.—The total catch of fish in 1937 was 903,646 tons, the value of which was 92,272,000 kr.; 523,000 tons of the total was herring of various kinds.

Manufacturing.—In 1937 there were 4,306 establishments which turned out products valued at 2,023,551,000 kr. According to value of the product, the most important industries were food and tobacco 411,109,000 kr., paper, cellulose 309,733,000 kr., iron and metal 308,169,000 kr., mining 216,511,000 kr., textile 144,488,000 kr., and wood, furniture, etc. 140,756,000 kr.

Mineral Production.—In 1938 the principal mineral product was iron ore, valued at 26,665,000 kr. Pyrites, valued at 18,168,000 kr., and copper, valued at 5,013,000 kr., were respectively the second and third minerals.

Notre Dame, University of.

An institution of higher education at Notre Dame (South Bend), Indiana.

Principal gifts of the year were the $100,000 I. A. O'Shaughnessy Foundation in Fine Arts, the gift of $107,404 as the first annual alumni fund and a substantial bequest from the estate of Martin Gillen, Wisconsin lawyer.

The most significant academic changes were the great reduction in the number of civilian students and the introduction (July 1) of the navy V-12 program with 1,851 trainees, composed of apprentice seamen, Naval R.O.T.C. and marines. The United States navy reserve midshipmen school continued as a separate program housed and fed on the campus. The university's program of night courses in the ESMWT curricula also continued.

Thomas F. Woodlock of the *Wall Street Journal* was named Laetare medalist for 1943.

A nationwide commemoration of Notre Dame's 72 dead in World War II and 11 missing, was held in December by alumni. Five thousand Notre Dame men were in service.

Outstanding guest lecturer of the year was Roscoe Pound who delivered a series of lectures on "Fifty Years' Growth of American Law." New courses in air law and tax law were introduced. The university year, beginning with July, marked the new 48-week operation under the navy program. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Nova Scotia.

One of the three maritime provinces of the Dominion of Canada, admitted to the union in 1867; area 21,428 sq.mi.; pop. (1941), 577,962. Capital, Halifax (70,488); estimated wartime population 1943, 106,480. Other cities are Sydney (28,305) and Glace Bay (25,147) both centres of coal, iron and steel industries. The lieutenant governor in 1943 was H. E. Kendall; the premier A. S. MacMillan.

Education.—The number of students in provincially controlled schools in 1942 was 122,378; in private schools, 3,459; in institutions of university standard, 2,389.

Communication.—The mileage of surfaced highways in 1942 was 6,234; earth highways, 8,853; provincial expenditure on highways, $1,746,369. The railroad mileage in 1942 was 1,396; the number of telephones, 52,251.

Finance.—The ordinary receipts in 1942 were $16,443,946; ordinary expenditure, $15,497,608. The direct debt (less sinking funds) was $98,478,264; indirect liabilities (less sinking funds), $3,181,812.

Agriculture.—The acreage of field crops in 1943 was 519,600; gross value of field products, $16,316,000.

Table I.—*Leading Agricultural Products of Nova Scotia, 1942 and 1941*

Crop	1942	1941
Oats, bu.	2,622,000	2,356,000
Turnips, cwt.	3,920,000	4,020,000
Potatoes, cwt.	2,496,000	1,887,000
Hay and clover, tons	663,000	632,000

Manufacturing.—The gross value of manufactured products in 1940 was $113,814,650; net value, $40,548,446; number of employees, 21,062; salaries and wages, $21,519,617.

Table II.—*Principal Industries of Nova Scotia, 1939 and 1938*

Industry	Value of products	
	1939	1938
Steel works	$15,223,484	$11,183,267
Fish packing	6,531,571	6,471,510
Pulp and paper	5,523,373	5,033,523
Railway rolling stock	2,507,399	3,246,033
Sawmills	2,954,498	3,013,284

Mineral Production.—The value of the mineral production in 1942 was $31,652,244. The Inverness field had been closed.

Table III.—*Principal Mineral Products of Nova Scotia, 1940 and 1939*

Mineral	Value	
	1940	1939
Coal	$28,766,195	$25,611,271
Gypsum	1,302,347	1,340,830
Gold	855,432	1,082,170

Nursery Schools: *see* EDUCATION.

Nursing, War.

To meet the nation's critical wartime nursing shortage, the president of the United States, on June 15, 1943, approved the Bolton act, public law 74, which had been passed unanimously by the 78th congress.

Graduate nurses, responding to the call of the armed forces, had left the staffs of hospitals, health and welfare agencies, schools and institutions. War industries and public health agencies needed larger nursing staffs. The civilian shortage of nurses had reached dangerous proportions in war-boom areas. Hospitals, carrying peak loads of patients, were pressed for additional services

at the very time their staffs were being depleted. In short, the civilian hospital system of the country, early in 1943, was faced with a threatened collapse, due to the shortage of nurses.

The nurse training program, initiated in 1941 as part of the national defense health activities had been successful within the limitations imposed by law, but the need for more substantial government aid in the recruitment of nurses became acute when the army and navy issued a call for an additional 37,899 nurses in 1943.

Leaders in nursing, nurse education and hospital fields studied the problem and appealed for aid from government agencies concerned—army, navy, U.S. public health service, Federal Security agency, and Veterans' administration. Representing the consensus of all interested groups, the Bolton act was drafted with the full co-operation of the profession, after a series of conferences attended by representatives of the National Nursing Council for War Service, the American Hospital association and governmental agencies concerned.

Congresswoman Frances P. Bolton, Ohio, sponsored the act, "to provide the training of nurses for the armed forces, governmental and civilian hospitals, health agencies and war industries, through grants to institutions providing such training and for other purposes." Under this act, the U.S. cadet nurse corps was established. Federal funds were appropriated for carrying out a national nurse recruitment and nurse education program. In addition to undergraduate training, aid for graduate and refresher courses was authorized. Administration was placed under the U.S. public health service. Recruitment is carried on through the National Nursing Council for War Service.

The Federal Security administrator appointed an advisory committee to advise the surgeon general, U.S. public health service, concerning the rules and regulations authorized by law. The division of nurse education was established in the office of the surgeon general, to direct the program. Miss Lucile Petry, granted leave of absence from her position as dean of the Cornell university-New York hospital school of nursing, was appointed director.

A minimum of 65,000 new student nurses was set up as a national recruitment quota for the fiscal year, July 1, 1943, to June 30, 1944. The 1,255 schools of nursing accredited by the American College of Surgeons were invited to accelerate their curricula, expand their facilities and participate in the U.S. cadet nurse corps program. As of Dec. 31, 1943, 974 schools had applied and been approved for participation. The schools already accepted expected to admit 44,439 new cadets and to have a total cadet enrolment of 91,013 during the fiscal year 1943–44.

Under the provisions of the Bolton act, cadet nurses received complete nursing education through accelerated programs ranging from 24 to 30 months. The pre-cadet period was the first 9 months, the junior cadet period the next 15 to 21 months, depending on the school's curriculum. In those states and/or schools where regulations required 36 months for graduation, a senior cadet period was provided, during which the student practised nursing, under supervision, in the home school of nursing, or other civilian, military or governmental institution or agency. The choice was hers. In general, the standards of the National League of Nursing Education were used as a guide. Upon graduation, a cadet was eligible to become a registered nurse and to enter any field of nursing.

In addition to national recognition for rendering a war service, cadet nurses received full scholarships covering the cost of tuition, fees, books, maintenance, uniforms and monthly cash allowances: $15 during the pre-cadet period; $20 during the junior period; and at least $30 as a senior cadet.

Young women between the ages of 17 or 18, depending on state and school regulations, and 35, who are graduates of an accredited high school with satisfactory grades, and in good health, may qualify to become members of the U.S. cadet nurse corps. An increasing number of nursing schools are enrolling married students. Any member of the corps enrolled 90 days prior to the cessation of hostilities will be permitted to complete her training under the U.S. cadet nurse plan.

In return for advantages received through the corps, cadet nurses promise that, health permitting, they will remain in nursing, either essential civilian or military, for the duration. They are not required to pledge themselves to military service alone.

Corps members were not placed on the payroll of the federal government. Schools of nursing approved under the requirements of the Bolton act received allotments from the U.S. public health service to help meet the cost of equipping and instructing cadet nurse corps members. This was a grant-in-aid program.

The official outdoor uniform for 1943–44 of the corps included a gray wool suit, two gray and white striped cotton suits, a wool topcoat, a raincoat and berets to match the suits. Markings were regimental red epaulets and sleeve insignia. Silver buttons, lapel and epaulet insignia and cap device were also furnished. Indoor uniforms were those of the school attended. The woven insignia of the U.S. cadet nurse corps might be worn on the left sleeve.

The Bolton act provided postgraduate and refresher training to approximately 4,000 graduate nurses in the first six months of the program. Postgraduate programs in universities and colleges qualified graduate nurses for nursing service positions, faculty positions and specialized work in the various clinical fields. Refresher courses, designed to round out or make up deficiencies in basic nursing training, prepared inactive graduate nurses to return to practice.

A nursing section was established during 1943 in the procurement and assignment service of the War Manpower commission. This section had as its objectives (1) to procure nurses to meet the needs of the armed forces, having due consideration for civilian nursing needs; (2) to bring about the equitable distribution of the remaining nurses in order to maintain the best possible nursing service for the civilian population and non-military governmental agencies. (T. PN.)

Nutrition and Home Economics, Bureau of: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Nuts. The acreage of planted nut trees was estimated to be 565,000 ac. in 1942, having increased steadily from about 407,000 ac. in 1932. The principal nuts produced in the United States are pecans, walnuts, almonds and filberts. Pecans are much the most important and are produced chiefly in the southeastern states and Texas, while walnuts are grown in California and Oregon, almonds in California, and filberts in Oregon and Washington.

The pecan crop in 1943 in the 12 principal states was 114,747,000 lb. compared to 77,200,000 lb. in 1942 and a 10-year average 1932–41 of 91,113,000 lb. The 1943 crop was 15% above the average. Improved varieties yielded 49,223,000 lb. while the seedlings produced a crop of 65,526,000 lb. compared to 31,670,000 in 1942. The Texas and Oklahoma crops, consisting mostly of seedlings, were three times the light crop of last year; the Georgia crop, the largest in the southeast, was 17% smaller than last year's record crop of 26,500,000 lb.

The California walnut crop in 1943 was 57,000 tons, the same as in 1942, while the Oregon crop was 5,700 tons compared to

U.S. Production of Pecans by States, 1943 and 1942

State	Improved Varieties		Wild Varieties	
	1943 lb.	1942 lb.	1943 lb.	1942 lb.
Georgia	18,480,000	22,300,000	3,520,000	4,200,000
Alabama	8,300,000	7,900,000	2,200,000	2,000,000
Mississippi	5,300,000	3,100,000	3,700,000	2,300,000
Texas	4,200,000	1,500,000	23,800,000	8,800,000
South Carolina	3,000,000	2,700,000	450,000	400,000
Louisiana	2,620,000	1,900,000	6,880,000	4,500,000
Florida	2,579,000	2,700,000	1,945,000	1,900,000
North Carolina	2,380,000	2,200,000	320,000	300,000
Arkansas	1,200,000	900,000	3,400,000	2,500,000
Oklahoma	1,100,000	300,000	17,400,000	3,400,000
Missouri	52,000	20,000	1,348,000	580,000
Illinois	12,000	10,000	563,000	490,000

3,600 tons in 1942. The total crop of the two states was about 3% larger than in 1942 and 17% above the 10-year average of 53,440 tons. The California harvest was slower than usual and the quality of the nuts was reduced by an unusually large percentage of shriveled kernels.

The almond crop of California was 16,000 tons, which was 6,000 tons smaller than the 1942 record crop of 22,000 tons, but larger than the 10-year average 1930–39 of 12,590 tons.

The filbert crop of Oregon and Washington was 7,260 tons or 70% larger than the 1942 crop of 4,570 tons. The 10-year average was 2,397 tons. (*See* also COCO-NUTS; PEANUTS.) (J. C. Ms.)

Oakes, Sir Harry (1874–1943), British millionaire, was born Dec. 23 in Sangerville, Me. A gold prospector in his youth, he travelled throughout the world in search of ore for 15 years before striking a lode at Kirkland Lake, Ontario. He became a British subject in 1915, while he was a resident of Canada and when he moved to Nassau, Bahamas, in 1937, he became a citizen of that colony. Sir Harry, who was made a British baronet in 1939, was believed to have been one of the world's richest men. He was found dead, July 8, 1943, in his palatial Nassau home. Police investigators were called in, and it was disclosed that apparently the wealthy baronet had been beaten and clubbed to death. On July 10 the Nassau police arrested his son-in-law, Alfred de Marigny, who had married Nancy Oakes, daughter of Sir Harry. De Marigny was booked on charges of murder. His trial opened Oct. 18; the prosecution attempted to prove that the defendant clubbed his father-in-law to death because he feared he would lose his chance to share in the huge Oakes fortune. During the 22 sessions many lurid details regarding activities of the "fast set" in the Bahamas were revealed.

On Nov. 11, 1943, the jury hearing the murder charge voted nine to three for acquittal of de Marigny but also recommended his immediate deportation.

Oats. The oat crop of 1943 was estimated by the United States department of agriculture at 1,143,867,000 bu. compared with 1,349,547,000 bu. in 1942 and a 10-year average of 1,018,783,000 bu., 1932–41. This 15% decline from the previous year was due to lower yields, the average being about 30 bu. per acre in 1943 compared with almost 40 bu. in 1942, though above the 10-year average of 28 bu. Good harvesting weather in the western states favoured the yield and offset lower yields in central and eastern states. Stocks of oats carried over were less than a year earlier due to the great demand for feed resulting from the large increase in livestock numbers.

U.S. Production of Oats, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
Iowa	184,012,000	196,270,000	North Carolina	5,977,000	6,625,000

ZIMMER, HENRY ROBERT, German educator	Dec. 6, 1890	Mar. 20

O'Brien, Frank Michael (1875–1943), U.S. newspaper editor, was born March 31 in Dunkirk, N.Y. He made his journalistic start in Buffalo, worked up to reporter and later city editor of the Buffalo *Express*. He came to the attention of New York newspapers with his coverage of the assassination of President McKinley at the Buffalo exposition in 1901, and eventually was employed by the New York *Sun* in 1904. He gave up that job to become secretary to the mayor of New York city (1906–10). Returning to newspaper work, he was editor of the New York *Sun*, 1926–43. O'Brien wrote many short stories and won the Pulitzer prize for an editorial "The Unknown Soldier," which appeared in the old New York *Herald* in 1921. He also wrote *The Story of the Sun* (1918) and *New York Murder Mysteries* (1932), a compilation of celebrated New York crimes. He died in New York city, Sept. 22.

O'Day, Caroline Goodwin (1875–1943), U.S. congresswoman, was born June 22 in Perry, Ga. After graduating from Lucy Cobb institute, Athens, Ga., she studied art in Paris, Munich and Holland, and later won fame as a magazine illustrator and fashion designer. After her marriage, she took an active role in social work and was on the board of the Henry Street settlement. Mrs. O'Day worked diligently for women's suffrage and was regarded as the champion of labour and welfare organizations. After women won the right to vote, she joined the Democratic party organization in Westchester county and was leader of the Democratic women in New York from 1923 until her death. She was elected delegate-at-large to four Democratic national conventions, at several of which she headed the New York state delegation. An ardent supporter of President Roosevelt, Mrs. O'Day supported his New Deal policies during her tenure in congress as New York's representative-at-large, 1935–42. She refused, however, to vote for repeal of the arms embargo in the Neutrality measure, 1939, and voted against the Selective Service bill in 1940. She did, however, vote for a declaration of war after Pearl Harbor. Mrs. O'Day retired from politics in the summer of 1942, because of ill health, and died in Rye, N.Y., Jan. 4.

O'Hare, Edward Henry (1914–1943), U.S. naval air officer, was born March 13 at St. Louis, Mo. Known as "Butch," he attended Western Military academy, Alton, Ill., and was graduated from the U.S. Naval academy at Annapolis, 1937. In 1942, as a fighter pilot with the U.S. Pacific fleet, he was decorated with the congressional medal of honour by President Roosevelt for shooting down, Feb. 20, 1942, five Japanese bombers and for saving his carrier, the "Lexington," from destruction. He was later promoted to lieutenant commander. On Nov. 20, 1943, O'Hare was officially listed as missing. His group of carrier planes attacked a Japanese formation somewhere in the Pacific and his comrades reported that they believed his plane had been shot down.

Ohio. A north central state of the United States, popularly known as the "Buckeye state." Area, 41,222 sq.mi., including 100 sq.mi. of water; pop. (1940) 6,907,612, of whom 2,294,626 were rural and 4,612,986 urban; native white 6,047,265, foreign-born white 519,266, Negro 339,461, other races 1,620. Capital, Columbus (306,087). Other cities of more than 100,000 were Cleveland (878,336), Cincinnati (455,610), Toledo (282,349), Akron (244,791), Dayton (210,718), Youngstown (167,720) and Canton (108,401).

History.—The 95th general assembly convened Jan. 4, 1943 for what most of its members thought would be a short session, but which stretched out to 25 weeks with adjournment *sine die* coming on June 24. It was one of the longest biennial sessions in the state's history. About 200 bills of the 722 considered were enacted. Among the most important of those enacted were measures which: approved the highest appropriation bill in the history of the state to date; returned the state to Eastern Standard time; authorized liquor rationing; relaxed employment regulations for

females and minors; levied an unemployment surtax on pay rolls of manufacturers expanded by war production; provided prison terms for operators of the "numbers" gambling racket; permitted the state highway director to keep secret his engineers' estimates of highway costs and to award contracts in excess of bids; increased state subsidies for schools more than $5,000,000; required the state to relieve counties of the expense of caring for indigent patients in institutions for the feeble-minded; established a postwar planning commission and set aside about $23,000,000 for a postwar welfare building program; increased 1943–44 old-age pension funds by $10,000,000; and extended for two years the liquid fuel, cigarette and utility excise taxes.

Gov. John W. Bricker started his third term Jan. 11, 1943, the only Republican to be elected governor of Ohio three times in succession. In his inaugural address he advocated immediate repeal of the sales tax on food served in restaurants, a suggestion which the general assembly refused to adopt, and announced that the state's net surplus was about $42,000,000. On Nov. 10, 1943 Bricker formally announced that he would be a Republican candidate for president in the Ohio primaries, foregoing a bid for a fourth term as governor.

Other chief officers of the state in 1943 were: Lieut. Gov. Paul M. Herbert, Treasurer Don Ebright, Attorney General Thomas J. Herbert, Secretary of State Edward J. Hummel, Auditor of State Joseph T. Ferguson.

Education.—Ohio in 1943 had 3,828 elementary schools with a total enrolment of 704,477 and a total teaching staff of 21,385; 1,250 secondary schools (including 127 junior high schools) with a total enrolment of 448,988 (including 82,369 pupils in junior high schools) and a total teaching staff of 18,033 (including 2,768 junior high school teachers). Ohio had five state universities with a total enrolment of 25,478 and a total teaching staff of 1,561.

Public Welfare, Charities, Correction.—The average number of general relief cases in Ohio in 1943 was 16,142 and the total spent was $6,720,000; average number of cases of aid for the aged, 134,009 at a total cost of $47,000,000; average number of cases of aid to dependent children, 25,171 at a total cost of $5,727,950; average number of cases of aid to the blind, 3,560 at a total cost of $1,144,000; number of weeks of unemployment compensated (11 months) 117,991, the net amount of benefit payments being $1,430,324. In 1943 the four penal institutions had an average population of 7,077. The two industrial schools had an average population of 1,342. The 22 institutions, including hospitals for the insane and epileptics and homes for the feeble-minded, under the supervision of the department of public welfare, were operated during 1943 at a total cost of $12,000,000.

Communication.—Ohio had 88,895 mi. of highways in 1943 outside municipalities. Of this total, 18,490 mi. were classified as state, 28,409 mi. as county and 41,996 mi. as township. Estimated expenditures on the state highway system in 1943 were $32,000,000. The state had 8,870.26 mi. of railroads, 117 airports and landing fields and 1,580,239 telephones.

Banking and Finance.—There were 443 state banks in Ohio with deposits (Oct. 18, 1943) of $2,882,115,530 and resources of $3,089,632,463. There were 241 active national banks in Ohio with deposits (Oct. 18, 1943) aggregating $2,313,212,000 and resources $2,475,720,000. State-chartered savings and loan associations numbered 540 with total resources (June 30, 1943) of $697,151,689. There were 122 federal savings and loan associations with total assets (Jan. 1, 1943) of $267,634,451.

The state budget for the 1943–44 biennium was $369,034,569. At the close of 1943 Ohio had a surplus in excess of $68,000,000.

Agriculture.—The total acreage harvested in Ohio in 1943 was 10,505,000; in 1942, 10,359,500. Total value of crops in the state in 1943 was $417,391,000; in 1942, $369,756,000. Total value of livestock and livestock products in 1942 was $458,890,000. Total farm cash income in Ohio in 1942 was $599,831,000. Of this, $162,189,000 came from crops; $408,724,000 from livestock and livestock products; $28,918,000 from government payments. In spite of the handicaps of insufficient manpower, lack of mechanical equipment and unfavourable weather in the planting season, Ohio broke some of its production records in 1943 and maintained fifth place among the states in agricultural output.

Table I.—Leading Agricultural Products of Ohio, 1943 and 1942

Crop	1943	1942
Corn, bu.	174,042,000	185,752,000
Wheat, bu.	26,440,000	36,205,000
Oats, bu.	29,424,000	51,824,000
Barley, bu.	800,000	1,785,000
Rye, bu.	1,140,000	1,870,000
Soybeans, bu.	27,993,000	24,308,000
Potatoes, bu.	8,550,000	9,180,000
Apples, bu.	2,422,000	6,384,000
Tame hay, tons	3,505,000	3,659,000
Tobacco, lb.	21,067,000	24,056,000

Manufacturing.—The total value of manufactures in Ohio in 1939 was $4,584,665,659; total employment, 686,089; total wages and salaries paid, $1,033,426,673.

Mineral Production.—The total estimated value of mineral production in Ohio in 1942 was $167,207,457. (P. By.)

Table II.—Principal Mineral Products of Ohio, 1942 and 1941

Mineral	Value, 1942	Value, 1941
Bituminous coal	$69,200,000*	$58,344,497
Cement	12,517,870	11,988,884
Sand and Gravel	10,570,888	0,230,358
Stone	13,546,490	12,460,498

*Estimated.

Ohio State University. An institution of higher education at Columbus, Ohio. Formally established as a land-grant institution in 1870, it opened its doors on Sept. 17, 1873, to a student body of 17. The university admits both women and men. It has ten colleges: agriculture, arts and sciences, commerce and administration, dentistry, education, engineering, law, medicine, pharmacy and veterinary medicine; a graduate school; and five special schools: home economics, journalism, nursing, optometry and social administration. Graduate work is offered through the doctor of philosophy degree. Special curricula in 1943 prepared women for secretarial service and for homemaking. A new school of aeronautics was created. Latest additions to the physical plant were a 400-acre airport and a war research laboratory. The university for 20 years had operated on a four-quarter plan, enabling most students to complete their studies in three calendar years. For statistics of enrolment, faculty, etc., *see* UNIVERSITIES AND COLLEGES. Dr. Howard L. Bevis, president, took office Feb. 1, 1940. (H. L. B.)

Oil: *see* PETROLEUM.

Oils and Fats, Vegetable and Animal: *see* VEGETABLE OILS AND ANIMAL FATS.

Oklahoma. A west south-central state and the 46th of the United States. The people of the state are popularly known as "Sooners," from the name applied to those who crossed the starting line sooner than the time fixed by the government for the first land run into Oklahoma, April 22, 1889. Area, 69,919 sq.mi., including 636 sq.mi. of water; pop. (1940) 2,336,434. The rural population numbered 1,456,771; urban, 879,663. Approximately 87% was native white, 7% Negro, 4% Indian and 2% foreign born, Mexican and miscellaneous. The state's two largest cities are Oklahoma City (204,424), the capital, and Tulsa (142,157).

History.—The administration of Governor Leon C. Phillips ended with the beginning of 1943. At the Nov. 1942 election, Robert S. Kerr had been chosen to succeed Phillips as governor. Others elected were: lieutenant governor, James E. Berry; secretary of state, Frank C. Carter; state auditor, C. C. Childers; attorney general, Mac Q. Williamson; state treasurer, A. S. J. Shaw; state superintendent of public instruction, A. L. Crable.

Education.—In the public schools in 1941–42 (latest figures available in 1943) 528,293 pupils were enrolled, with 19,390 teachers. Of these pupils, 128,603 were enrolled in the 854 high schools. The expenditure for the maintenance of public schools, elementary and secondary, during the fiscal year amounted to $32,015,747. The state maintained a university at Norman, a state agricultural and mechanical college at Stillwater, the Panhandle Agricultural and Technical college at Goodwell, two junior agricultural and mechanical colleges, four agricultural and mechanical colleges, a college for women, five state colleges primarily for teachers, an agricultural, mechanical and normal university for Negroes at Langston, an institute of technology at Weatherford, a military academy and one college preparatory school and junior college. There were 19 junior colleges with municipal support. In addition, there were six accredited senior colleges and three junior colleges with church affiliations.

Public Welfare, Charities, Correction.—As of Jan. 1944, 77,160 persons were the recipients of old-age assistance, 1,944 blind persons received aid, and 13,890 families were given aid for 33,209 children. The hospitals and eleemosynary institutions in 1943 included three tuberculosis sanitariums, five mental hospitals, two orphans' homes, one school for the deaf and one for the blind. There was also one penitentiary, one reformatory and four schools of detention and correction.

Communication.—Oklahoma contained approximately 101,000 mi. of state and rural highways in 1942, not including streets in towns and cities. Annual expenditures for roads were approximately $23,000,000. Within the state at the end of 1943 there were 6,150 mi. of railroad.

Agriculture.—The year 1943 was marked by severe floods in the eastern part of the state in the spring and an extended drought in the late summer.

Leading Agricultural Products of Oklahoma, 1943 and 1942

Crop	1943	1942
Wheat, bu.	31,711,000	57,370,000
Corn, bu.	23,350,000	35,631,000
Broomcorn, tons	8,800,000	11,900,000
Grain sorghums, bu.	5,355,000	10,614,000
Barley, bu.	3,750,000	10,625,000
All hay, tons	1,657,000	1,990,000
Cotton, bales	385,000	708,000

Manufacturing.—Total value of manufactures in 1939, the year of the last federal biennial census of manufactures before World War II, was $312,168,499. State industries employed 33,528 persons; salaries of $11,090,299 and wages of $30,465,185 were paid.

Mineral Production.—The total value of mineral production in 1941 was estimated at $260,000,000, as compared with $236,000,000 in 1940. Petroleum production declined in 1941 and 1942 in some of the older pools, but the number of new pools and extensions was developed. (J. W. Mt.)

Olds, Robert (1896–1943), U.S. army air officer, was born June 15 in Woodside, Md. During World War I, he was flying instructor in the United States and at the Clermont-Ferrand instruction centre, France, where he was made officer in charge of training. After the war, he served in the Hawaiian department and with the War Plans Division office of the chief of air corps. One of the army's early exponents of heavy bombardment, he was later given command of the 2nd bombardment group at Langley Field, Va. While at that post, he was assigned to lead two good-will missions of Flying Fortresses on nonstop flights to South America, 1938, 1939—for which he received the D.F.C. In June 1941, he was given the task of organizing the ferry command and supervising delivery of bombers to England. In recognition of his success, he was promoted to brigadier general and received the D.S.M. In 1942, he was advanced to major general and put in command of the 2nd air force, with headquarters at Fort George Wright in Washington. Ill health forced him into inactivity in Feb. 1943, and he died at Tucson, Ariz., April 28.

Oleomargarine (Margarine). The production of oleomargarine in the United States reached a record high point in early 1943 but declined sharply almost to the level of 1942 following fat rationing in March. The use of fats and oils in oleomargarine for civilian use had been subject to government restriction since Sept. 1942. The total production of oleomargarine had been fairly constant since 1934, fluctuating between 260,000,000 and 320,000,000 lb.

The increase in 1942 brought the total to the record high point of 426,000,000 lb. and the total for 1943 was expected to reach 650,000,000 lb.

Scarcity of butter caused an increase in oleomargarine manufacture to the maximum permitted, which would be 167% of average production in 1940 and 1941. The coloured oleomargarine was produced almost entirely for export while the uncoloured production was for domestic civilian consumption. The coloured production had been only a small part of the total in recent years, less than 1% on the average, because of the heavy tax on its manufacture. This federal tax was 10 cents per lb. on coloured oleomargarine and ¼ cent per lb. on the uncoloured product with exports tax-free. The federal tax was controlled by the bureau of internal revenue, which issued all permits for withdrawal for export or domestic consumption. The growing demand for a butter-substitute in 1942 led to an increase in the proportion of coloured oleomargarine produced and by July 1943, the coloured proportion rose to about 50% of the total. This relationship was not expected to continue, however, and showed a decline in the later months of 1943. The materials used in the manufacture of oleomargarine were principally cottonseed oil, soybean oil, milk and oleo oil. The use of such tropical vegetable oils as coco-nut oil, palm oil, etc. ceased when the supplies of these were cut off by the war in the Pacific. Proposals to repeal the tax on oleomargarine were made in congress and aroused vigorous opposition by dairy farmers and others interested in preventing the use of butter substitutes.

Legislation taxing and otherwise controlling the manufacture of oleomargarine had been in effect since 1900.

(J. C. Ms.)

Olivier, Sydney Olivier, 1st Baron, of Ramsden (1859–1943), British statesman, was born April 16. The former secretary of state for India (1924), was known as the "foster parent of the Labour party," and was an active member and officer of the Fabian society in the late '80s. He died at his home, Wychwood, Bognor Regis, Feb. 15. (See *Encyclopædia Britannica.*)

Oman and Muscat: *see* Arabia.

Onegin, Sigrid (1891–1943), German-Swedish opera singer, was born June 1 in Stockholm of German parents. She studied voice in Germany and Italy and later with her husband, Baron Onegin, Russian composer. The statuesque young singer made her operatic debut in Stuttgart in 1912 as Carmen singing opposite Enrico Caruso, and during her first season there appeared in 12 different operatic roles. She gained her reputation, however, in such Wagnerian roles as Erda, Brangaene, Fricka and Waltraute. In her later years she developed her rich, velvety contralto voice so that she was able to add bright coloratura soprano roles to her repertoire. She was discovered by Giulio Gatti-Casazza while singing with the Munich Opera company and taken to America to make her operatic debut at the Metropolitan in *Aida,* 1922. From 1926 to 1933, she was a member of the Berlin Opera and afterwards went to live in Zurich. She made her final New York appearance in a recital in 1938. She died in Magliaso, Switzerland, according to a Berne report of June 18.

Ontario. One of the two central provinces of the Dominion of Canada (*q.v.*), admitted to the union in 1867; area, 412,582 sq.mi.; pop. (1941) 3,787,655. Capital, Toronto (667,457). The population in 1941 was 80% native born and 62% urban. The lieutenant governor in 1943 was Albert Matthews; the premier G. A. Drew.

Education.—The number of students in provincially controlled public schools in 1942 was 708,180; in private schools 21,264; in institutions of university standing 19,185.

Communication.—The mileage of surfaced highways in 1942 was 56,309; of earth highways 16,137; provincial expenditure on highways $16,081,059. The railroad mileage in 1942 was 10,562, number of telephones 660,002.

Finance.—The ordinary receipts in 1942 were $106,384,870; ordinary expenditure $109,618,967. The direct debt (less sinking funds) was $729,815,356; indirect liabilities (less sinking funds) $129,603,233.

Agriculture.—The acreage of field crops in 1943 was 10,089,000; gross value of field products $208,357,000.

Manufacturing.—The gross value of manufactured products in 1940 was $2,302,014,654; net value $1,004,529,583; number of employees 372,643; salaries and wages $479,399,188.

Mineral Production.—The value of the mineral production in 1942 was $258,423,267. (J. C. He.)

Table I.—*Leading Agricultural Products of Ontario, 1942 and 1941*

Crop	1942	1941

Oppenheimer, Franz (1864–1943), German sociologist and political economist, was born March 30 in Berlin. He took his medical degree from the University of Freiburg. Convinced that he could do more for the general well-being of his patients by improving their social and economic conditions, he quit his medical practice, returned to school and graduated with a Ph.D. in economics and sociology at the University of Berlin. He wrote widely and was best known for a short book, *The State* (1908), which was translated into many languages, and for his *System of Sociology,* a four-volume work (1922–29). Oppenheimer, who advocated the partitioning of the large Junker estates in Prussia, launched several co-operative communities in rural areas in an effort to demonstrate that poverty and mass unemployment could be solved if proper social remedies were applied. After the advent of Hitlerism, he fled Germany and lectured at the University of Kobe, Japan. He was admitted to the United States and became research associate of the University of California in 1938. He died in Los Angeles, Sept. 30.

Oranges. Total United States production of oranges, including tangerines, for the 1943–44 season was estimated at 96,290,000 boxes by the United States department of agriculture, which was 8% more than the large production of last year and 13% above the production of 1941–42. The Florida crop of oranges and tangerines was 22,000,000 boxes, of which 3,200,000 were tangerines. Shipments were nearly double the movements of the previous year to the same date. A strong demand, partly due to the smaller crop of apples, resulted in relatively high prices. Army and lend-lease requirements were strong particularly for juices and other processed forms. (J. C. Ms.)

U.S. Production of Oranges by States, 1943 and 1942

State	1943 Loxes*	1942 boxes*
California		
Valencias	30,800,000	30,055,000
Navels and miscellaneous	18,530,000	14,241,000
Florida		
Early and midseason	22,000,000	19,100,000
Valencias	17,500,000	18,100,000
Tangerines	3,200,000	4,200,000
Texas	3,100,000	2,550,000
Arizona	900,000	730,000
Louisiana	260,000	340,000

*Net content per box of oranges in California and Arizona approximates an average of 77 lb.; in Florida, Texas and other states, 90 lb.

Oregon. A Pacific state of the U.S.A., admitted to the union Feb. 14, 1859. Area, 96,350 sq.mi.; pop. (1940) 1,089,684. Capital, Salem (30,908); chief city, Portland (305,394).

History.—Oregon made a substantial contribution to the war effort in 1943 in ship construction. Six major yards in the Portland area, including Vancouver, Wash., launched 356 steel ocean-going vessels. The total of 3,222,375 tons was estimated as being nearly one-sixth of the nation's production outside of yards building wholly for the navy. These new ships when ready for service would have an estimated value of $837,000,000. About 115,000 men and women were employed in their construction.

The three Maritime commission yards operated by the Kaiser

organization launched 272 steel vessels, totalling, 3,126,000 tons. Of these 25 were for the navy and the others were cargo and tank ships. Three smaller yards in Portland operating under navy direction launched 84 vessels, mostly of smaller sizes but some of complicated design. In addition to the ships launched, there were many repair and conversion projects in the Portland area, including seven aircraft escort carriers. A variety of marine construction was carried on at Astoria, Coos Bay and other places not included in the above figures. In 1942, the Portland area yards launched 193 vessels, totalling 1,360,000 tons.

In the fall of 1943 the Oregon Shipbuilding corporation began construction of the first of the new Victory ships. The first ship in this series, the "United Victory," was launched in Portland on Jan. 12, 1944.

Another important contribution to the war effort in Oregon was the production of lumber. While much of this went into direct military construction, there was a greatly increased demand for crating and box material. Packing requirements for overseas shipments increased tremendously.

Three large army camps were operated in 1943, as well as a number of smaller army and navy establishments. In the summer and fall of 1943 central Oregon was the scene of extensive army manoeuvres with about 75,000 troops, drawn from the Pacific coast area.

The Oregon legislature met in Jan. 1943. Total appropriations for the biennium of 1943–45 amounted to $23,723,365, an increase of about $2,800,000 over the previous biennium. An act was passed providing for a reduction in the state personal income tax rates as the taxable income increased in volume. Late in 1943, the state tax commission announced that the rate applicable for the 1943 tax would be reduced by 75%.

The legislature also referred a sales tax proposal to a popular vote to be held at the general election in Nov. 1944.

Housing problems in the Portland metropolitan area and in other Oregon communities were not entirely satisfactory, but many new housing units were made available and the tension was greatly relieved.

The year 1943 was Oregon's centennial year for the first large immigration over the Oregon Trail in 1843. Extensive celebrations were impracticable on account of war conditions, but many local meetings were held.

A number of Portland public and civic organizations subscribed a fund of $100,000 in 1943 and employed Robert Moses of New York city to investigate Portland's postwar problems. Moses and his staff spent much time in Portland and late in the year presented a detailed plan calling for the expenditure of $75,000,000 for postwar projects. Most of these projects were designed to improve local traffic conditions.

Education.—During the school year 1941–42 there were 214,640 pupils in public schools, including 60,503 in high schools. There were 7,997 teachers. For the school year 1941–42 the value of school properties was $62,160,201.

Communication.—On December 31, 1943, there were 4,806 mi. of primary state highways, of which 4,612 were surfaced. Highway expenditures for 1943 were $13,504,005, of which $2,470,246 was for interest and debt retirement. As of Dec. 31, 1942, there were 3,662 mi. of steam railways, not including second main track, sidings, etc.

Finance.—As of Nov. 1, 1943, Oregon's state gross bonded debt was $24,089,425, against which there were sinking funds and other applicable assets amounting to $17,382,149, leaving a balance of debt of $6,707,276.

Agriculture.—The total cash income of Oregon farmers in 1942 was $213,642,000, of which $6,585,000 represented government payments.

Principal Agricultural Products of Oregon, 1943 and 1942

Crop	1943 (est.)	1942	Crop	1943 (est.)	1942
Corn, bu. . . .	1,862,000	1,742,000	Barley, bu. . .	9,125,000	10,075,000
Oats, bu. . . .	11,020,000	10,064,000	Wheat, all, bu..	19,500,000	19,953,000

Manufacturing.—The census of 1939 showed 2,248 manufacturing establishments in Oregon; 69,880 persons employed; salaries and wages, $91,326,581; value of products, $365,374,436. Major items: logging camps, $23,363,038; sawmills, $108,663,140; planing mills, $8,122,845; meat packing, $15,178,448; paper mills, $15,698,747. (L. A. McA.)

Orlebar, Augustus H. (1897?–1943), British air officer, was born at Higham Ferrers, Northamptonshire. He became a test pilot during World War I, later studied at the R.A.F. staff college from which he was graduated in 1926. He was leader of British aviators who competed for the Schneider cup in 1929 and 1931 and set a speed record of 357.7 miles per hour in the 1929 meet. In World War II, he commanded an R.A.F fighter group on cross-channel sweeps and directed flight training. An acting air vice marshal, he was made deputy chief of combined operations in March 1943 and was third in command of the service headed at that time by Lord Louis Mountbatten. He died in London, August 4.

OSRD: *see* SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF.

Osteopathy. Research work continued to be a feature of osteopathic progress, the most important publications during 1943 relating to physiological problems. Steps were taken for closer correlation of activities and exchange of information among those engaged in research.

The osteopathic profession in 1943 set an all-time record in the number in the profession, 10,820, and likewise in membership in the American Osteopathic association and in the divisional (state and provincial) societies. The annual meeting at Detroit was a war service conference, and the 1944 meeting to be held in Chicago was to be of the same nature.

Additional boards were set up for the certification of those who practice specialties, the complete list of boards now including examiners in pathology, internists, neurology and psychiatry, obstetrics and gynaecology, ophthalmology and otolaryngology, pediatrics, proctology, radiology, surgery (with a sub-board on anaesthesiology).

Funds appropriated for the army and the navy included provision of osteopathic care for personnel in those branches. In reacting to this situation, and undertaking to maintain and increase the quality of osteopathic physicians and surgeons available, the osteopathic colleges went beyond the provisions already made for expansion. All of them were adding to laboratories and libraries, and increasing their faculties in 1943, and some building programs were getting under way. (R. G. HU.)

Ottawa. The capital of the Dominion of Canada (*q.v.*) and the seat of the supreme court, is situated on the right bank of the Ottawa river near the mouth of the Rideau, both rivers having very beautiful falls. The city itself is divided into an upper and a lower town by the Rideau canal. The parliament buildings are situated on a series of high bluffs which overlook the river, in one direction toward the Chaudière falls and in the opposite direction toward the Rideau falls. The population of the city was 154,951 in 1941. The gross value of manufactured products in 1941 was $28,582,935. The city's most important educational institution is the Université d'Ottawa.

Oxford University.

The academic year 1942–43, which began with 2,615 undergraduates in residence, ended with 2,728. The numbers of men matriculating in Hilary (218) and Trinity terms (399) were much above even the high figures of the previous year. Sixty-nine per cent of the men matriculating were below the age of 18½. This was a substantial increase over the previous year's figure, but there were indications that the proportion would in the future be constant at about 70%.

For the first time the regulations calling up for national service caused many women (302) to enter for the special wartime examinations in Trinity term 1943. Unlike men, most women would not be liable to be called up at the end of a bye-term but would normally stay up for two full academic years. Most of the occupations upon which they would then enter, having been approved by the Minister of Labour, would probably be reckoned as national service for the purpose of qualifying for war degrees.

Scholarship examinations in classics and history were held by one group of seven colleges in September, 1943; another group of seven examined in Dec. 1943; and the third group (six colleges) were to examine in March 1944. The dates of examinations in other subjects were not affected by the war.

A standing committee of scientists with some lay members was appointed to advise on biological problems affecting estate management. This committee was modelled on the committee on building problems of which the establishment was recorded in 1942. The university and colleges are among the biggest owners of agricultural land in the country.

Benefactions, apart from those which renewed existing grants, included £10,000 from Mr. and Mrs. P. Vaughan Morgan in memory of their daughter Violet to endow scholarships in English literature, and a bequest of £12,000 from Dr. H. E. D. Blakiston for the purchase of works of graphic art. The university also acquired partly by gift from R. W. Ffennell and partly by purchase from him 2,840 ac. (out of 3,108) of the Wytham abbey estate. In Oct. 1943 the numbers of matriculations were 991 men and 335 women. (D. V.)

Pacific Islands, British.

Territories of the British empire in the Pacific ocean, of which certain statistics are given in the accompanying table. *See* BRITISH EMPIRE for population, capital towns, status and governors.

History.—Fighting continued throughout the year with the Allied offensive in New Guinea and the Solomons, and most of the central Solomons were regained; in November the U.S. Marines retook the Gilbert islands after a fierce 76-hour battle. (*See* WORLD WAR II.) In May the Colonial office published a report from the high commissioner, Sir Philip Mitchell, giving an account of the loyalty of the Solomon Islanders, during the Japanese occupation, to Col. Marchant, the British resident commissioner, and the other Europeans who remained on the islands. Japanese attempts to ingratiate themselves with the natives failed completely; and when the Allied offensive began, the islanders proved invaluable scouts and played a conspicuous part in the fighting.

Measures were being undertaken in the liberated areas to repair the damage done by the Japanese. On July 20 O. C. Noel, former administrative officer, Uganda, was appointed to succeed Col. Marchant as resident commissioner of the Solomons. The Japanese had exterminated whole villages in an attempt to coerce the natives into working for them, and an anthropologist was dispatched to the islands to help the native communities to reorganize themselves. There was urgent need for the re-establishment of adequate medical services as there had been serious outbreaks of disease during the Japanese occupation.

It was also important to get the vegetable gardens and plantations back into production and an agricultural officer toured the most seriously devastated areas to supervise the work of replanting.

On April 23 the U.S. Navy department announced that U.S. forces were in occupation of the Ellice Islands on the supply line to the S. Pacific and Australia, and subsequently the islands were frequently bombed by the Japanese. Japanese positions in the N. Gilbert islands, particularly the island of Tarawa, were attacked several times by Allied aircraft before U.S. forces recaptured the islands Nov. 23 in an assault which cost the U.S. Marines more than 1,000 dead and more than 2,500 wounded in a total force of 4,000–5,000. The Japanese garrisons were virtually annihilated.

In Fiji the labour welfare board continued its work of endeavouring to raise the standard of living, while improving the health services. Defense preparations continued, and early in the year the first battalion of the Fijian Infantry regiment left for the battle areas.

On June 1 Major Ratu J. L. V. Sukuna was appointed adviser on native affairs in Fiji, a post carrying with it membership on the Executive council. He was the first Fijian civil servant to attain so high a post.

On Oct. 11 Queen Salote of Tonga celebrated the Silver Jubilee of her coronation. (*See* also SOLOMON ISLANDS.) (C. M. CL.)

Pacific Islands, Mandated.

The former German possessions in the western Pacific comprise part of New Guinea with adjacent archipelagos, Western Samoa, the Marshall, Caroline, Palau and Ladrone, or Marianne islands, and the islet of Nauru. Statistics for these territories are given in the accompanying table. For capital towns and governors of New Guinea, Western Samoa and Nauru, *see* BRITISH EMPIRE. After the Japanese entry into the war in 1941, these islands became the scene of hostilities, for which *see* WORLD WAR II. (*See* also NEW GUINEA.)

Pacific Islands, U.S.

In addition to such large island possessions in the Pacific as Hawaii, the Aleutians, American Samoa and Guam (the latter occupied by the Japanese in 1943) the United States possesses a dozen tiny islands in the Pacific, negligible in size and economic value, but important, both in peace and in war, from the standpoint of aviation and naval security. Increasing interest was shown in these formerly neglected islets in the later '30s, as air flights across the Pacific were organized on a regular commercial basis and as the threat of war with Japan became more evident.

U.S. LIBERATOR BOMBER over the Japanese-held island of Nauru. Clouds of smoke are rising from three phosphate plants bombed during a raid April 21, 1943

Midway and Kure (Ocean) Islands.—The Midway Islands are a group in the North Pacific, 1,200 mi. northwest of the Hawaiian Islands. Area of the group: 28 sq.mi. Pop. (1936) 118. Midway consists of two low-lying islands, Sand (area 850 acres) and Eastern (328 acres). These are surrounded by a coral reef five miles in diameter and by numerous islets. Sand and Eastern islands are little more than sand-spits, but they acquired importance, first as the site of a trans-Pacific cable station (installed 1903), second as a stopping point on the Pan American Airways route from San Francisco to the Philippines via Hawaii, Midway, Wake and Guam (inaugurated 1935), third, as an important U.S. air and naval station in the war against Japan. One of the first big Japanese defeats was sustained in a three day battle in the neighbourhood of Midway, fought June 4–6, 1942.

Midway was discovered by a Captain N. C. Brooks in 1859 and was first known as Brooks Island. The name was later changed to Midway, because of the group's position in the mid-Pacific, 2,800 mi. from California and 2,200 mi. from Japan. It was formally declared a U.S. possession in 1867. Kure (Ocean) Island is a coral reef 14.7 mi. in circumference, lying 56 mi. northwest of Midway. It was placed under the control of the navy department by an executive order of Feb., 1936.

Wake Island.—Wake Island, famous as the scene of a gallant last-stand defense by a garrison of a few hundred U.S. marines against a greatly superior Japanese attacking force in Dec. 1941, consists of three islets, Wake, Peale and Wilkes, and is located in the North Pacific, 2,130 mi. due west of Honolulu. The total land area of the islets is about 2,600 acres (4 sq.mi.), Wake, the largest, being about 2 sq.mi. It was formally annexed to the United States on Jan. 17, 1899. For many years it was neglected and uninhabited, except for occasional visits of Japanese bird-hunters; but it was placed under U.S. navy department jurisdiction in 1934 and later contained an air station, a hotel for air travelers and quarters for a small garrison of marines. It was discovered by the British ship, "Prince William Henry," in 1796.

Johnston Island.—Johnston Island consists of two islets on an eight-mile reef, located 600 mi. southwest of Hawaii. It was discovered by the British naval vessel "Cornwallis" in 1807 and named after the vessel's captain, Charles James Johnston. Competing U.S. guano interests lent some activity to this barren sand bar in the '50s and '60s of the 19th century. The final U.S. assertion of claim to the island was an Executive Order of June 29, 1929, placing the island under the control and jurisdiction of the department of agriculture as a refuge for native birds. An appropriation of $1,150,000 was provided by congress for the construction of seaplane facilities.

Kingman Island.—Kingman reef, 150 ft. long by 120 ft. wide at high tide, is the smallest land area in the world over which the United States claims sovereignty. The reef is about 8 mi. long and 5 mi. wide, counting in submerged shoals. Two other tiny islets in the reef appear at low tide. The strategic importance of this desolate reef lies in the fact that it is the only possible seaplane base between Honolulu (1,067 mi. to the N.) and Pago Pago, in American Samoa (*q.v.*), 1,797 mi. to the S.W.

Palmyra Island.—A U-shaped atoll, with its 53 islets containing an area of about 500 acres, located 960 mi. S.W. of Hawaii. Its possession was disputed for a time between the United States and the kingdom of Hawaii; it was specifically mentioned when the U.S. annexed Hawaii in 1898; but sporadic British claims to the possession of the island were put forward later. It is a possible air base on the route from Hawaii to New Zealand.

Swains Island.—A coral atoll, one sq.mi. in area, pop. 150, of Polynesian race, formally brought under the jurisdiction of American Samoa in 1925 after remaining for a time under the patriarchal rule of a U.S. whaling captain named Eli Jennings, who had himself accepted as a local chief, and his descendants.

Howland, Jarvis and Baker Islands.—Baker and Howland Islands are small coral atolls, located where the international date line crosses the equator. Jarvis Island is 1,150 mi. further E. and slightly below the equator. Rectangular Baker Island is 1 mi. long and 1,500 yd. wide, elongated Howland Island is 2 mi. long and 750 yd. wide. Both were discovered by U.S. whaling captains early in the 19th century. Jarvis Island, a bare coral plateau, 1.8 mi. long and 1.3 mi. wide, was discovered in 1821. These islands were "colonized" by students of a Hawaiian boys' school in 1935 and placed under the jurisdiction of the depart-

WAKE ISLAND was the target of one of the most concentrated and devastating air raids of World War II Oct. 5–6, 1943, when U.S. naval planes and ships rained more than 700 tons of bombs and shells on the Jap-held base

ment of the interior in 1936. Radio and aerological stations were established there.

Canton and Enderbury Islands.—Geographically part of the Phoenix group and located 1,850 mi. S.S.W. of Hawaii, Canton (area 8.5 sq.mi.) and Enderbury (2.5 sq.mi.) figured in a prolonged dispute as to ownership between the U.S. and the British empire. Aviation experts consider Canton an excellent base for seaplanes and Enderbury suitable for land planes. The dispute was settled on Aug. 11, 1938, when the United States and British governments jointly announced an arrangement for "the use in common" of the islands, "for purposes connected with international aviation and communication." (*See* also GUAM; HAWAII; PHILIPPINES; SAMOA, AMERICAN.) (W. H. CH.)

Pacifism. The arrangement between the United States Selective Service administration and the National Service Board for Religious Objectors, representing the Friends, Mennonite and Brethren churches, the Federal Council of Churches of Christ in America, the Association of Catholic Conscientious Objectors, the interdenominational Fellowship of Reconciliation and other religious groups, under which alternative civilian service is performed by draftees recognized as sincere conscientious objectors was continued during 1943. At the end of the year about 7,000 such men were in Civilian Public Service. Sixty per cent of this number were in camps engaged mainly in forestry, soil conservation, prevention and fighting of forest fires. These men not only received no pay but had to provide their own maintenance or had to have it provided for them by the religious agencies administering Civilian Public Service. To meet the objection of a considerable number of conscientious objectors to serving under a "religious" or denominational agency, the Selective Service administration opened a camp under its own management at Mancos, Colo. Conscientious objectors could elect whether to serve under religious agency or direct government management.

The remainder of Civilian Public Service men were on "detached service," more than 1,000 in mental hospitals from which considerable success in the application of pacifist techniques was reported. Several other groups served as "guinea pigs" in experiments in typhus control, treatment of pneumonia, control of salt water intake by shipwrecked persons, and other problems, under the direction of universities or research agencies. These men received their maintenance but no pay.

Much dissatisfaction over failure of the government to provide pay and at least maintenance for all conscientious objectors (C.O.s) who did not deliberately choose to donate their services and maintenance developed. As the draft of fathers went into effect, an acute situation arose for a considerable number of dependents of conscientious objectors. Criticism increased when the comptroller general ruled that wages paid by private farmers to conscientious objectors in Civilian Public Service who volunteered to relieve labour shortages had to be paid over to the treasury of the United States. The only concession granted was that such money should be held in a separate account, the disposition of which was to be determined after the war.

The religious agencies under which most C.O.s served complained that the Selective Service administration was intervening to such an extent in the discipline in Civilian Public Service camps as to place the agencies in the position of becoming instruments of coercion. Great disappointment was also felt when, after President Roosevelt himself had authorized organization of a C.O. unit for difficult and dangerous relief and rehabilitation work in China, a "rider" to a congressional appropriation bill forbade the use of any federal funds either for work of C.O.s abroad or for any training for such work.

During the year the department of justice reported that of the 6,116 persons convicted up to June 30, 1943, of violations of the Selective Service act, it listed 2,071 as conscientious objectors. Of that number 1,630 were still in prison on that date. This included 964 Jehovah's Witnesses, however, who seek status as ministers of religion rather than as conscientious objectors. The latter included a considerable number of men generally admitted to be sincere but regarded as not qualifying as conscientious objectors by virtue of "religious training and belief," who refused induction into the army but were eager to render alternative service under civilian auspices. Two types of parole are theoretically open to conscientious objectors in prison, a special parole under the Selective Service act and the general parole available to federal prisoners on the expiration of one-third of their term. In practice, however, very few were granted. Furthermore, a considerable number of C.O.s who had already completed a term, on refusal to abandon their "absolutist" position, were convicted a second time and returned to prison. Such developments, as well as the censorship of mails in federal prisons and the practice of segregation of Negro and white inmates, led to work-strikes on the part of a minority among imprisoned C.O.s and also to hunger-strikes, lasting in at least two instances for many weeks with the authorities resorting to forcible feeding.

Public concern over many of these developments led to the formation during 1943 of a National Committee on Conscientious Objectors by the American Civil Liberties Union. It took steps to test a number of issues in the federal courts. In general, however, there was no governmental interference with the work of pacifist churches or other agencies.

Paddock, Charles William (1900–1943), U.S. editor, track star and marine corps officer, was born Aug. 11 in Gainesville, Tex. Known as the "world's fastest human" in the '20s, Charlie Paddock held the National A.A.U. record for the 100-yard outdoor sprint, 0:09.6, in 1921 and 1924. He also set a national record for the 220-yard run on an outdoor track in 1924. He represented the U.S. at the Olympic games at three different times, but only at Antwerp in 1920 did he succeed in beating his competitors in the 100-metre race. In private life Paddock was manager of two California newspapers. Commissioned a captain in the marine corps in July 1942, he served on the staff of General Upshur as aide and public relations officer. He was killed in the crash of a naval aeroplane at Sitka, Alaska, which took Gen. Upshur and four others to their death, July 21.

Painting. In spite of the limitations imposed by war conditions, painting in the United States during 1943 showed a notably increased vitality. Several factors played their part in this. Thanks to war needs, there was a definite narrowing of the nation's art production with a healthy trimming away of the less convinced aspirants. It is true that the war exerted a severe drain on the art schools of the country. It took several of the most promising younger painters temporarily away from their easels. But it also provided other work for many, young and old, who painted more by avocation than from inner necessity. And the essentially propagandist illustrators of "the American scene" and "social" or "party-line" schools that had flour-

"GREGOR PIATIGORSKY" by Wayman Adams of New York city won first prize at the U.S. exhibition of the Carnegie institute at Pittsburgh, Pa. in Oct. 1943

ished in the '30s found more remunerative and honorific fields for their abilities outside the fine arts. Pictorial imagination once more began to show itself more freely. With Pearl Harbor, domestic interest in the "social" school of art had faded. Emphasis on "the American scene" had long since lost its shibboleth value. Pictorial "realism" at its starkest could not rival the grim realities reproduced photographically in the newspapers. Painting was thrown back on a fuller exploitation of its own means of expression and for subject matter on the romantic imagination. The refugee artists whom naziism had driven to these shores had begun to take a place in their new world. Their first unfamiliarity with the new scene had worn off; they had begun to respond to their new environment, or at any rate to work less self-consciously in it. The younger Americans had now had time to become acquainted with the work of these Europeans produced in their midst and many were beginning to take profitable lessons from it. An increased public buying power, untapped by foreign markets, afforded a substantial encouragement to the artists through increased private and institutional purchases, an intensified interest in new painters, larger and more frequent exhibitions of contemporary American art. While the federal government was naturally forced to withdraw from the mural field, part of its work of patronage was taken over by private enterprise. The Springfield Art museum arranged a $4,500 competition for a mural which was won by a soldier, Private Sante Graziani of Camp Robinson, Arkansas. *Life* magazine and the Abbott Laboratories both fostered ambitious essays at reporting the war on canvas. And a new plan, proposed as a model for the establishment of collections of contemporary art in universities throughout the country, was initiated at the University of Arizona, where a donor spent $20,000 for 100 contemporary American paintings.

Besides this increased liveliness in the general scene, the most striking feature of American painting during 1943 was a renewed vitality in the work of many of the established artists. Max Weber, for example, in his 1943 work turned to new fields of colour interest—light warm washes emphasizing the atmospheric glow of his forms and replacing the colder, clearer architecture of his earlier forms. The expressionistic treatment that marked his work during the last few years had pointed in this direction. But the tortured forms of those canvases have taken a calm, restful character in his latest paintings. He has brought them by subtle distortions and this quieter palette into the plane of the picture-surface. Yet no vitality has been sacrificed, in this reduction of three-dimensional emphasis, thanks to increased variety of his tonal modulations. And the sullen mineral colours of his preceding work have now given way to mellower, if still melancholy, gamuts. Another of the older generation, John Marin, in his 1943 oils continued to develop his vigorous technique in marine and Maine coast studies. In this medium he proceeds with always a bolder hand to slash out brush-stroke patterns that add a suggestion of muscular rhythms to the formal and chromatic features of his compositions. At the same time his water-colours have lost none of the idyllic calm of his earlier days though his latest are somewhat less patternistically assertive. Georgia O'Keeffe, a fellow-exhibitor with Marin at Alfred Stieglitz' An American Place in New York, opened 1943 with a large retrospective exhibition at the Art institute in Chicago. And in the canvases she brought back from a summer in New Mexico she evinced a new strength of colour and confidence in an expression based on nature but closely approaching the abstract. "Cliffs Beyond Abiqui, My Backyard" and "Head with Broken Pot—1943" point to an interest in sharply delineated, tightly built compositions in warm earth-colours, deep greens, blacks and ultramarines, that promise a great advance over the softer, seductive, feminine qualities which have so often characterized her work in the past.

Another essential picture-maker, of a very delicate but subtle sensibility, who came emphatically to the fore in 1943 is Milton Avery. Although Avery has never studied abroad, he is perhaps more closely related to the French artist Bonnard in his colour sense and pictorial organization than any other American painter. He had been quietly developing an extremely personal idiom over the last 15 years without any general recognition. But an exhibition of his recent work in the late spring brought him considerable notice, and the oils he produced during the summer offer an even greater freedom of drawing and brushwork than previously and a fresher use of arbitrary colours richly harmonized in an extremely personal way.

Two other younger men with a sensibility to delicate effects, Julian Levi and Yasuo Kuniyoshi, both continued to develop their personal manners. Kuniyoshi's main interest remains the refinements of textural expression, but Levi continued to widen his enterprise in the field of portraiture without abandoning any of his grasp of painterly quality. At the same time the Philadelphian, Franklin Watkins, turned in 1943 almost wholly from his interest in baroque composition to portraiture. In this field Watkins is steadily taking a pre-eminence as the artist who combines perhaps best a psychological sense of the sitter's character with a feeling for the fundamental pictorial effect. But perhaps the most surprising portrait of the year was Charles Sheeler's self-portrait, "Charles Sheeler Looks at Painting," in which he combined certain reminiscences of the forms abstracted from nature of his early work with his more familiar meticulous puritanic, realism in a witty, carefully painted canvas affording a warmth of humanity rare in Sheeler's work of recent years.

Shortly before his sudden death during the summer, Marsden Hartley showed a group of his most recent oils in New York. In these canvases Hartley's personalization of the German expressionistic manner was given an even broader treatment. His rather heavy-handed love of paint was still to the fore—a structural concept above all with little interest in the subtleties of handling. During the year another younger expressionist, Abraham Rattner, showed a marked advance toward a tighter composition without slighting in any way the boldness of his

colour oppositions. Walter Quirt, whose gifts have always been visible through an extremely uneven production, began to show signs of controlling his effects through a more convinced expression. But Karl Zerbe may be said to offer the richest variety of the "expressionists," to which is added a fine colour sense and an enlivening vigour.

In the field of fantasy, Raymond Breinin of Chicago was most successful with his misty dream landscapes, with wraithlike, haunting figures. Julio de Diego found a world idiom somewhat reminiscent of Paul Klee which he managed to personalize through his personal palette. And Morris Kantor's series of war fantasies displayed his characteristic expression on a small scale with considerable quiet poetry.

Of the older abstractionists Stuart Davis was easily the most impressive. The nature reductions of his earlier landscapes and city views have now been further condensed. The resultant abstract compositions have all the decorative charm of his earlier work without the distraction of a representational content which always made itself felt without adding anything to the pictorial effect.

Among the younger painters who were brought forward for the first time in one-man exhibitions, Jackson Pollock of Wyoming is the most individual. He has a rich colour sense and the ability as well as the courage to undertake large compositions. There are still reminiscences of admiration for Picasso in his work. But in approaching a subject, he employs a startling freedom of rhythmic brush-work and through it composes extremely individual abstract compositions. Another younger abstractionist, Irene Rice Pereira, after a long abstention from painting due to illness, showed a group of new work in which her form researches have been given a new direction. In place of her former concentration on textural contrasts of mosaic-like squares parallel to the surface plane, we now see a use of larger elements and an exploration of means for suggesting space within the picture and its architectural composition. Matta Echaurren, the young Chilean surrealist, continued his researches in Redonesque light effects contrasted with tenuous structural elements. While he has not yet found the ability to handle a large canvas satisfactorily, certain passages show an extreme sensibility, and his smaller canvases and water-colours continue to keep him one of the most promising younger men. The Mexican Ruffino Tamayo continued strong, savage fresco-like work without any notable loss or gain in expression. But at the same time Arshile Gorky, whose work has always held a certain promise, buried though it has been in reminiscences of Picasso, Miro and others, seems to have definitely found himself in a series of water-colours painted during the past summer. Here Gorky has finally managed to put his predecessors' work completely out of mind in going direct to nature and has succeeded in transforming his vision of flowers and grass into striking abstract space compositions within a freedom of transcription and meticulous detail that give them a rich individuality.

Among the refugee artists, the most striking production was "Broadway Boogie-Woogie" by Piet Mondrian. In this canvas Mondrian left the static effects of his work of the last 20 years for an organization of restless, contrasting colour squares held together on a stable base of rectangular lines. Marc Chagall likewise seems to have eventually found himself at home in the United States. His work exhibited in 1943 shows him clearly out of the uncertainty which has marked his canvases of the last decade. In an oil such as "The Juggler," although the iconography seems little changed, he has recovered a freshness of outlook and a lively vigour which perhaps represents his response to his new environment better than any representational motives could. Fernand Léger in New York and L. Moholy Nagy in Chicago both continued to find new, if characteristic formal organizations in their individual veins. And of the younger men, Masson and Tanguy produced work in 1943 which began to show signs of recovering the quality of their finest European periods, while George Kepes, in certain camouflage studies produced some of the most interesting researches in pictorial texture-contrasts shown during the year. (*See* also SCULPTURE.) (J. J. SW.)

Paints and Varnishes. United States sales of paint in 1943 were expected to approximate those of 1941. These sales would be 5–10% better than 1942.

Because of the over-all vegetable oil shortage, the oil content of civilian paints was limited by government regulations. Drying oils continued scarce because of the large production of military and civilian coatings and the large domestic and foreign requirements for edible oils and hydrogenated fats, in spite of a 6% increase over 1942 in total 1943 domestic fat and oil production and an all-time record production of 900,000,000 lb. of domestic linseed oil. Linseed oil was burned as fuel in Argentina because of the lack of shipping space.

Castor oil again became of major importance to coating compositions, because of increased shipping from Brazil and increased acreages in Mexico and the United States. Tung oil stocks and their replacement prospects decreased further and forced replacement in many military uses, thereby restricting tung oil to such items as food can coatings, electrical insulating and naval paints.

The gap between the rubber and paint industries was narrowed by large commercial production of elastomers, from drying oils and their acids, to replace rubber in gaskets and other moulded products not requiring high tensile strength.

In general, the use of high grade synthetic resins and solvents was carefully controlled by government regulations. A report of naval stores showed that considerable turpentine was used in 1943 for manufacture of synthetic resin. New and improved resins from petroleum by-products appeared in good commercial quantities. Rosin supplies toward the end of the year were not readily available because of widespread use throughout the war program.

In the field of pigments, ammonium ferrous phosphate was introduced and advocated as a corrosion inhibiting flake pigment because of its impermeability, oxygen and acid acceptance, and competed with red lead and zinc chromate as a component of paints for metal protection. Refined and treated tall oils appeared on the market as a partial replacement for the vegetable oil shortage since tall oil was not classified as a vegetable oil in government regulations.

Containers continued to be a problem in the industry, with the limited use of glass bottles and part fibre containers. Light gauge metal containers, however, were somewhat more available.

Military finishes continued to be a big factor in the industry. The boat-building program in particular affected the supplies of synthetic resins and pigments. This had a pronounced effect on the availability of titanium oxide and zinc chromate pigment for other types of finishes. The lustreless paints used for the majority of military equipment underwent minor refinements and continued in good volume. Considerable reformulation of paints for military needs was necessary to take advantage of available raw material. (A. B. HO.)

Palaeontology. In the United States, Samuel Paul Welles in a monographic study of the long necked

plesiosaurs gave a detailed description of the skeletal anatomy of four new genera, all from the Upper Cretaceous of California. The paper concluded with a revision of the elasmosaurian plesiosaurs that resulted in the naming of five new genera. C. Lewis Gazin published a paper in which the important mammalian faunas of the San Pedro valley, Arizona, were fully discussed. A brief sketch of previous investigations and a discussion of their age and environment was followed by a systematic description of the Benson and Curtis ranch faunas. Two genera and four species were described as new. Lore Rose David in an extended paper described the Miocene fish faunas from many California localities. Part VI dealt with the fish of the famous Lompoc diatomaceous earth deposits. It was found to consist of 31 families, 39 genera and 42 species, a harmonious assemblage of a warm temperate coastal sea. This study revealed there was greater similarity between the fish faunas of the Pacific and Atlantic coasts of America during Miocene time than exists today. A paper by Charles W. Gilmore described all of the known lizard specimens assembled by the Central Asiatic expeditions in their explorations of Inner Mongolia. Seven genera and eight species were named as new. Two of the specimens pertained to North American genera, and a burrowing lizard marks the first occurrence of an Amphisbaenidae in a fossil state outside of the United States.

Charles L. Camp, D. W. Taylor and S. P. Welles issued their *Bibliography of Fossil Vertebrates* covering the years 1934 to 1938 inclusive. This volume of 663 pages of vital importance to all vertebrate palaeontologists, continues a coverage of world literature on vertebrate palaeontology covered previously by a volume published in 1940.

A most interesting discussion relating to the first discovery of fossil vertebrates in North America was published by George G. Simpson. He reached the conclusion that the first discovery of scientific standing was made by Charles Le Moyne, whose party found mastodon remains along the Ohio river in 1739. He points out, however, that the Indians should be credited with the first authentic discovery of "great bones" as early as 1519 in Mexico.

In invertebrate palaeontology in the United States, E. O. Ulrich, Aug. F. Foerste and A. K. Miller published Part II Brevicones of their joint report on the Ozarkian and Canadian cephalopods. This systematic study of all available materials resulted in the discovery of no less than seven genera and 145 new species. The paper is full and well illustrated.

Vladimir J. Okulitch issued a paper on the Pleospongia of North America, in which all of the Cambrian fossil sponges were described and illustrated. Their geographic and stratigraphic distribution, ecology and faunal associations were fully considered. A paper by Philip W. Reinhart dealt with the description, stratigraphic and geographic occurrences and relationships of the molluscan family Acidae as represented on the Pacific slope. Nine genera and 85 species were recognized, more than half of which occur in the recent fauna. A few species were described as new.

In a paper describing stemless crinoids from the Lower Cretaceous of Texas, Raymond E. Peck discovered they developed from a stemmed ancestor and became highly modified for a passive floating existence. Four genera and many species were described as new.

In palaeobotany in the United States, Roland W. Brown published a short paper describing a climbing fern from the Upper Cretaceous of Wyoming, the earliest authentic record from North America. Carroll Lane Fenton in a study of Palaeozoic algae discussed the problems involved in the recognition, preservation and nomenclature of early algae. J. H. Hoskins and A. T. Cross published a monographic study of the cone genus *Bowmanites*. This is a review of the genus and a description of several new species.

In South America, Joaquin Frenguelle published a paper on the Triassic flora of Argentina, in which 10 new plant forms were described.

Palestine.

Palestine lies on the western edge of Asia and is bounded on the west by the Mediterranean, on the southwest by Egypt, on the south by the gulf of 'Aqaba, on the east by Trans-Jordan, on the northeast by Syria and on the north by the Lebanon. Area 10,100 sq.mi.; pop. (est. Dec. 31, 1940) 1,545,000. Chief towns: (pop. est. 1939): Jerusalem (cap. 129,800); Haifa (104,800); Jaffa (77,400); Tel-Aviv (130,300). High Commissioner (1943); Sir H. A. MacMichael; languages: English, Arabic, Hebrew; religions: (1939) Mohammedan 848,933; Jewish 424,373; Christian 114,624.

History.—The fear that war might sweep over Palestine was fading by the beginning of 1943, and the thoughts of both Arabs and Jews were returning to the problem of the country's political future.

The internal security of the country was not seriously troubled in 1943, though four British constables were fatally shot during the first nine months. But the underlying tension between the Arab and Jewish populations was vividly illuminated in August and September, when a military court convicted two British soldiers and two Jewish civilians on charges connected with the theft of military equipment from Allied stores. Some 125,000 rounds of ammunition and 300 rifles had been stolen from camps or depots in Palestine and Egypt, and from the docks at Suez. The defending counsel for the two soldiers, each of whom was sentenced to 15 years' imprisonment, pleaded that they had fallen into the power of a wealthy gun-running organization which was connected with the Jewish agency. These allegations were indignantly denied by the agency, which challenged the defending counsel to substantiate them before an independent court of inquiry. Meanwhile the trial of the two civilians, one of whom was a trade union official, was running its six-weeks' course. On Sept. 27 the court sentenced them to imprisonment for ten and seven years respectively, finding at the same time that the existence of a secret organization dangerous to the peace of the country and detrimental to the war effort had been established. The Zionist leaders continued to protest, and attributed sinister motives to the prosecution. In November there were widespread demonstrations of protest against the action of the police and military in searching a Jewish settlement where arms were believed to have been hidden.

THE BEACH at Tel Aviv, Palestine, in 1943

Zionists came into conflict with the British authorities on another occasion during 1943, on the issue of postwar reconstruction. Sir Douglas Harris was transferred in March to the post of reconstruction commissioner, and the high commissioner subsequently defined his task in terms which emphasized the predominantly agricultural character of the Palestinian economy and envisaged a decline from the wartime level of industrial production. This was interpreted by the Zionist general council as a reaffirmation of the policy laid down in the White Paper of 1939, and it declared that the Jewish community would not co-operate in planning on that foundation.

The support of the majority in organized U.S. Jewry for Zionism was expressed in a resolution carried at the beginning of Sept. 1943 by a representative U.S. Jewish conference. This demanded that the Jewish agency should be given authority to regulate immigration into Palestine and to develop the country's resources, these measures being "the essential prerequisites for the attainment of a Jewish majority and for the re-creation of the Jewish Commonwealth."

Meanwhile the leading statesmen of neighbouring Arab countries were reminding the world of their interest in the future of Palestine. The prime ministers of Egypt and Iraq each visited Palestine shortly before their conversations in Cairo to discuss the possibility of Arab union, and each assured the Arab population that they were watching over its interests.

The more immediate preoccupations of both government and people were much the same as in 1942. First place was still taken by the cost of living, which was shown by the official index to have risen from a figure of 100 on the eve of the war to 215 in January and 248 in June 1943. This resulted in higher costs of industrial production, and a fear that military orders, which had amounted to £P.10,000,000 in 1942, would begin to fall off even before the cessation of hostilities. The government was urged to subsidize the prices of necessities more generously The 1943 estimates already provided £P.1,000,000 for this purpose, in addition to such other emergency expenses as the loans to citrus farmers, cost-of-living allowances and civil defense measures. There were increases of taxation, including the imposition of surtax on incomes of over £P.2,600.

The White Paper had provided for the admission of 75,000 Jewish immigrants before the end of March 1944, after which date further immigration would depend on Arab acquiescence. At the end of Sept. 1943, owing to the difficulty of escaping from Europe and to shortage of transport, only 44,000 of these immigrants had arrived in Palestine. His majesty's government therefore decided to suspend the time limit for the remaining 31,000.

Education.—(1939–40): Arab public system maintained by government, 402 schools (12 with secondary sections), 54,367 scholars; Muslim schools, private 178 (2 with secondary sections) with 14,204 scholars; Jewish public schools (1940) 419 (including 6 training colleges and 18 secondary, 5 trade and vocational schools) with 56,900 scholars; Jewish private schools 320 (including 22 secondary schools and 2 training colleges) with 25,700 scholars; Christian schools 195 with 25,274 scholars; Hebrew university, Jerusalem 130 teachers, 1,106 students.

Banking and Finance.—Revenue and expenditure (1941–42) revenue £P.8,325,553; expenditure (1941–42) £P.7,463,602; public debt (March 31, 1942) £P.4,475,000; notes in circulation (Jan. 31, 1943) £P.24,700,000; exchange rate £P.1 = £1 sterling = $4.03 U.S. in 1943.

Trade and Communication.—Overseas trade (merchandise): (1941) imports £P.12,038,000; exports £P.1,362,000; (1940) imports £P.11,035,454; exports, domestic £P.2,114,584; re-exports £P.176,195. Communications and transport: roads (1939) all weather 1,451 mi.; seasonable 985 mi.; railways (1940) broad gauge 333 mi.; narrow (Hedjaz rly.) 271 mi.; airways (1938): passengers 600, mail 86.9 tons; shipping (1939) entered 1,857 vessels; 4,370,085 net tons. (Dec. 31, 1940) motor vehicles licensed: 5,062 private cars, 1,198 public cars, 936 buses; 3,180 trucks and vans, 1,331 cycles; tractors 20; wireless receiving set licences (1938) 35,708; telephone subscribers (1940), 10,716.

Agriculture and Mineral Production.—Production 1939 (in short tons): potash (exports) £P.381,162; citrus fruits (exports) £P.3,807,570; barley (1940) 113,500; wheat (1940) 149,900; olive oil (1940) 3,970; wine (1938) 792,500 gal.; maize 6,830; tobacco (1940) 1,100; potatoes 11,460; sesamum 4,190.

Palmyra Island: *see* PACIFIC ISLANDS, U.S.

Panamá. A republic of Central America, nearest to South America. It is bisected by the Canal Zone, leased to the United States. Area: 32,933 sq.mi.; pop. (1940 census): 631,637, exclusive of the Canal Zone (pop. 1940 census: 51,827). The capital is Panamá city (111,893); other cities are: Colón (44,393); David (9,222); Chitré (4,790); Santiago (4,253). President in 1943: Dr. Ricardo Adolfo de la Guardia.

History.—The most noteworthy political news from Panamá in 1943 was the decision to suspend the coming presidential election. Under war conditions it was felt that the hazards of chang-

ing administrations would be too great for the safety of the republic, and on Jan. 4 the Panamá national assembly voted to continue President Ricardo Adolfo de la Guardia in office for two more years, without an election being held. A possible threat of revolution was removed late in August when Dr. José Pezet, former minister of education in the administration of President Arnulfo Arias, was arrested, together with others suspected of conspiracy against the government (Pezet claimed that under the Panamá constitution he should have succeeded to the office vacated by Arias but assumed by de la Guardia).

In April the senate of the United States approved a 1942 agreement by which certain water and sewage systems and real estate in the cities of Colón and Panamá were to be turned over to the republic, and a $2,700,000 debt for Panamá's share of a strategic highway project liquidated.

A department of public works was established Aug. 25, to care for the national construction program.

Economic conditions in Panamá were good during the major part of the year. While the export trade continued low, only a small part of the normal volume of bananas and coco-nuts being shipped, import trade was high. The large number of service men at the Canal Zone, and the extensive defense construction there, meant large pay roll expenditure in Panamá, effectively offsetting the loss of peacetime tourist trade. Late in the year employment in the Zone slackened, with purchasing power in the republic declining accordingly.

The agricultural program inaugurated in 1941–42 continued to develop although slowed down by lack of labour, farm and irrigation machinery, and particularly shortage of fuel and tires for essential transportation. Price control remained in effect, and gasoline use was severely restricted. Shortage of meat made necessary the advocation of "meatless Mondays."

Education.—In 1940, Panamá had 550 primary schools (enrolment 55,000); 7 post-primary schools (enrolment 4,500) and a National university with 500 students. Panamá is also the site of a new Inter-American university. Expenditures for education in 1941 were $2,513,000.

Finance.—The monetary unit is the balboa, equal in value to the U.S. dollar. The budget for the biennium ending Dec. 31, 1944, was set at $39,378,714 (revenue for 1942: $22,310,000; expenditure: $21,347,000). Income for the first half of 1943 was $13,037,757. There was no internal debt by 1943; the external debt (July) was $18,337,100.

Trade and Resources.—Exports for 1942 were valued at $2,229,028, a decline of 48% from the previous year. Imports for 1942 were $37,579,517, up 14%.

Panamá has embarked upon a diversified agriculture program which it is hoped will make her independent for basic foodstuffs. In 1942, production of major crops was: rice 1,356,892 quintals; corn 228,654 quin.; beans 63,033 quin.; bananas 685,218 stems; plantains 4,048,000 stems; coco-nuts 455,754 (smallest output since 1910); cacao 2,161 short tons; abacá 254 tons; sugar 8,864 tons. There were 6,691,956 lb. of honey produced.

Communication.—Highway mileage in 1942 was 750 mi.; railway mileage, 257 mi. Communication with the outside world is by sea and air. (*See* also CENTRAL AMERICA; HISPANIC AMERICA AND WORLD WAR II.) (D. RD.)

Pan-American Highway: *see* ROADS AND HIGHWAYS.

Pan American Union.

The Pan American union is an international organization created in 1890 at the First International Conference of American States and maintained by the 21 American republics to promote peace, commerce and friendship among the republics. The union is supported by annual contributions from member countries in amounts proportional to population. It is controlled by a governing board composed of the secretary of state of the United States, who is chairman, and the diplomatic representatives in Washington of the other republics. Headquarters: Washington, D.C.; director general in 1943, Dr. L. S. Rowe; assistant director, Dr. Pedro de Alba.

The Pan American union serves as the permanent secretariat of the International Conferences of American States and organizes many of the technical inter-American conferences convened to consider specific subjects. The union is also a centre of information on the American republics and on inter-American relations.

At the meeting of ministers of foreign affairs of the American republics held at Rio de Janeiro in 1942, the Pan American union was requested to organize several special agencies to deal with problems arising out of the participation of American republics in the war. Among these was the Inter-American Defense board, which continued to function at Washington during 1943, with the participation of military, naval and aviation experts of the 21 republics.

The Emergency Advisory Committee for Political Defense, composed of seven representatives designated by the governments of Argentina, Brazil, Chile, Mexico, the United States, Uruguay and Venezuela, was established in Montevideo to control subversive activities in the American republics. During 1943 the committee made consultative visits to many of the countries of the continent, and worked out with officials of each country a program for the effective application of the committee's recommendations. National committees for political defense were established in all the countries visited.

The Inter-American Financial and Economic Advisory committee, organized in 1939 immediately following the outbreak of the war, continued its activities at the Pan American union during 1943, giving major attention to the resolutions of a financial and economic character adopted at the Rio de Janeiro meeting of foreign ministers. A special subcommittee was set up to map plans for the Inter-American Technical Economic conference, provided for in one of the Rio resolutions, to consider present and postwar economic problems. Through the Inter-American Coffee board, established by the committee in 1941, the plan for the division of the coffee market of the United States among the 14 coffee-producing countries of Latin America on the basis of their proportionate share of total production, was extended for another year to Oct. 1944.

The Executive Committee on Postwar Problems of the governing board of the Pan American union prepared a study of basic principles of the inter-American system, and undertook the preparation of a report on recent trends in inter-American economic co-operation. The preliminary recommendation on postwar organization formulated by the Inter-American Juridical committee of Rio de Janeiro in 1942, was sent to all the governments of the American republics, several of which during 1943 set up national committees to undertake studies and formulate projects on problems of postwar organization.

At the meeting of the governing board of the Pan American union held on Nov. 3, the Hon. Cordell Hull, secretary of state of the United States, was re-elected chairman of the board for the year 1944. The ambassador of Honduras, Dr. Julian R. Cáceres, was elected vice-chairman, succeeding the Bolivian ambassador, Dr. Luis F. Guachalla. (*See* also HISPANIC AMERICA AND WORLD WAR II.) (L. S. RO.)

Paper and Pulp Industry.

In 1943 the paper and pulp industry found itself in the

Table I.—*United States Paper Production Capacity for 1942*

middle of a war economy. With steel, tin, aluminum and other materials diverted almost entirely to armaments many products heretofore made of these materials found paper and paperboard as substitutes. In the packaging of foods alone the requirements of paper products had to meet tremendous demands. On the other hand the industry had to meet large losses through paper curtailment of other industries such as the automobile, refrigerator, radio, etc. whose reduced requirements were reflected in paper and paperboard production In all branches of business great accomplishments were made in reducing paper requirements.

Throughout 1943 the shortage of wood pulp, caused largely by reduced manpower in the woods, made it necessary to allocate pulp to mills on the basis of essential paper production. Many mills increased their re-use of waste paper. Rayon pulp requirements increased from 72,000 tons in 1930 to 316,308 tons in 1942. Nitrocellulose as an outlet was a new and large user of wood pulp, it having previously been made from cotton. Because of steel and other priorities no new mills were built in 1943.

Canada.—In 1941 pulp and paper ranked first with respect to wage and salary distribution, capital investment and net value of production; it was second to the non-ferrous metal smelting and refinery group with respect to gross production and second to sawmills with respect to employment. There were 105 mills in operation in 1942.

United Kingdom.—No statistics were available to show paper production in Great Britain after the war began. Having de-

pended largely on Scandinavian mills for raw materials, considerable adjustment was necessary in operations since only a limited amount of pulp was available from America. Straw and old papers became the major raw materials. There was a critical shortage of rosin and esparto. The government controls eliminated most unessential uses for papers and Great Britain learned how to get along with the quality and quantity of papers produced.

(R. G. M.)

Papua: *see* BRITISH EMPIRE; NEW GUINEA; PACIFIC ISLANDS, BRITISH.

Paraguay. An inland republic in southern South America. Area, 154,165 sq.mi.; pop. (1938 official estimate: 954,848) was unofficially computed at nearly 1,100,000 in 1943. The official language is Spanish, but Guaraní, the indigenous tongue, is more widely spoken outside the capital. The capital is Asunción (pop., 1943 unofficial est., 123,000). Other important cities, with approximate populations, are Villarrica (35,000), Concepción (13,000), and Encarnación (15,000). Religion: overwhelmingly Roman Catholic. President in 1943: Gen. Higínio Morínigo.

History.—In May, Pres. Morínigo visited Brazil, returning an earlier official visit by Pres. Vargas; the following month he made a journey to the United States, visiting most of the other American republics on the same occasion. Commercial treaties with Brazil and Bolivia were made; a similar agreement with the United States was under formal discussion. A trade treaty with Argentina in November was followed the next month by an official visit to that country. Internal development continued to be fostered through United States financial and technical aid to a sanitation and health program, agricultural research, highway improvement and other projects.

Education.—Paraguay has some 2,000 primary schools and a national university (at Asunción). The educational system, however, is not well developed. Illiteracy is officially estimated at about 50%; however, reliable foreign observers put it at 60% or higher.

Finance.—Until 1943, the monetary unit was the peso (value: 302 to the U.S. dollar), divided theoretically into 100 centavos. The lowest coin was the 50-centavo (½ peso) piece, the highest bill 1,000 pesos. Effective Nov. 7, 1943, a new unit was established, the *guarani* (value 33 cents U.S.), equal to 100 of the former pesos. The gold peso (value: 68.66 cents U.S.) was used for foreign transactions.

Trade.—In 1942, exports were 16,539,588 gold pesos, 9.3% over 1941 and 45.3% over 1940 totals; going to Argentina in transit, 44.9% (1941: 42.7%; 1940: 36.4%), Great Britain 18.8% (19.1%; 12.7%), United States 14.7% (19.0%; 20.9%), Argentina 13.6% (13.4%; 22.5%), Uruguay 6.4% (5.3%; 3.2%). Imports were 17,161,673 gold pesos, 41.6% over 1941 and 15.2% over 1940, Argentina supplying 44.8% (1941: 50.5%, 1940: 45.1%), Brazil 24.6% (4.4%; 3.1%), United States 19.4% (19.6%; 21.4%), Great Britain 6.1% (8.5%; 8.6%). Preserved meats made up 22.4% of all 1941 exports (1940: 15.1%), quebracho extract 19.2% (22.2%), hides 12.6% (12.5%), cotton 10.5% (11.0%), woods 6.2% (6.1%), petitgrain oil 4.9% (4.4%), yerba maté 4.7% (12.9%), sugar 3.5% (0.6%), tobacco 2.4% (3.2%). Imports are approximately 20% foodstuffs, practically all the balance manufactures.

Communication.—Both external and internal communications are inadequate. Only air service approaches adequacy. Air transport is maintained by Pan American Airways system to Buenos Aires, Rio de Janeiro, and Corumbá (Brazil), and by an Argentine air line. Weekly Brazilian military-postal planes provide airmail service from Brazil. During 1943, application was made in the United States by Eastern Air Lines for a New York-Buenos Aires service to pass through Asunción. There is no internal air service. The country's main dependence is upon water transport. The chief access to world markets is by an Argentine shipping line by way of the Paraguay and Paraná rivers to Buenos Aires. A Brazilian line maintains services to Montevideo and to Corumbá (Brazil). Small river steamers serve Paraguayan ports on the Alto Paraná and Paraguay rivers.

The principal land communication is by rail from Asunción to Encarnación, where it connects by train-ferry across the Paraná and Posadas, and thence to Buenos Aires. Some short lines exist in the Chaco. Total railway mileage approximates 713 mi.

Highway communication is generally poor except for the Estigarribia Highway from Asunción to Villarrica, which is being extended toward Encarnación through United States financial aid.

Resources.—Cotton, sugar, tobacco, rice, peanuts and corn are extensively cultivated, both for domestic consumption and (except corn) for export. Competition in world markets is hampered, however, by high shipping costs. The same factor adversely affects development of citrus fruits. Petitgrain oil (from bitter orange leaves) is, however, well developed as an export. Some tung oil is produced. Yerba maté is cultivated especially for domestic consumption. Among forestal products quebracho, source of tannin, is extensively exploited for export, as are some miscellaneous valuable cabinet-woods.

Cattle raising is important, with canned meats, meat extracts, and hides important export items. In 1943, Great Britain purchased all canned meat exports for United Nations war needs. Mineral resources are negligible. In 1943, however, extensive surveys were made for petroleum in the Chaco.

Manufacturing.—Manufacturing is but slightly developed except for tannin extraction and meat processing. Some *ñanduti* (Paraguayan lace) is manufactured for export.

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers, an organization of more than 2,500,000 members in about 28,000 local parent-teacher associations, was organized and functioning in 1943 in each of the 48 states, the District of Columbia, Hawaii and Puerto Rico. Founded in 1897 in Washington, D.C., as the National Congress of Mothers, the Congress is dedicated to the care and protection of children and youth. Membership is available to anyone interested. The organization's program includes activities dealing with education in all its phases, health, home and family life, citizenship, juvenile protection, etc. An extensive program of war activities was carried on, based on the regular, long-range program of the Congress.

The organization maintains an extensive publications program. The *National Parent-Teacher,* official magazine, is published ten times a year. *The National Congress Bulletin,* published monthly, goes to every local association and to individual subscribers. *Community Life in a Democracy, Schools for Democracy* and *The Parent-Teacher Organization: Its Origins and Purposes* were important book publications.

Special projects of the Congress included the summer round-up of the children, the community school lunch, the national radio project, and the traffic safety education project. The Congress carried on a constant program of study of legislation affecting children and youth, co-operating with both government and citizen organizations in many phases of the work. The office of the National Congress is at 600 S. Michigan blvd., Chicago 5, Ill. President (1943–46), Mrs. William A. Hastings of Madison, Wis.

(M. A. Hs.)

Paris. Capital and largest city of France, pop. (1936) 2,829,746; of greater Paris, including the belt of suburban factory towns, 4,933,855 There was a mass exodus from Paris at the time of the German occupation on June 14, 1940, but most of the refugees later returned to their homes. During 1943 there was no return of the French government to Paris, perhaps because the Germans regarded that city as likely to be in the advanced zone of hostilities when the Allied invasion of the continent took place.

Paris had suffered no major damage during the war and occasional Allied bombings of the Renault automobile works and other factories working on German war orders had not touched the city's famous architectural monuments and artistic treasures by the end of 1943.

Paris during 1943 continued to be cut off from direct contact with the non-axis world. The German military governor was General Otto von Stulpnaegel, and he repeatedly resorted to shooting of hostages in an effort to curb terrorist attacks on German soldiers and acts of sabotage inspired by the French underground resistance movement. One of the better known victims of these shootings was Gabriel Peri, a writer on foreign affairs for the communist newspaper, *L'Humanité*.

But the underground movement, far from being crushed, gained strength as the tide of war turned against Germany in 1943. With its revolutionary traditions and its large population of students and workers, Paris contributed its full share of volunteers and martyrs to the underground resistance. The German attack on Russia in 1941 had brought a considerable number of workers in the industrial suburbs of Paris into the camp of national resistance.

French industry in Paris and elsewhere was more and more compulsorily integrated into the nazi economy. Germany was obtaining tanks from the Renault plant and shells, grenades, bombs and army cars from the big Citroën automobile works, along with planes from the Potez factory in Amiens. There was also a good deal of pressure to obtain skilled French workers for munitions factories in Germany.

Life for the great majority of Parisians was bleak, cold and hungry under the enemy occupation, although the rationing system prevented downright starvation. French food rations, as of 1942, were as follows:

Bread, 68 oz. a week; meat, 6½–9 oz.; fats and oils, 3½ oz.; potatoes, irregular. Clothing was very scarce and a new pair of shoes could be bought legally only if convincing evidence was presented that the owner had completely worn out any old pairs. A black market where extremely high prices prevailed was patronized by wealthy people. There was a lively speculation in objects of permanent value, paintings, furniture, rare editions of books, stamp collections, antiques of all kind, fine porcelain. This reflected the growing distrust of the paper franc which, at last accounts as of 1943, was quoted at 210 to the dollar on the free market, as against an official value of 43.50 to the dollar.

Motor transportation continued very much diminished in Paris, and the motor vehicles on the curiously quiet streets were mostly German staff cars and army trucks and trucks engaged in municipal services. The Metro (subway) continued to function and was jammed to capacity. A few horse-cabs appeared on the streets.

Places of amusement, the Opera and the Opera Comique, concert-halls, theatres, motion-picture theatres and dance-halls remained open and German officers, "collaborationists" and the French who had retained some of their former wealth furnished a clientele for the famous restaurants, most of which, including Maxim's, the Lido and the Boeuf sur le Toit, continued to function in 1943. (W. H. Ch.)

Parks and Monuments: *see* National Parks and Monuments.

Parliament, Houses of. The eighth session of the 37th parliament of the United Kingdom of Great Britain and Northern Ireland was opened, with the usual wartime simple ceremony and without previous announcement, by the king accompanied by the queen, on Nov. 11, 1942.

Changes in the highest offices of the commons were caused by the resignation in January of Sir Dennis Herbert, chairman of committees, followed on March 4 by the death while still in office of Edward A. Fitzroy, the speaker. Col. Douglas Clifton-Brown, Conservative M.P. for Hexham, for five years deputy chairman of committees, had become chairman on Jan. 20. On March 9, when the house reassembled after five days' interruption of business, he was unanimously elected speaker. By simultaneous steps, Major James Milner, Labour M.P. for S.E. Leeds, became deputy and then chairman of committees. Charles Williams, Conservative M.P. for Torquay, was chosen deputy chairman and the vacancy on the chairmen's panel was filled by Charles G. Ammon, Labour M.P. for Camberwell North.

An important reshuffling of war cabinet offices, but without change in personnel, came about in September through the sudden death of Sir Kingsley Wood As chancellor of the exchequer Sir Kingsley was not in the war cabinet, but Sir John Anderson, who passed from lord presidency of the council to succeed him, was and remained so. Clement Attlee, the deputy premier, took over the lord presidency, with its chairmanship of the cabinet committee on home affairs, but gave up his dominions portfolio to Viscount Cranborne, who as leader in the lords already had special access to the cabinet. The new lord privy seal was Lord Beaverbrook, but his return to the government did not restore his cabinet place. (*See* Cabinet Members.) By other changes Richard Law, promoted in the foreign office to the rank of minister of state, was succeeded as parliamentary secretary by George Hall, transferred from the admiralty and replaced by J. P. L. Thomas. N. A. Beechman became junior lord of the treasury.

Further changes on Nov. 12 enlarged the war cabinet by the inclusion of Lord Woolton, on his appointment as minister of reconstruction. As food minister he was succeeded by Col. J. J. Llewellin, whose post as minister resident for supply in Washington, D.C., was filled by Ben Smith. H. U. Willink, brought from the Conservative back bench to be minister of health followed Ernest Brown who remained in the government as chancellor of the duchy of Lancaster. A. T. Lennox-Boyd became the new under secretary for aircraft production.

On the passing of the bill setting up the new ministry of town and country planning, W. S. Morrison, minister-elect, became a full member of the government. (*See* Government Departments and Bureaus.)

In spite of the political truce two seats were lost to the government at by-elections. West Belfast passed from the Ulster Unionists to J. Beattie of the Irish Labour party, and Eddisbury (Cheshire) won from the National Liberals by J. E. Loverseed, gave the Common Wealth party its second M.P.

Lady Apsley's election for Bristol Central to follow her husband, who was killed on active service, brought the number of women M.P.'s to 14. Two other members, Col. Cazalet and Major Whiteley, were killed with Gen. Sikorski, the Polish premier, in a plane crash at Gibraltar.

No censure motion had to be resisted by the government during the year but strenuous opposition from the Conservatives to the bill which set up wages boards in a reorganized catering

trade delayed that measure in committee till some concessions were made. Women members won a notable victory by securing for women compensation equal to that which men receive as a result of civilian war-injuries. The strongly-expressed will of the house obtained important improvements in widows' and old age pensions.

House of Lords.—On becoming viceroy of India, Sir Archibald Wavell was created a viscount and similar rank which would normally have been bestowed on a retiring speaker was granted to Mrs. Fitzroy on her husband's death. Of the five new barons, Sir Roger Keyes became the fourth admiral of the fleet in the upper house and Sir Hugh Dowding's honour commemorated the air victory won under his command in the battle of Britain. (L. Du.)

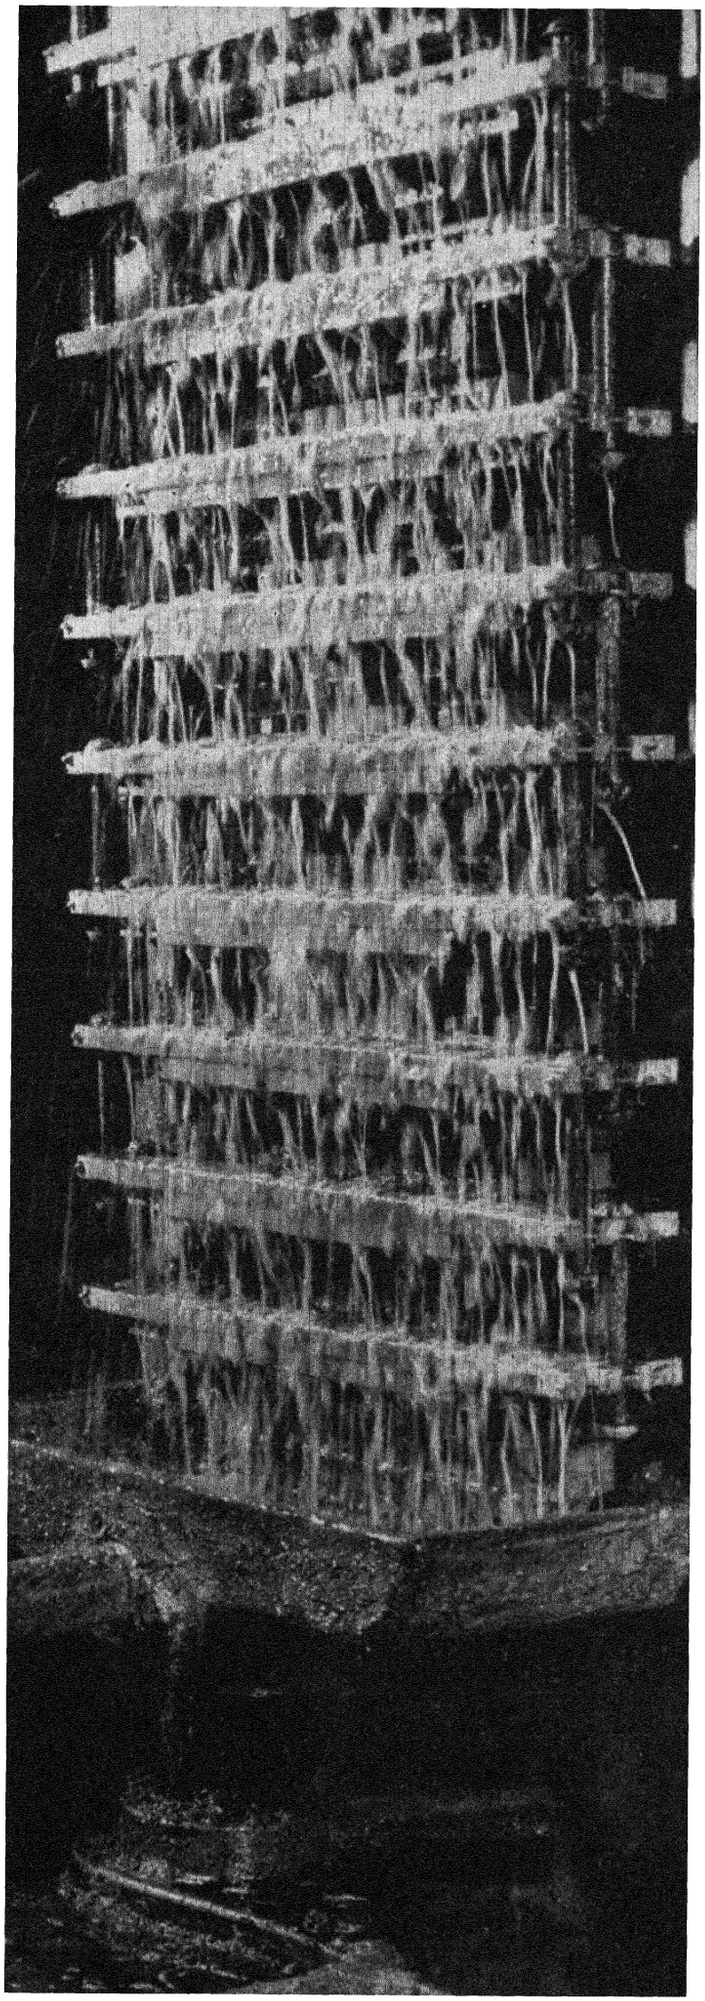
Patch, Alexander McCarrell, Jr. (1889–), U.S. army officer, was born Nov. 23, at Ft. Huachuca, Ariz., the son of an army officer. He was graduated from West Point in 1913 and was commissioned a second lieutenant. During World War I, he saw active duty in France and on his return to the U.S. he became a member of the faculty at Staunton Military academy, Virginia, 1920–24. He attended the Command and General Staff school, 1924–25, and returned to Staunton, where he continued until 1928. In 1930 he received further training at the Army War college. Promoted to the rank of major general in March 1942, Patch commanded the U.S. troops which co-operated with the Free French forces to forestall Japanese seizure of New Caledonia. He was placed in command of operations on Guadalcanal in Jan. 1943, when the army relieved Gen. Alexander A. Vandegrift and his marine units. By Feb. 10 the Japanese had been driven from Guadalcanal, and on March 7 Patch was awarded the navy's D.S.M. with a citation by Secretary of the Navy Frank Knox for his participation in the Guadalcanal action.

Patents. Larger and more significant co-operation with the war and navy departments marked the activities of the patent office in 1943. Of special importance and value were first, its scrutiny of pending applications to determine the military usefulness and the commercial worth of the mechanisms and compositions these covered and secondly, its fulfilment of the provisions of statutes requiring that all such inventions and discoveries be subjected to secrecy to preclude their revelation to the enemy. In 1943 there were issued 4,155 secrecy orders, and from July 1, 1940, to Dec. 31, 1943, a total of 7,875 such restrictions. In this function the commissioner had the collaboration of the war and navy departments, the War Production board, the Office of Scientific Research and Development and other agencies.

In the fiscal year ended June 30, 1943, net receipts of the office were $3,563,616.97, and expenditures $4,610,780.45. There was a decrease in earnings largely attributable to a decline in the number of applications for patents and for trademark registrations. Applications for patents, including those for designs and reissues, totalled 48,724, and for trademark registrations 8,552. Patents granted numbered 33,502. Trademarks registered were 5,596. (*See* also International Law; Law.) (C. P. Co.)

Patterson, Robert Porter (1891–), U.S. government official, was born Feb. 12 in Glens Falls, N.Y. He was graduated from Union college, 1912, took his law degree from Harvard, 1915, and practised law in New York city. He saw military action in the Mexican campaign, 1916, and in World War I, during which he rose to the rank of major and was awarded the D.S.C. Patterson was appointed judge of the U.S. district court for the southern New York district, 1930, and became judge of the U.S. circuit court of appeals, 1939. He resigned his seat on the bench in July 1940 to accept an appointment as assistant secretary of war and five months later became undersecretary of war. In Feb. 1943, Patterson clashed with Rubber Director William M. Jeffers when he charged that Jeffers was furthering the rubber program at the expense of more vital military projects. In November, Patterson defended the construction by the war department of the Canol oil pipeline in northern Canada. While the Truman senate investigating committee revealed that the $134,000,000 project was producing 479 bbl. daily, Patterson insisted that the extremely critical need for oil justified the cost.

Patton, George Smith, Jr. (1885–), U.S. army officer, was born Nov. 11 in San Gabriel, Calif. He was graduated from West Point, 1909, began his army career as cavalry lieutenant, 1913, and was aide-de-camp to General Pershing in Mexico, 1916–17, and in England, 1917. An expert on mechanized warfare, he was made a tank brigade commander in July 1940. On April 4, 1941, he was promoted to major general and two weeks later he was made commander of the 2nd armoured division. Soon after Pearl Harbor, he was made corps commander in charge of both the 1st and 2nd armoured divisions and organized the desert training centre at Indio, Calif. Patton was commanding general of the western task force during the U.S. operations in Africa in Nov. 1942, and handled the landing of U.S. forces on the western coast of Africa.



Named for promotion to lieutenant general on March 11, 1943, Patton fought through the major portion of the Tunisian campaign. On May 8, it was announced that he had been superseded by Gen. Omar N. Bradley. Patton meanwhile organized new forces for the impending invasion of Sicily, during which he commanded the U.S. Seventh army, but did not participate in the Italian campaign in 1943. Patton was widely criticized in Nov. 1943 when it was revealed that he had twice struck an enlisted man suffering from shell shock in an evacuation hospital in Sicily in August. Severely upbraided for this action by Gen. Dwight Eisenhower, Patton apologized not only to the victim of his outburst but to his seventh army troops as well. Eisenhower subsequently defended his retention of Patton in a post of responsibility on grounds that he was a loyal and valuable leader.

"Pay-as-you-earn" System: *see* Taxation.

Peaches. The 1943 peach crop of the United States was estimated by the U.S. department of agriculture to be only 42,060,000 bu. compared to 65,365,000 bu. in 1942, a decline of 37% from 1942 and 24% below the ten-year (1932–41) average. Only seven states, all of them in the western groups, had above-average crops in 1943. Colorado had a record crop and Utah the largest in recent years. The New Jersey crop was below average and the crops of Pennsylvania and Michigan only fair. Most other states had very small crops. Production in the ten southern peach states was 5,378,000 bu. compared to 19,591,000 bu. in 1942 and the ten-year (1932–41) average of 15,108,000 bu.

U.S. Peach Production in Leading States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
California	25,127,000	28,752,000	Texas	900,000	1,610,000
Washington	2,052,000	2,168,000	Arkansas	738,000	2,337,000
Colorado	1,978,000	1,490,000	Alabama	649,000	1,595,000
Georgia	1,593,000	6,177,000	South Carolina	392,000	3,500,000
Michigan	1,452,000	2,150,000	North Carolina	252,000	2,463,000
Pennsylvania	1,176,000	1,771,000	Virginia	172,000	1,936,000
New Jersey	918,000	1,228,000	New York	95,000	1,615,000

In California production of all varieties was less than in 1942 though above the ten-year average. Clingstone production was 16% less than 1942 while freestone production was 7% smaller. Production in all other states was less than 1,000,000 bu. apiece. (J. C. Ms.)

Peanuts. The increase in peanut production needed in the war emergency was met in 1943 by a total crop of 2,561,610,000 lb. as estimated by the U.S. department of agriculture which was about 16% more than the 2,211,535,000 lb. crop of 1942 and about double the ten-year average (1932–41) of 1,214,777,000 lb. In the old commercial areas of the southeastern states yields were near a record. Lower yields were reported from

U.S. Production of Peanuts by States, 1943 and 1942

State	1943 lb.	1942 lb.	State	1943 lb.	1942 lb.
Georgia	910,080,000	627,690,000	Oklahoma	92,750,000	151,050,000
Alabama	499,875,000	335,400,000	South Carolina	46,800,000	28,875,000
Texas	344,705,000	430,080,000	Mississippi	23,750,000	30,000,000
North Carolina	317,100,000	332,100,000	Tennessee	15,750,000	6,750,000
Virginia	103,875,000	175,950,000	Arkansas	12,300,000	15,200,000
Florida	94,500,000	69,600,000	Louisiana	10,125,000	8,810,000

the southwest indicating that the crop had been expanded onto poorer lands less suitable to the crop. In Oklahoma unfavourable weather delayed harvest particularly of late planted peanuts which were damaged by unusually early frosts. While the acreage more than doubled after 1941, a further increase of about 30% was suggested by the War Food administration for 1944 to get the much needed oil. The principal retarding factors were labour and machinery. (J. C. Ms.)

Pears. Production of pears increased to a record crop of 32,000,000 bu. in 1938, but declined to 31,000,000 in 1942 and was estimated by the U.S. department of agriculture at 23,761,000 bu. in 1943. This amount compares with an average crop of 27,938,000 bu. for the period 1932–41. The production of Bartlett pears in California, Washington and Oregon was about the same as in 1942 but 13% larger than the average. In these

U.S. Pear Production in Leading States, 1943, 1942 and 10-Yr. Average

(In thousands of bushels)

State	1943	1942	10-yr. average	State	1943	1942	10-yr. average
California				New York	528	1,241	1,192
Bartlett	11,209	8,834	8,413	Michigan	481	1,000	1,156
Other varieties	1,250	917	1,250	Texas	211	508	361
Washington				Georgia	138	507	323
Bartlett	3,906	5,063	4,158	Mississippi	136	519	322
Other varieties	1,360	1,612	1,848	Virginia	26	528	336
Oregon							
Bartlett	1,449	1,824	1,431				
Other varieties	1,462	2,504	2,157				

same leading pear producing states other varieties than Bartlett yielded about 21% below the average. The crop in the rest of the states was much below average. Prices were about 50% higher in 1943 than in 1942.

All other states produced less than 500,000 bu. each in 1942 and less in 1943. (J. C. Ms.)

Peat. Lack of imported supplies stimulated peat production in the United States to an increase from 70,097 short tons in 1940 to 86,503 tons in 1941, but in 1942 output dropped back to 71,500 tons. About 75% of the supply is used as a soil conditioner, 20% in mixed fertilizers, and 5% in other uses, including litter in barns and poultry yards, and packing material for fruits, vegetables and shrubs, so that practically the entire supply

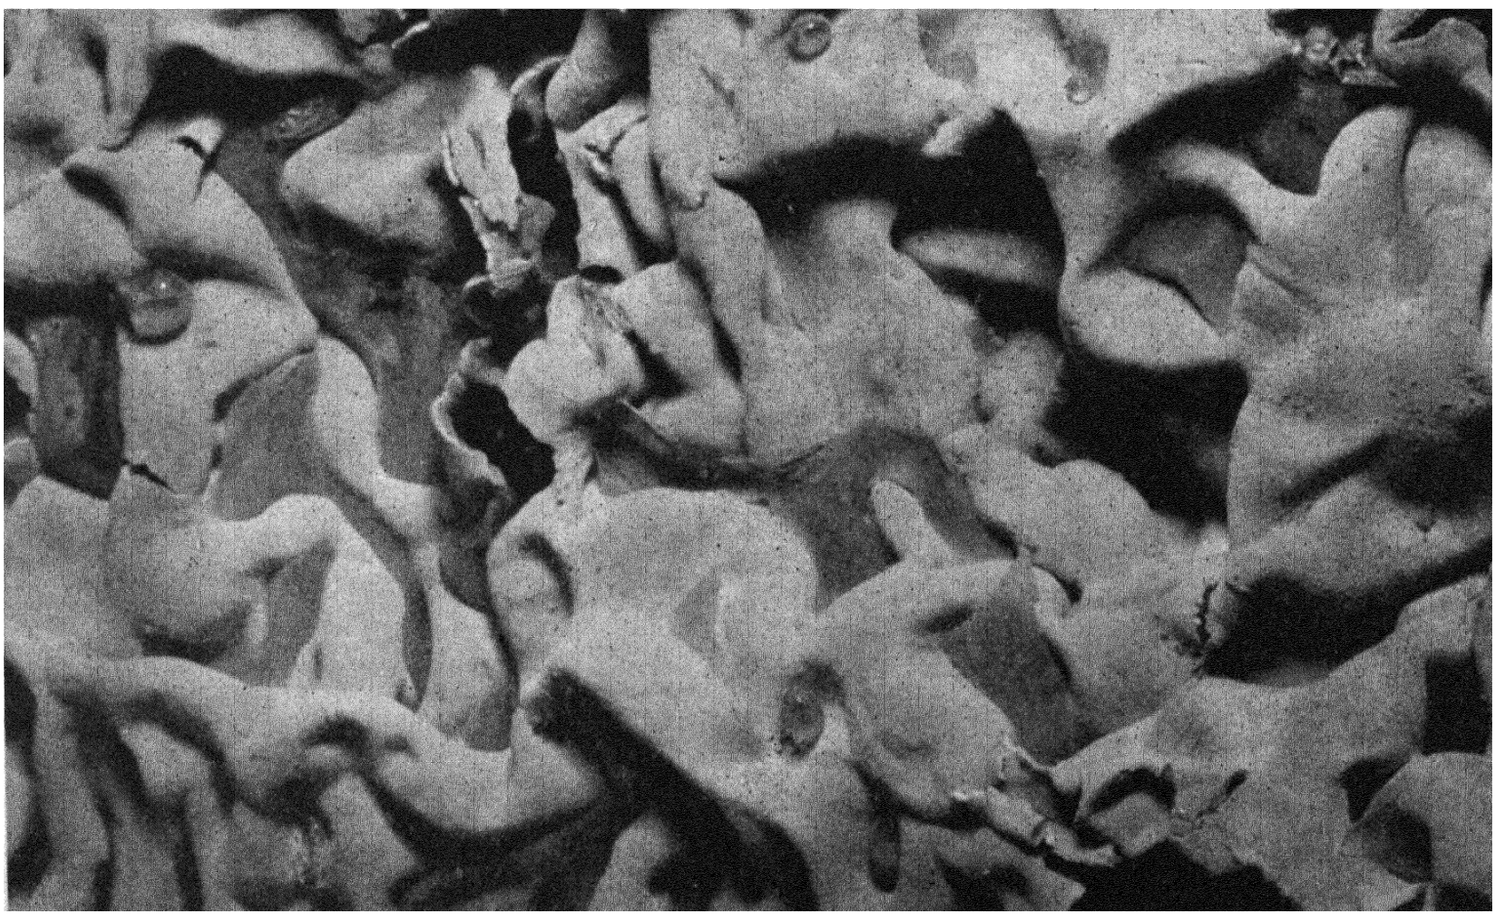
PEANUT OIL pouring from a hydraulic press in Terrell county, Ga. A source of glycerine for munitions, production of the oil was speeded up in 1943

is used in agriculture, and none as fuel, which is the main use in the important European producing countries. (G. A. Ro.)

Pecans: *see* NUTS.

Peek, George Nelson (1873–1943), U.S. industrialist and government official, was born Nov. 19 in Polo, Ill. After graduating from the Oregon (Ill.) high school in 1891 he attended Northwestern university. He entered private industry in 1893, soon became an executive and served in that capacity with several agricultural implement companies until 1923. In 1918 he was with the War Industries board as commissioner of finished products. The following year he acted as chairman of the industrial board in the U.S. department of commerce. As president of the American council of Agriculture, 1925–28, Peek gained a knowledge of farm problems which proved valuable when he was appointed administrator for the newly formed Agricultural Adjustment administration in May 1933. In 1934–35 he acted as special adviser on foreign trade to President Roosevelt while serving as head of the Export-Import Bank of Washington. He was the author of several articles and pamphlets dealing with national agricultural policy and foreign trade. He died at Rancho Santa Fe, near San Diego, Calif., on Dec. 17.

Pellegrinetti, Ermenegildo (1876–1943), Italian cardinal, was born March 27 at Camaiore, Italy. He entered a seminary at Lucca and had served in an inconspicuous capacity until 1919 when he accompanied the late Msgr. Achille Ratti, Papal Nuncio, to Warsaw as secretary. When the latter became pope in 1922, he selected Pellegrinetti to represent the Vatican as Nuncio to Yugoslavia. In his new post, Pellegrinetti found himself surrounded with anti-Italian and anti-Vatican sentiment. Although ratification of a concordat which he negotiated in 1936 was deferred by the Yugoslav senate, his work, nevertheless, was said to have improved the status of the Roman Catholic Church in that country. He was made titular archbishop of Adana in 1922, a cardinal in 1937, and was mentioned as possible successor to Pope Pius XI. Cardinal Pellegrinetti died in Rome, March 29, according to a Rome broadcast recorded in London.



Pemba: *see* BRITISH EAST AFRICA.

Penicillin. Penicillin is an extremely powerful germ-killing substance. It is obtained by growing a mould known as *Penicillium notatum* in a suitable liquid medium and then extracting the active substance from the liquid. It is such a potent agent that in dilutions of 1 part in 100,000,000, the growth of such death-dealing organisms as the staphylococcus is prevented.

Penicillin was first described by Dr. Alexander Fleming in 1929. For ten years it received little attention. It was difficult to produce and it was extremely unstable. From 1940 on, however, there was great interest in this agent, since it is an effective weapon against a wide variety of infections common among wounded soldiers. Its production and investigation in the United States and in England were a part of the war effort. In the United States, the production of penicillin and its clinical application was stimulated by the Committee on Medical Research of the Office of Scientific Research and Development.

Penicillin is relatively nontoxic. It can be injected into the veins, the muscles, or the subcutaneous tissues without causing any undesirable reactions. It cannot be given by mouth since it is destroyed by the gastric juice. It is excreted rapidly in the urine and in the bile. In view of its rapid excretion it is necessary to give it either continuously or at frequent intervals.

PENICILLIN-PRODUCING MOULD (*Penicillium notatum*) growing on the

The beneficial effects of penicillin in the treatment of many infections can no longer be doubted. A large number of patients were treated and the results were recorded.

In the treatment of blood stream infections, bone infections, lung infections, eye infections, gonorrhoea and syphilis the results were dramatic in many cases. In the case of staphylococcic blood stream infections the fatality rate before the sulfonamides was between 80% and 85% With the sulfonamides it dropped to between 65% and 70%. With penicillin there were good reasons for believing that the death rate would be in the neighbourhood of 20% or 25%.

Infections due to the organism causing gonorrhoea were overcome in 24 to 48 hours even after they had resisted the sulfonamides.

Unfortunately, penicillin alone was ineffective in the treatment of bacterial endocarditis, an infection of the valves of the heart.

The limiting factor in the use of penicillin was its production on a large scale. Prodigious efforts were made to increase production, and progress was made and continued in 1943. Large quantities of the mould must be grown either in bottles or vats for a number of days. Then the active material must be extracted from the medium and purified so that it can be injected in man without causing reactions. Relatively small amounts of penicillin were obtained from large amounts of liquid, so that it frequently required the processing of 250 gal. of liquid to obtain enough material to treat a single patient. Another disadvantage was the instability of the product once it was obtained. All of the processes of manufacture were improved and the facilities for producing larger amounts were being enlarged (*See* also CHEMOTHERAPY.)

Pennsylvania. A Middle Atlantic state and one of the original 13 states of the union, popularly known as the "Keystone state." Area, 45,333 sq.mi. including 288 sq.mi. of water; pop. (1940) 9,900,180, of whom 8,453,729 were native born white, 973,260 foreign born white and 470,172 Negroes. The Negro population increased after World War II began because of the influx of workers from the south attracted by the high wages in the war industries. The white population in 1940 included 80,111 of German birth and 197,281 of Italian. The urban population numbered 6,586,877 and the rural 3,313,303. Capital, Harrisburg (83,893). Cities with a larger population: Philadelphia (1,931,334); Pittsburgh (671,659); Scranton (140,404); Erie (116,955); Reading (110,568); Allentown (96,904); Wilkes-Barre (86,236).

History.—The legislature, which began its biennial session Jan. 5, 1943, continued in session until May 9, passing many important bills. It reduced taxation by $45,000,000 in spite of increased appropriations for welfare and education and appropriations to the police pension fund in Philadelphia and other cities. It suspended the operation of the civil service regulations in state departments for the duration of the war, transferred 400 jobs from the Democratic-controlled attorney general's office to the Republican secretary of revenue, permitted the employment of school children 14 years old on farms in case of a shortage of adult labour, authorized the state council of defense to aid in the elimination of black markets, made an estimated reduction of $3,000,000 in automobile license fees, empowered the governor, with the approval of a legislative committee, to suspend state laws when the legislature is not in session on the request of the federal government, created a postwar planning commission to plan a public works program to provide work for returning soldiers, and increased from 44 to 48 hours a week the permissible time for the employment of women and children in war industries.

The principal officers in 1943 were: Edward Martin, governor; James H. Duff, attorney general; G. Harold Wagner, treasurer, and George W Maxey, chief justice.

Education.—According to the latest figures available in 1943 there was an enrolment of 1,879,736 pupils in the public schools, including 96,824 in the kindergartens, 1,106,275 in the elementary and 676,637 in the secondary schools, with 87,045 teachers in the elementary schools and 22,562 in the secondary. Approximately $200,000,000 was spent for the support of the system.

Public Welfare, Charities, Correction.—An appropriation of $121,024,400 was made for public assistance for 1941–2. This was used to provide relief for 309,000 WPA workers and 102,178 aged and for pensions for 10,686 blind persons. The state maintains seven penal and correctional institutions, for the support of which a biennial appropriation of $247,347.59 was made in 1940–41.

Communications.—Of the approximately 100,000 mi. of highways in 1943, 40,510 mi. were under the control of the state. Of the latter mileage, 32,947 were improved, including 675 mi. in cities, 2,100 in boroughs and 37,782 in townships. Included in the total were 5,700 mi of city streets. The department of highways spent $121,355,846 during the biennium 1941–43. There were 11,950.4 mi. of steam and 1,866.7 mi. of electric railroads in 1943.

Banking and Finance.—There were 399 state banking institutions including 8 savings banks in 1943, with total resources of $3,391,186,556 and deposits of $2,686,191,018. In addition there were 1,313 building and loan associations with assets of $77,670,929. There were 688 national banks with assets of $3,758,013,000, demand deposits of $1,369,985,000 and time deposits of $1,068,266,000. Appropriations for the biennium ending June 30, 1943, were $331,147,595, including $198,000,000 for public relief. The estimated receipts from taxation were $414,141,822. The gross debt was $108,426,000, which securities in the sinking fund reduced to a net of $76,740,932.29.

Agriculture.—The total farm income for 1942 was $362,504,000, in which is included $6,240,000 received from the federal government. The leading agricultural products for 1942 and the estimated crops for 1943 were as shown in Table I.

Table I.—*Leading Agricultural Products of Pennsylvania, 1943 and 1942*

Crop	1943	1942
Wheat, bu.	13,843,000	15,301,000
Corn, bu.	52,026,000	55,685,000
Oats, bu.	16,820,000	36,010,000
Barley, bu.	2,028,000	4,000,000
Buckwheat, bu.	2,443,000	2,145,000
Hay, tons	2,765,000	3,300,000

Manufacturing.—There were 17,366 manufacturing establishments in the state, according to the census of 1940, employing 1,419,041 persons to whom $1,940,045,800 was paid in wages. The capital invested was $4,223,471,300 and the value of the goods produced was $6,991,966,000. The value of the product of the principal industries for 1940 and 1927 is shown in Table II

Table II.—*Principal Industries of Pennsylvania, 1940 and 1937*

Industry	Value of Products	
	1940	1937
Metals	$1,944,848,400	$1,958,279,000
Textiles	795,457,200	819,402,500
Food	740,901,600	770,319,300
Chemicals	518,062,300	400,395,500
Paper and printing	372,074,400	350,430,000
Leather	174,963,900	175,288,000
Tobacco products	92,272,300	85,513,300

Mineral Production.—The latest available figures put the total value of the mineral production at $1,822,389,500. The value of the principal products in 1938 and 1939 was:

Table III.—*Principal Mineral Products of Pennsylvania, 1939 and 1938*

Mineral Products	Value	
	1939	1938
Bituminous coal	$188,900,000	$160,965,000
Anthracite	187,175,000	180,600,167
Pig iron	186,392,533	191,266,844
Petroleum	36,200,000	32,762,000
Natural gas	35,268,000	29,544,000
Cement	34,332,640	28,242,913

The department of the interior reported that the value of anthracite mined in 1940 was $192,539,600 and of bituminous coal was $218,504,200. There are more than 80,000 oil wells from the yield of which 2,095,350,858 gal. of gas were distilled.

(G. W. Do.)

Pennsylvania, University of. An institution of higher learning at Philadelphia, Pa. Carrying on the policy begun in 1941, when the entire faculties and facilities of the university were placed at the government's disposal, the university continued research projects, and additional ones were initiated in chemistry, engineering, physics, medicine, psychology and surgery. Most of these projects dealt with war problems. Some 15,000 war workers in nearby factories had taken advantage of the training programs supervised by the engineering departments and the Wharton school.

More than 300 members of the faculty had entered the government service, the majority having been called to fill positions of administration or research in Washington or elsewhere. Established on the campus were units of the Army Specialized Training program, the Women's Army corps, the Navy College Training program and the Naval Flight Preparatory school. Area-language groups were in training at the University museum, army medical officers at the Graduate School of Medicine and Cadet corps nurses at the University hospital. For statistics of enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (T. S. G.)

Performing Right Societies. Performing right societies exist in the principal countries of the world. They are founded on the principle of copyright law that the right to control public performance is vested in the owner of music copyright. The chief performing right society in the United States and sole affiliate in the United States of the principal foreign societies is the AMERICAN SOCIETY OF COMPOSERS, AUTHORS AND PUBLISHERS, familiarly known under its alphabetical designation of ASCAP. In its 30th year in 1943, ASCAP had become the world's most important performing right society, with 1,600 writer members (including 135 women) and 200 publisher members.

ASCAP's entry into the serious music field, its preparation for postwar licensing of music in industry, and its initiation of litigation to bring the great juke-box field within scope of its licensing activities were important developments of 1943. It announced that during the year it had achieved complete coverage of the commercial musical performance field in the United States, and had put into operation an equalized rate policy that had greatly improved its customer relations. Infringement suits had dropped from a former total of several hundreds to less than 40 at the end of the year.

Heretofore ASCAP had exercised only the popular music rights of its members, covering chiefly songs and dance music. Inclusion of serious music in its repertoire carried a similar enlargement of repertoires of its foreign affiliates, including many familiar old world copyrights widely used in symphonic and concert programs.

Rapid development of the use of music in industrial plants had been world-wide for several years. During 1943 the Performing Right society of England litigated this matter, winning favourable decisions in the highest court in two test cases, with the result that the government itself was to pay a lump sum (£25,000 annually) to PRS for unrestricted use of its repertoire in war plants. In the United States, ASCAP adopted a hands-off policy as a contribution to the war effort, merely asserting its rights and waiving collection of fees for the duration of the war.

Two test suits brought by ASCAP against juke-box operators had not progressed beyond the pleading stage. ASCAP's claim was that the specific exemption of coin-operated machines in the 1909 copyright law was not applicable to juke-box operations.

Because of the war, much of ASCAP's international business was done through the U.S. alien property custodian. England's society (PRS) was the only European organization to continue direct exchange of collections. Other international operations were chiefly of a bookkeeping nature.

Wartime restrictions and accompanying transportation difficulties closed many establishments formerly using ASCAP licenses, but expanding musical policies in those that continued to operate and better coverage combined to keep the total number of licenses up to more than 30,000 and to maintain better than 1942 income.

ASCAP's main office is at 30 Rockefeller Plaza, New York city. There were 22 branches in 1943. Deems Taylor was president in 1943 and John G. Paine general manager.

Perkins, Milo Randolph (1900–), U.S. government official, was born Jan. 28 in Milwaukee, Wis. A salesman and part owner of a burlap bag business, Perkins became assistant secretary in the department of agriculture in the early days of the New Deal, and by 1935 was Secretary Henry Wallace's right-hand man. Named assistant director of the Farm Security administration in 1937, he handled the rehabilitation loan program and cut the cost of government housing for farmers. In Jan. 1939 he was transferred to the Agricultural Adjustment administration as associate administrator and was also named president of the Federal Surplus Commodities corporation. In 1941 he was appointed executive head of the Economic Defense board, retaining that post when this agency was reorganized as the Board of Economic Warfare on Dec. 17, 1941. In April 1942 he was given control of the government program to acquire critical war materials.

In July 1943, a bitter open dispute developed between Perkins' chief, Wallace, and Secretary of Commerce Jesse H. Jones. In Wallace's absence from Washington, Perkins joined in the fray, denouncing Jones.

President Roosevelt ended the quarrel by wiping out the Board of Economic Warfare.

Persia: *see* IRAN.

Peru. A republic on the west coast of South America between Ecuador and Chile, and contiguous also with Colombia, Brazil and Bolivia. Area: 482,133 sq.mi. Pop. (1940 census): 7,023,111; whites and mestizos form 52.89% of the population, Indians 45.86%. Capital city: Lima (533,645); other cities are: Callao (84,438); Arequipa (79,185); Cuzco (45,158); Trujillo (38,961); Iquitos (34,231); Chiclayo (32,646); Huancayo (28,679); Cerro de Pasco (19,187). President in 1943: Manuel Prado y Ugarteche.

History.—During 1943 Peruvian problems continued to be largely internal. Lack of shipping and priorities limited imports, and in April and June food shortages, partly caused by a poor rice crop the previous year, caused some unrest. It was necessary for the government to take over all supplies of rice and beans, and to fix prices on these staples. On Aug. 27 a central price control board was established in an attempt to hold down rapidly rising prices as much as possible.

The government likewise attempted to direct agricultural effort away from production of cotton and sugar and toward diversified food crops. On May 19 a co-operative agreement was signed with the United States designed to increase this latter type of production, with the United States to furnish technical aid. A herd of zebu, which had been purchased in Brazil to be crossed with native cattle, arrived in Peru in July.

An important industrial project got under way during 1943 in the formation of the government-directed Santa corporation, with a $15,500,000 capitalization. It was hoped that the concern could develop Peru's untouched iron ore deposits and accessory transportation facilities to such an extent that the republic would be independent in iron and steel needs.

With axis property taken over by the government, many enterprises were being purchased by Peruvian capital. The Japanese population (estimated at 25,000–30,000) caused some concern because of their key position in some fields of production, and their actions were rigidly limited.

On May 10 a fire, possibly intentional, caused the destruction of the National Library of Peru, with the loss of many priceless manuscripts. A drive was subsequently started to try to restore the collection by gift insofar as this was possible.

Education.—While by law primary education is free and compulsory, in some sections schools are not available. In 1939 there were 4,727 elementary schools with an enrollment of 492,989; about 216 secondary schools and 5 universities.

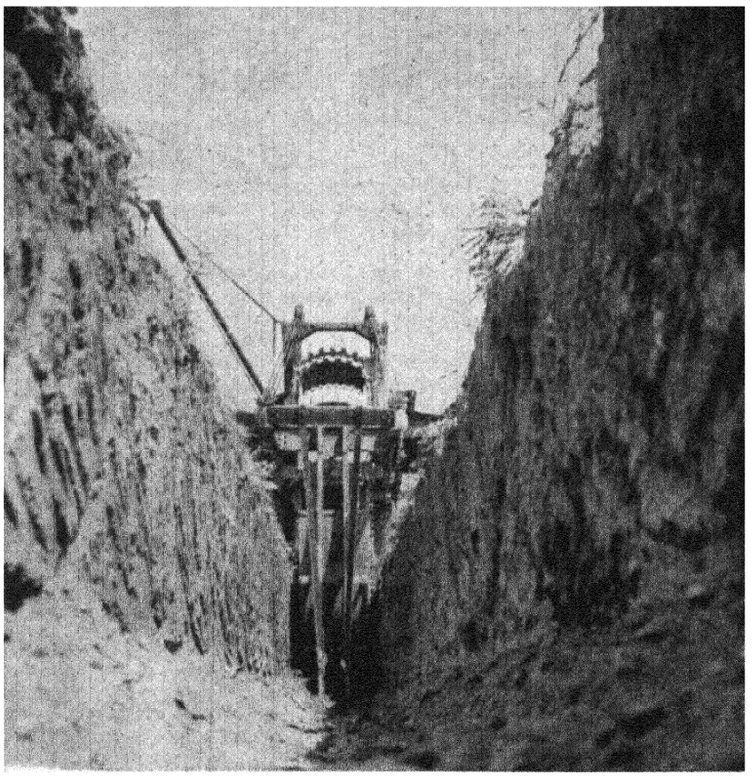
Finance.—The monetary unit is the sol, valued at 15.38 cents U.S. in 1943. Total reserves in the Central bank amounted to 138,000,000 sols on June 30, 1943. The foreign debt (June 30, 1941) 546,078,000 sols; the total internal debt: 379,739,000 sols.

Trade and Communication.—No 1943 figures on total trade were available; 1940 imports were valued at $51,668,000; exports at $65,782,000. At this time the United States supplied 53% of imports, and took 43% of exports; Great Britain supplied 9%, and took 12%. In 1943 trade with neighbouring American states increased.

Communication by sea and air in normal times is excellent, and there is a rail connection to Bolivia. There are some 1,900 mi. of railways. The highway system amounts to 15,700 mi. of good roads. In 1943 the 522 mi. highway connecting the Pacific coast with Iquitos on the Amazon side of the Andes was opened Sept. 7; other trans-Andean links are planned. Possibly 22,000 mi. of Peruvian rivers in the Amazon valley are navigable.

Agriculture.—Cotton, sugar and rice are the leading agricultural crops, with coffee, maize, wheat, cocoa, tea, quinine, flax and tagua nuts also of significance. The cotton crop for 1943 was estimated as less than in 1942 because of insect damage (1943: 56,000 short tons; 1942: 77,000 short tons). Other crop estimates were: sugar, 474,000 short tons; rice, 83,000–94,000 short tons (in 1942, a bad year, 71,650 short tons were produced); flax, 3,968 short tons; dry tea, 250,000 lb. The coffee quota for the year starting Oct., 1943, was set at 30 short tons.

Estimates on wool production for 1943 were: sheep wool, 7,900 tons; alpaca hair, 3,500 tons; llama, huarizo and vicuña hair, 350 tons. For 6 months of 1943, hide and skin output was: cattle, 90,000; sheepskins, 530,000; goatskins, 235,000.



Minerals.—Petroleum production for three quarters of 1943 was 11,505,557 bbl. (total output for 1942: 14,632,530 bbl.). Coal output (1942) amounted to 132,276 short tons. Other minerals (1941) were: copper, 40,589 short tons; silver, 15,100 troy oz.; gold, 260,980 troy oz.; lead (all forms) 69,079 short tons; zinc 29,597 short tons; vanadium, 1,949 short tons; bismuth, 362 short tons. Guano production (1943) was 67,243 short tons, 10% under 1942 output. (*See* also HISPANIC AMERICA AND WORLD WAR II.)

(D. RD.)

Pétain, Henri Philippe (1856–), French soldier and statesman. See *Encyclopædia Britannica* for his biography. He was called from virtual retirement in 1939 to become French ambassador to Spain after Franco's triumph in the civil war and remained in this post after the beginning of war in 1939 until May 18, 1940, when, with France's army falling back in a retreat approaching a rout, he was summoned to Paris to act as vice-president of the government council and adviser to the minister of war. On June 16, 1940, he succeeded Paul Reynaud as premier, and the next day he was forced to sue for peace. He then began the painful task of reconstruction under the watchful eye of France's conquerors. Moving his government to Vichy July 2, he secured from the national assembly authorization to prepare a new constitution. On July 10, 1940, Pétain assumed dictatorial powers.

In 1941, Pétain apparently followed a two-way policy in which he alternately submitted to Germany, then resisted German demands for the French fleet and for French bases in North Africa. But on critical issues, where the Germans raised the iron fist and made peremptory demands, Pétain offered little or no opposition. His failure in 1942 to prevent the Germans from seizing masses of Frenchmen for deportation to German factories did not add to his waning popularity. The aging marshal bitterly protested the Allied occupation of French North Africa on Nov. 8, 1942, and severed diplomatic ties with Washington. By the same token, he protested the total occupation of France by German troops three days later as a breach of the armistice terms. On Nov. 18, 1942, Pétain granted dictatorial powers to Pierre Laval to make all laws and decrees. During 1943, Pétain was no longer in the foreground of Vichy politics. While he denounced the United States for "unjustifiable" bombings of French soil in April 1943, the majority of his countrymen welcomed the attacks as harbingers of the invasion to come. In May 1943, he admitted that "open opposition" to his policies had slowed the "reconstruction" of France and in Nov. 1943, Swiss dispatches said the marshal had been on the verge of resigning as chief of state because the German authorities had prevented him from promulgating a new "democratic" constitution. It was also reported that Pétain had wanted to renounce Laval as his successor.

Petroleum. The year 1943 saw Russia successfully defend the Caucasian oil fields against the invading nazis and wrest Maikop, an important but minor Russian oil

Ditch for the "Big Inch" petroleum pipe line, linking Longview, Tex., and the eastern states. It was completed in 1943

field, from German hands. By the end of the year soviet armies were pressing axis forces toward the Polish and Rumanian borders, thus putting the oil fields of those countries, which were the only large sources of natural petroleum within the home and conquered territories of Germany, within striking distance of air forces—and even of ground forces should the Russian offensive continue to roll on.

Of no less strategic importance was the successful Allied campaign in North Africa and Sicily, which cleared the Mediterranean and shortened the supply lines of the Allied armies. Coupled with the successes attained against German submarines in the Atlantic, these campaign results meant virtually uninterrupted flow, with very little loss, of oil to the armies and navies of the United Nations and for the war industries of Britain. The Russian and African successes also took off threat of invasion and removed the partial blockade existing against the Iraq and Iranian oil fields, giving the United Nations a chance to draw more heavily upon these sources.

The accompanying table shows the world production of petroleum and of petroleum substitutes, 1941 and 1942, divided as to production sources available to Allied nations and to axis nations.

The United States was producing oil at an all-time high of 4,600,000 bbl. a day, but even with that huge rate of production the demand was so great that stocks of both crude oil and petroleum products above ground gradually went down until they reached the minimum for safe working stocks. Actual oil shortage was feared.

It was estimated that in the United States proved oil reserves total 20,000,000,000 bbl. Normally new sources of proved reserves must be found continuously in order to take the place of fields that were being depleted and whose rates of daily production were declining. The major burden of supplying the great current market demand fell on new fields, and—this was what concerned the government's Petroleum Administration for War and the oil industry—the rate of new discovery and the bringing in of new fields was not equal to the drain on existing fields since 1940. It was estimated that 1,500,000,000 bbl. would be produced from reserves in 1943.

Foreign Operations.—One result of this situation was the projected expansion of American activities in oil fields outside the United States. The U.S. army made commitments of $130,000,000 on what was known as the Canol project in northern Canada where the drilling of a number of wells in the Fort Norman district and the building of a pipe line over the mountains to Whitehorse were undertaken as a means of supplying oil for motor vehicles moving over the Alaska highway and for possible use in military operations based on Alaska.

The most significant move, however, was that based upon the operations of the Petroleum Reserves corporation. As pointed out by Petroleum Administrator for War Harold L. Ickes, in the past American oil companies established themselves in the foreign oil business, obtained rights to oil reserves, constructed refining and pipe line facilities, and engaged in world-wide distribution of oil and its products—all entirely as a result of private initiative with the government simply extending its good offices. On the other hand, the other principal nations, or most of them, conducted their foreign oil business through corporations or agencies entirely or partly owned or in effect controlled by the government itself.

Believing that government assistance and participation might be necessary for American companies, the Petroleum Reserves corporation was available for these purposes. The directors of the corporation were the secretaries of state, war, navy and interior, and the administrator of the Foreign Economic administration. That the greater utilization of oil from the near and middle east, including the expansion of production and the provision of additional refining facilities in that area, would be among the first results of this government-sponsored activity was forecast. E. L. De Golyer, former assistant deputy petroleum administrator, and W. E. Wrather, director of the U.S. Geological Survey, both noted petroleum geologists, were sent on a mission to the near and middle east in the fall of 1943.

World Production of Crude Petroleum and Its Substitutes

*Estimated.

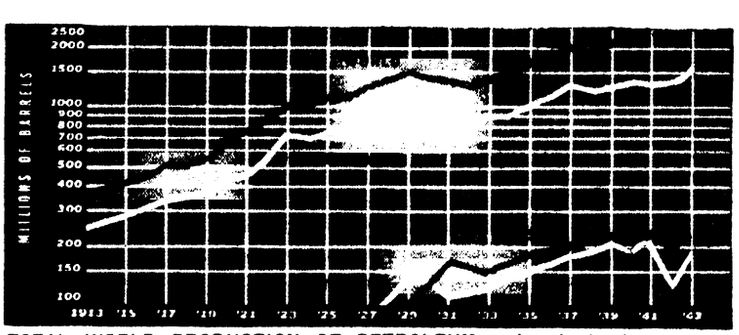
Data taken from *AIME Transactions*, vol. 151, entitled "Petroleum Development and Technology, 1943," page 262.

World-Wide Programming.—Deputy Petroleum Administrator Ralph K. Davies at the Nov. 1943 meeting of the American Petroleum institute, referred to the "necessity for world-wide programming in the effort to make ends meet in the matter of oil supply." Oil demand estimates were made for at least two years ahead from various sources, with the Army and Navy Petroleum board estimating military requirements. The PAW program division had the assistance of the British through the British counterpart of PAW. The war demands were met from sources nearest the area of consumption. Obviously, with limited shipping facilities, the short haul principle was desirable. But shipping could not always be the determining factor as frequently there were other equally real physical limitations such as the quality and quantity of particular products which could be refined at a given point.

War Demand for Petroleum Products.—In 1942 only 12.5% of the total gasoline made in American refineries east of the Rocky mountains went to the military. In the first quarter of 1943, the military took 21.4%; in the second quarter, 23.1%, and the percentage for the last half of 1943 was estimated by PAW at 30.6.

These figures held no promise for civilian consumers in the United States of more liberal gasoline rationing. As more war products were needed out of a barrel of crude oil, less gasoline for motor cars was being made. Each U.S. barrel of crude oil contains 42 gal. The proportions of different products made from it were changed to meet new wartime needs.

Automobile gasoline production was reduced from 18 gal. out of each barrel to 12 gal Of the 6 gal. making up the difference that went into motor car fuel in peacetime, 3½ gal. in 1943 went into aeroplane fuel, synthetic rubber, explosives and special army gasoline.



Two of the 6 gal. went into additional fuel oils needed by the navy, Liberty ships, war factories and the like. Even a part of the production of 12 gal. per barrel of ordinary gasoline was used by the army's vast fleet of trucks, jeeps and other mechanized equipment.

The remainder had to be divided largely among farm tractors, school buses, industrial trucks and essential passenger car use by war workers.

Refineries Converted for War.—Wartime conditions caused great change in petroleum refining. Quantities and quality of super-aviation fuel by American refineries reached high records which must remain a military secret.

In Jan. 1942, there were 22 refineries in the United States making 100-octane or some major ingredient thereof, such as base stock or blending agent. In June 1943, there were 47 such refineries, of which 28 were being supplemented by still more new refineries.

When all of the construction work was completed on these 47 refineries, they would be able as a group to produce 85% more aviation gasoline than they did June 1942. There were 26 other refineries under construction which were scheduled to make 100-octane. In addition to all of these, there were 53 refineries in June 1943, making some raw material of 100-octane, and some of these produced the completed product as well. Thus, there was a net figure of 126 domestic refineries which were or would by the spring of 1944 contribute to the vast aviation gasoline program. In Oct. 1943, it was stated that production of 100-octane aviation gasoline was more than four times greater than in the early months of 1943 and that within a few months it would be about eight times greater.

TOTAL WORLD PRODUCTION OF PETROLEUM and output of the three principal producing countries, as compiled by *The Mineral Industry*

Altogether approximately $900,000,000 was being invested in production facilities for 100-octane gasoline; more than 75% of this investment being by the oil companies and remainder by the government.

Petroleum for Synthetic Rubber.—Butadiene, a petroleum derivative, forms the principal ingredient of Buna-S, the synthetic rubber made under the U.S. government's synthetic rubber program. Before Pearl Harbor there were no more than 30,000 tons of synthetic rubber being made in the United States. Through the Defense Plants corporation, the government undertook to erect new plants and finally laid out a program for over 800,000 tons yearly of Buna-S synthetic rubber. The annual rate of 800,000 tons was achieved late in 1943.

Of the total butadiene required for this huge program, petroleum was supplying 75%; alcohol the balance. As of Nov. 1943, some 30 butadiene and styrene plants had been constructed or were nearing completion. Most of these plants producing materials for synthetic rubber were financed by the government but were company-operated.

Pipe Line Construction.—The oil transportation system in the United States for transporting over 1,500,000 bbl. a day from the mid-continent and Gulf coast to the eastern seaboard was transformed after Pearl Harbor. The tanker service which had moved 95% of this oil was badly disrupted because of submarine warfare and the necessity of using tankers in other areas. In June 1942, the War Production board approved construction of a pipe line two feet in diameter—the "Big-Inch Line"—from Texas to Illinois and later authorized its extension to the Atlantic coast.

The building of this line, the world's biggest, with a capacity of 300,000 bbl. daily, was carried out by an organization drawn from the oil industry and was an epic achievement in construction. The main line, 1,381 mi. in length, laid through swamps, over mountains and across rivers, despite floods and storms and the worst winter conditions, was completed in 350 days in June 1943.

A second 20-in. line was being built over practically the same route. The two lines were expected to move more than 500,000 bbl. of oil daily and, with other measures adopted for increasing deliveries by tank car and barge, this would mean a greater volume of oil possible to be shipped into the Atlantic seaboard than ever received by the tanker route. Many other government-sponsored pipe line projects were underway or completed. The total cost of this pipe line program was estimated at approximately $250,000,000, and includes both government and private financing.

Petroleum Substitute Measures in U.S.—There was wide interest and support in proposed measures for the government to authorize the bureau of mines to build large pilot demonstration plants for making oil from coal.

According to Dr. A. C. Fieldner, chief of the technological branch of the bureau, the plants contemplated would have a capacity of about 100 bbl. of gasoline a day each and would cost about $3,000,000.

(*See* also BUSINESS REVIEW.) (L. M. F.)

Peyrouton, Marcel B. (1888–), French government official, was an ambitious civil servant who rose quickly in the French colonial service. He became secretary general of the government of Algeria, 1930, resident general of Tunisia, 1933, and resident general of Morocco, 1936. While visiting Italo Balbo in Libya in 1936, Peyrouton paid tribute to the "creative spirit of fascism." The popular front government found this a singular sentiment in a republican official; Peyrouton was removed from his Moroccan post and sent to Argentina as ambassador. In June 1940, he was again appointed resident general of Tunisia, but hastened home to join the Vichy government after the fall of France. By Sept. 1940, he was Vichy interior minister and he embarked on a series of moves that earned for him the hatred of French underground and anti-nazi groups. He ordered the arrest of Paul Reynaud and Georges Mandel, signed Vichy's anti-Jewish laws and employed strong punitive measures to crush the underground movement. After a bitter quarrel with Pierre Laval, Peyrouton resigned in Feb. 1941; Adm. Jean Darlan then returned him to Argentina as Vichy's ambassador, but when Laval returned to Pétain's favour, Peyrouton quit his post. On Jan. 19, 1943, Gen. Henri Giraud named Peyrouton to the post of governor general of Algeria. De Gaullists attacked the appointment, charging that Peyrouton was a Vichyite and fascist. As a result of De Gaulle's increasing influence, Peyrouton was compelled to resign, June 1, 1943. In November, he appeared before a French commission probing treason charges and on Dec. 21, Peyrouton was arrested and imprisoned on charges that he suppressed French underground groups during his tenure as Vichy interior minister.

Phelps, William Lyon (1865–1943), U.S. educator and author, was born Jan. 2 in New Haven, Conn. He was graduated from Yale in 1887, took his Ph.D. from the same school in 1891. In the latter year, he also took his A.M. degree from Harvard and remained there for a year lecturing on English. Later, he returned to Yale where he was a member of the English department for 41 years, and served as Lampson professor from 1901 until his retirement in 1933. For many years he was voted Harvard's most inspiring professor and young collegians jammed his classes in contemporary drama and Tennyson and Browning. In 1895, he started the first modern novel class at Harvard and was credited with introducing Russian novelists to English readers. His genial humour and sense of the dramatic made him popular as lecturer and critic. His contributions to magazines and his syndicated newspaper column, "A Daily Thought," brought him a reader audience calculated in the millions, and his annual list of the best of current literature appeared regularly in the nation's newspapers. His books, chiefly on English literature, old and new, include: *The Beginnings of the English Romantic Movement* (1893), *Essays on Modern Novelists* (1910), *Browning* (1915), *The Advance of the English Novel* (1916), *The Advance of English Poetry, The Twentieth Century Theatre* (1918), *Reading the Bible* (1919), *Essays on Modern Dramatists* (1920), *Some Makers of American Literature, As I Like It* (1923), *What I Like in Prose, What I Like in Poetry* (1934) and *Autobiography with Letters* (1939). Dr. Phelps died in New Haven, Aug. 21.

Philadelphia. Third largest city in the U.S.A. and the largest city in Pennsylvania, Philadelphia had a population of 1,931,334 by the federal census of 1940. It was estimated that this had grown to 2,200,000 in 1943 largely because of the influx of white and Negro workers from the south attracted by the high wages paid in war industries. On the death of Mayor Robert E. Lamberton in the summer of 1941, Bernard Samuel, Republican, president of the city council, became acting mayor under a provision of the city charter, to serve for the remainder of the term for which Mr. Lamberton had been elected. Mr. Samuel was nominated by his party for the full term in 1943 to run against the Democratic candidate, William C. Bullitt, former ambassador to Russia and to France. Mr. Samuel was elected by a majority of about 65,000 and the Republicans retained control of the council by a large majority. In accordance with the policy to keep the courts out of partisan politics ten sitting judges were re-elected with the support of both parties. The assessed valuation of taxable property was $2,369,916,667 in 1943 and the city debt was $476,000,000. The appropriation for current expenses of all kinds was $92,678,761. A wage tax of 1½% yielded $18,666,667 in 1943. This tax was reduced to 1% for 1944. Three members of the election board and a watcher from a division in the 47th ward were tried on charges of making false election returns and found guilty. Two of them were also convicted of fraudulently writing names on the certificates of voters. Efforts of the federal government to check the activities of German sympathizers resulted in a court order directing a leader of the German-American Bund in the city to leave the eastern defense area and in the cancellation of the citizenship of another leader of the bund. (G. W. Do.)

Philately. Philatelists will probably remember 1943 as the year inflation hit stamp prices! For stamps are luxury items, with no ceilings or other let or hindrance, and prices soared. Supplies were definitely limited, since none of the usual accumulations that formerly followed the best markets could move from country to country; and since the United States was avid for stamps and without imports, there was no reason during 1943 for prices to do aught but soar.

War wages and lack of other luxury goods placed philatelists in a position to bid against each other for available items, and the lack of other amusements turned many former collectors back to their albums.

With the centenary of the first United States stamps, those of 1847, but four short years away, fine items of that emission were particularly in demand.

The auction of the holdings of the late Col. E.H.R. Green, which began in 1942, continued throughout 1943 and was not expected to be concluded until 1944. The trend of prices was clearly shown by this, for the estimates made of values in 1942, which were rather accurately reached in the first sales of that year, proved too low by an estimated 26% in 1943, and stamp dealers predicted further increases over the early estimates before 1944 closed.

Stamp issues of the axis and its satellites being forbidden, both by common sense and the decrees of many of the United Nations (including the United States), the trend previously marked in 1942 continued in 1943—fewer stamps were issued. The Standard catalogue recorded fewer than 1,000 new varieties added in 1943, and it was notable that many of these fell definitely into what might be termed "propaganda" stamps. Though it was long evident that many commemoratives served as advertising, stamps were increasingly being used frankly to carry messages of policy and expression of governmental issues.

The "Four Freedoms" Stamps.—For one example, in 1943 the United States issued a one-cent stamp designed by a sculptor, Paul Manship. It shows a warrior carrying the torch of freedom with a tablet commemorating the Four Freedoms enunciated by President Roosevelt and Winston Churchill in the Atlantic charter in these short words: "Freedom of Speech and Religion, from Want and Fear."

Less happy was the choice of design for the series of five-cent

values honouring the "Overrun Nations"—those unhappy victims of the war's ferocity. One frame, of undistinguished merit, was used for the entire series, all in the same queer shade resembling gray, and the flag of the nation honoured was placed in full colour therein.

Breaking the custom of 50 years, the stamp was partially printed by contract. The frame was prepared by the treasury's bureau of printing and engraving, but the coloured flag was added by the American Bank Note company, the same firm which last held a contract for the production of U.S. stamps in 1893.

The Mysterious A.M.G. Stamps.—Shortly after the occupation of Sicily by Allied troops, there were rumours of "Allied Military Government" stamps in use in that area. Later, these rumours were confirmed. A set of stamps in Italian currency was issued in 1943, bearing the caption "Allied Military Postage" and the value in figures, with the words "Italy" and the currency above and below, respectively. The values were 15, 25, 30, 50 and 60 centesimi, 1, 2, 5 and 10 lire.

Apparently, these stamps were issued for the use of the civilian population of the occupied areas of Italy, for military mail needs no stamps and is handled through army post offices. Though these stamps were the product of the U.S. bureau of printing and engraving, they were not U.S. emissions, being for the Allied Nations. They were for sale only in the occupied regions. Presumably they would be considered as "occupation of Italy stamps."

The War.—The war-inspired issues of the United States have already been mentioned. Russia found time, despite valiant efforts in the field of battle, to produce some more colourful emissions depicting the actions and the care of soldiers. The Tehran conference of the leaders of Russia, Britain and the United States was also marked by Russia with stamps. Curaçao issued some semi-postal stamps to raise funds for prisoners of war.

Italy, besides being the guinea pig for the A.M.G. stamps, also had the anomalous condition of using stamps in German-occupied states bearing the portrait of King Victor Emmanuel III, who surrendered to the Allied Nations! During the last week of 1943, rumours leaked out of German-held Italy that the remaining stamps would be "blacked out," the king's portrait being obliterated and the stamps given some sort of Fascist surcharge.

Commemoratives.—Brazil, the first country of the Americas to issue postage stamps, commemorated that fact in 1943 with an issue reproducing the original stamps of 1843 as part of the design. Brazil also commemorated numerous other events, mostly of purely local interest. A disquieting note was the appearance of many minor varieties of these issues. Before the revolution late in 1943, Bolivia issued a series commemorating the centenary of the department of El Beni. The various French colonies, not content with "France Libre" and "France Combattante" issues, commemorated many events.

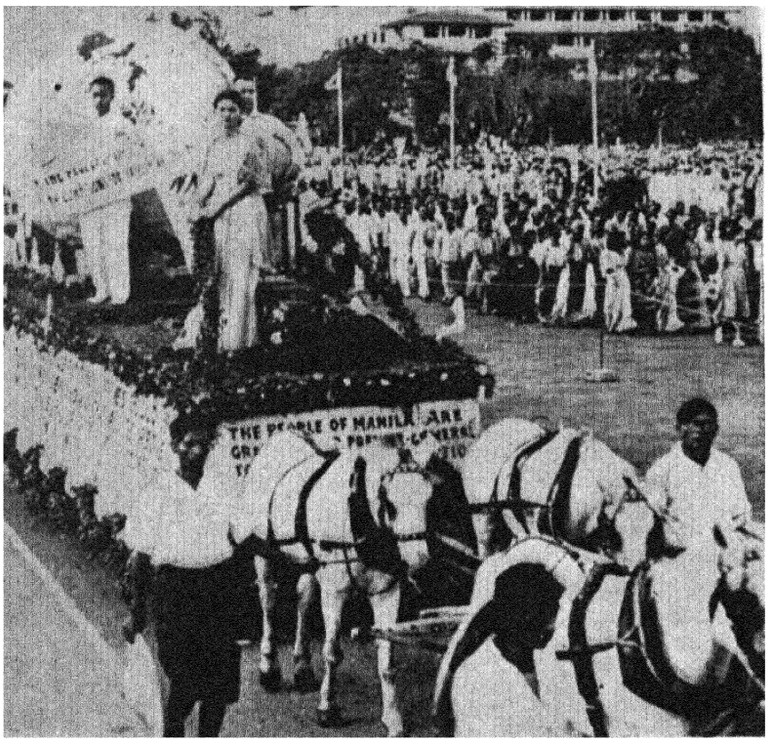
Literature.—The Barry Bowl, a cup given annually for the outstanding stamp department in a daily newspaper (named in honour of the late Ralph A. Barry, who conducted such a column) was awarded to the New York *Sun* and its stamp editor, Franklin J. Bruns, Jr.

The Standard catalogue continued in 1943 its experiment of publishing three editions; one for the stamps of America and the British commonwealth, one for the rest of the world, and a combined edition. Protests over the new arrangement continued. Because of the long lag between rapidly changing prices and the catalogue values, the publishers were releasing lists of recognized changes to the philatelic press each few weeks.

The interest in essays and proofs that had long been evidenced by serious philatelists blossomed in a new Essay-Proof society, organized in the latter months of 1943. Nearly 100 members were enrolled for the first meeting, and the society planned to publish a quarterly journal, beginning in the first quarter of 1944. Clarence Brazer, of New York, whose articles on proofs and essays appeared in the *Collectors' Club Philatelist* in 1942 and 1943 was both president of the new society and editor of its journal.

(M. HA.)

Philippines, Commonwealth of the.



The commonwealth of the Philippine Islands comprises the archipelago of the same name ceded by Spain to the United States in the treaty of Paris, 1898. The chain of approximately 7,100 islands with a total area of 115,600 sq.mi. falls between north latitudes 4° 21′ and 21° 10′ and between east longitudes 116° and 127°. Lying about 800 mi. off the east coast of Asia, the Philippines stretch from Formosa on the north to Borneo on the south. By regular steamship routes, Manila is 631 nautical miles southeast of Hongkong, 1,757 mi. southwest of Yokohama, 1,370 mi. northeast of Singapore, 4,838 mi. west of Honolulu and 6,929 mi. southwest of San Francisco.

The Philippines are acknowledged to have a strategic geographic position. They command the principal trade routes connecting the north Pacific coasts of America and Asia with Southeast Asia, the East Indies and India, and they offer a suitable western anchorage for a system of modern air and naval bases extending from Pearl Harbor through the Marshall, Caroline and Marianas islands.

The total area is 115,600 sq.mi. The last official census, 1939, gave the population as 16,000,313, including the following non-Filipino nationalities: Chinese 117,487; Japanese 29,057; Americans (U.S., exclusive of armed forces) 8,709; Spanish 4,627; Germans 1,149; British 1,053. Calculated on recent rates of increase without allowance for the effects of war and invasion, the population at end of 1943 should have been somewhat in excess of 17,900,000. Principal religions according to census of 1939: Roman Catholic, 12,603,365; Aglipayan (Independent Philippine Catholic), 1,573,608; Mohammedan, 677,903; Protestant, 378,361. In addition about 680,000 were pagans following various animistic cults. The principal cities and their populations were: Manila, the political and commercial capital on the northern large island of Luzon, 623,492 (not including several large suburbs); Cebu, 146,817; Iloilo, 90,480; Legaspi, 41,468.

History.—The political organization of the Philippines is determined by the Philippine Independence act of 1934 (48 Stat. 456) as amended. Under this act an autonomous commonwealth was established on Nov. 15, 1935, and independence was set for July 4, 1946. During the commonwealth period the United States remains sovereign with final control over the public debt, currency, trade relations, immigration, foreign affairs, armed forces and military and naval reservations and bases, and with the right to intervene for the preservation of government, the protection of life, property and individual liberty, and the discharge of government obligations. All Filipinos owed allegiance to the United States, and every officer of the commonwealth was required to declare under oath "that he recognizes and accepts the supreme authority of and will maintain true faith and allegiance to the United States." The chief officer was the United States high commissioner to the Philippine Islands, a representative of the president of the United States, required to be recognized as such by the commonwealth government, by the commanding officer of the military forces, and by all other officers of the United States in the islands.

The commonwealth government had a constitution adopted under the terms of the Independence act. In form and style it was that of a highly centralized, representative, tri-power republic,

MANILANS stage [illegible] during the visit of Premier Hideki Tojo to the Philippines in 1943. The pictures of Tojo's visit, received through neutral sources, were the first photographs from the Philippines to reach the United States after the islands' fall in 1942

with reservations covering U.S. sovereignty. The executive consists of a president and vice-president elected at large. The legislature is a senate elected at large and a house of representatives elected by districts. The judiciary consists of municipal courts, courts of first instance (provincial), a court of appeals and a supreme court (with provision for appeal to the United States supreme court). All judges are appointed by the executive. There are no juries and decisions are directly given by the judges themselves. For purposes of local government and central government administration the country is divided (census of 1939) into 49 provinces and 9 chartered cities; the provinces into 1,170 municipalities; the cities and municipalities into 16,939 barrios or villages.

In 1943 the authority of the high commissioner was vested in Harold L. Ickes, secretary of the interior. The commonwealth president was Manuel L. Quezon, and the vice-president was Sergio Osmeña. Other officers were the resident commissioner to the United States, J. M. Elizalde, who was a delegate to the United States congress; and the auditor general, Jaime Hernandez. These officers, together with an appointed wartime cabinet, resided in Washington, D.C.

President Quezon and Vice-President Osmeña were inaugurated for their second terms on Dec. 30, 1941, at Corregidor, and on their arrival in Washington in May 1942, they set up the official executive establishment of the commonwealth. Due to a constitutional eight-year limitation on the presidential term of office, President Quezon would have surrendered his office on Nov. 15, 1943, and Vice-President Osmeña would have succeeded automatically. However, at the request of the commonwealth government in exile the U.S. congress in Public 186, approved Nov. 12, 1943, amended the Philippine constitution in such manner as to continue Quezon in office as president of the commonwealth "until the president of the United States shall proclaim that constitutional processes and normal functions of government shall have been restored in the Philippine Islands." The act provides that upon such proclamation the vice-president shall become president and serve until his successor is elected.

In addition, the U.S. congress passed through the senate and had pending in the house two resolutions. The first of these resolutions provides for: (a) U.S. land, sea and air bases in the Philippines, and (b) for advancing the date of independence when the enemy shall have been expelled and democratic processes of government restored. The second provides for a joint U.S.-Philippine economic commission to consider questions of postwar rehabilitation, finance, economy and trade relations.

The commonwealth government was in 1943 considered to be one of the United Nations and participated in various of the conferences held under its auspices.

By the end of 1942 presumably all important coastal points in the principal inhabited islands were under enemy control, but reliable reports indicated that attacks from guerrilla bands operating in isolated or mountainous up-country districts continued actively throughout 1942 and 1943. Several prisoner of war camps were established on Luzon, Palawan and Mindanao islands. More than 3,500 civilians (approximately 2,500 Americans and 1,000 British and other Allied citizens) were held in Manila at Camp Santo Tomas. Other civilian concentration camps were at Baguio and Davao.

Filipinos, allowed limited freedom of residence, occupation and religion, were subjected to a carefully designed policy of attraction. The Japanese reopened a few elementary schools, but all textbooks were censored and the curricula were distorted to include the Japanese language and to suppress U.S. and native history, civics and culture.

Jorgé Vargas, formerly executive secretary to President Quezon, with cabinet rank, was appointed late in Jan. 1942 by the Japanese commander in chief in the Philippines to be chairman of the executive commission. This commission assisted the Japanese military authorities in the establishment of "Central Administrative Organs and Judicial Courts" which apparently consisted of 7 departments and 40 or more bureaus and courts. The departments were reportedly headed by Filipinos formerly holding high positions in the commonwealth government.

The Japanese prime minister, Tojo, announced in May 1943 that "independence" would be granted the Philippines before the end of the year. In June the military administration with the collaboration of the Vargas executive commission formed a committee to prepare for independence. A totalitarian constitution was drawn up and "independence" was proclaimed on Oct. 15, 1943. The "president" was José P. Laurel, a member of the former legitimate supreme court. He was assisted by a group of "ministers of state" comprising practically the same officers as those in the Vargas executive commission. Vargas became "ambassador" to Japan. The new puppet government avowed its position to be that of a "full-fledged member of the Greater East Asia Co-prosperity Sphere"; it advocated drastic elimination of all elements of western culture and active defense against the return of the United States to the islands. To facilitate the latter aim the constabulary was being increased to an army of 50,000 or more, and an alliance had been entered into with Japan. A single national fascist party, the "Kalibapi," was organized. Its members controlled the legislative, administrative and judicial branches of the puppet government.

Underground reports indicated that the mass of the common people of the Philippines, as well as a majority of the wealthier, educated classes, held the puppetry in great contempt. It appeared to be tolerated only so far as it forced itself on the people through control of the distribution of rice and other necessities. Attempts on the part of the Japanese and the puppet government to capture guerrillas, or to attract their surrender through repeated extensions of amnesty laws, met with little success.

The following digest of education, finance, trade, etc. is based upon the last available data prior to the Japanese invasion. Reports as to current conditions under the enemy, while too frag-

mentary and unreliable for publication, indicated that nearly all schools were closed, that the islands were suffering an enormous inflation due to the circulation of Japanese military currency, that trade even with Japan was negligible and that agriculture, manufacturing and mineral production were well below normal.

Education.—Public schools, March 1940: number 12,057; enrolment, primary 1,572,639; intermediate 277,574; secondary 90,579; collegiate (normal and technical) 3,777; total 1,944,569. Private schools, June 30, 1940: number 439; enrolment, kindergarten 2,844; primary 41,861; intermediate 22,578; secondary 51,055; collegiate 31,153; total 149,491; in addition, recognized schools (136) offering special vocational courses had 9,188 enrolment.

Finance.—The monetary unit is the peso, fixed at a mint par of U.S. $0.50; exchange rates showed only negligible fluctuations from the par rate in 1941. Estimated general fund balance, June 30, 1942, on deposit in the U.S., 100,000,000 pesos. Total bonded indebtedness, June 30, 1941, 149,507,000 pesos; total sinking fund reserve 77,484,863 pesos. Currency dollar reserves on deposit in the U.S. as of June 30, 1942: cash surplus exchange standard fund plus cash balance treasury certificate fund U.S., $134,169,734. Currency in circulation and available per circulation as of Sept. 30, 1941, 222,407,808 pesos, including notes of the Bank of the Philippine Islands (1,358,385 pesos) and of the Philippine National bank (2,299,816 pesos).

Trade.—During 1941, Philippine overseas markets, except in the U.S., were virtually closed on account of limited tonnage and restrictive control of foreign exports and funds. Overseas trade values Jan. 1 to Sept. 30, 1941, were: Shipments to U.S. 227,000,000 pesos (of which 77,000,000 pesos were gold and silver bullion and concentrates); exports to foreign countries 41,000,000 pesos; total outward 268,000,000 pesos; shipments from U.S. 180,000,000 pesos; imports from foreign countries 43,000,000 pesos; total inward 223,000,000 pesos. The total overseas trade value, 491,000,000 pesos, was 11% in excess of that for the same period in 1940 and only 16% under the total for the entire year of 1940. Outward values of principal commodities, Jan. through Sept. 1941: coco-nut oil 22,000,000 pesos; copra 17,000,000 pesos; desiccated coco-nut 9,000,000 pesos; abacá 29,000,000 pesos; cordage 3,000,000 pesos; embroideries 6,000,000 pesos; logs, lumber 7,000,000 pesos; gold and silver bullion and concentrates 77,000,000 pesos; other minerals 12,000,000 pesos; centrifugal sugar 48,000,000 pesos; refined sugar 7,000,000 pesos; cigars 4,000,000 pesos; pineapples 3,000,000 pesos. Similarly for inward commodities: wheat flour 10,000,000 pesos; rice 1,000,000 pesos; other foodstuffs 25,000,000 pesos; iron and steel 15,000,000 pesos; automotives 8,000,000 pesos; machinery 17,000,000 pesos; nonmetallic minerals and chemicals and manufactures thereof 43,000,000 pesos; textiles 50,000,000 pesos.

Communication.—In 1940: railroads, 840 mi.; highways (kilometres) first-class 11,771.9; second-class 7,393; third-class 3,795.1; trails 4,912.1. Motor vehicles registered: automobiles 33,898; trucks 20,236, motorcycles 630. Airways: 1,171,453 passenger miles; 20,407 passengers; 3,083,415 lb. air express; 15,855 lb. air mail. Telephones, 31,419. Telegraph lines 14,716,930 kms. Broadcasting stations 6. International cable and radio services 5.

Agriculture.—The total estimated value of crops in 1938 was 417,144,000 pesos. Area planted and value, leading crops; palay (rough rice) 4,722,640 ac., 136,423,000 pesos; sugar cane 563,160 ac., 113,559,000 pesos; coco-nut 1,588,210 ac., 92,126,000 pesos; abacá 1,254,760 ac., 22,672,000 pesos; corn 1,736,410 ac., 19,424,000 pesos; bananas 227,240 ac., 10,312,000 pesos; tobacco 185,250 ac., 4,125,000 pesos. Livestock and poultry (1939) were valued at 141,514,451 pesos. Number and value: carabaos 2,918,730, 78,826,516 pesos; hogs 4,348,515, 26,100,326 pesos; cattle 1,349,264, 20,077,610 pesos; chickens 25,365,102, 8,994,591 pesos; horses 340,433, 6,222,661 pesos; goats 402,173, 874,155 pesos; ducks 690,868, 418,592 pesos.

Manufacturing.—Chief manufactures are centrifugal sugar, copra, coco-nut oil, desiccated coco-nut, cordage, cigars and cigarettes and embroideries. Production of sawmills in 1940 was 332,908,721 bd.ft.; number of mills 148.

Mineral Production.—Total estimated value of minerals produced in 1940 was 91,626,384 pesos. Chief products: gold 1,096,745 fine oz., 76,563,888 pesos; iron 1,221,126 long tons, 5,633,728 pesos; copper 20,014,918 lb., 3,487,701 pesos; chromite 189,919 long tons, 2,661,764 pesos; silver 1,394,736 fine oz., 1,874,094 pesos; manganese 48,036 long tons, 1,287,011 pesos; lead 2,080,381 lb., 117,927 pesos; platinum 6.03 troy oz., 271 pesos. (*See* also JAPAN; WORLD WAR II.) (E. D. H.)

Philosophy. In 1943 many philosophers turned to the great simplicities. The destiny of man, the ways of life, the hope for human culture: what can be said of them in time of crisis? Though little that is revolutionary appeared in formal works of philosophy, there was a good deal of overhauling, new evaluation, and reversal of emphasis.

The Nature and Destiny of Man by Reinhold Niebuhr presents a doctrine of sin and salvation, final judgment and transcendent ends that surprised many who knew the author as a social liberal and religious modernist. In the same way *Education Between Two Worlds* by Alexander Meiklejohn surprised those who knew the author as an educational progressive. He attacks John Dewey on the grounds: (1) that he tends to reduce intelligence to scientific method, (2) that the state for him has a negative function, (3) that he gives no meaning to "fair" or "objective" and thus has no criterion of criticism. Meiklejohn repudiates Locke and returns to the unity of knowledge and civilization of Comenius. He rejects relativism, pragmatism, James, and what he terms the disintegrations of Protestant-Capitalist culture. In *Education at the Crossroads,* by Jacques Maritain, the Catholic philosopher, there is on the other hand a definite, if unrecognized, sympathy with the pragmatic, experimental point of view from which Meiklejohn moves away. In *The Destiny of Western Man,* Walter Terence Stace emphasizes the primacy of reason and of sympathy in democracy and its accord with the true nature of man, while in *Paths of Life, A Preface to a World Religion,* Charles Morris courageously proposes Maitreyism, a post-Buddhist faith, to orient men in and beyond the contemporary ideal.

In the arts, too, valuations were revised. *Art and Freedom* by Horace Kallen is a generous effort to orient art in respect to the great human values. In *The Aesthetic Process,* Bertram Morris conceptually analyses art as process. In *The Language of Poetry,* edited by Allen Tate, an important effort is made by four distinguished men of letters to interpret poetry, not as emotion and response, but as a kind of language. *Music and the Line of Most Resistance,* by Artur Schnabel, is an enlightening study by a pianist who knows his field operationally as well as symbolically. *Romanticism and the Modern Ego,* by Jacques Barzun, is a brilliant support and generalization of the romantic thesis.

Schelling's Letze Philosophie, by Horst Fuhrmans, is an important addition to the literature of German idealism. *America's Progressive Philosophy,* by Wilmon Henry Sheldon, is a significant and original study of modern philosophies of process. *The Philosophy of G. E. Moore,* edited by Paul Arthur Schilpp, was the year's addition to the well-known *Library of Living Philosophers. Metaphysics and the New Logic* by Warner Arms Wick and *The Moral Ideals of Our Civilization* by Radoslav Andrea Tsanoff are efforts to co-ordinate some philosophical thinking

with new ideologies. (B. B.)

Phoenix Islands: *see* PACIFIC ISLANDS, BRITISH.

Phosphates. Mine production of phosphate rock in the United States in 1942 was 4,818,938 long tons, and deliveries 4,644,240 tons, small decreases from 1941. Mine production was greater than sales, and producers' stocks were at the highest level in a decade, 1,867,000 tons.

Production in northern Africa (Algeria, Tunisia, Morocco and Egypt) is normally greater than in the United States, but was in 1943 presumably disorganized by the extension of the war to this area. (G. A. Ro.)

Photography. Photography was put to its greatest test during 1943. With the entire world at war, practically every phase of photography was called upon to help bring the whole conflict to an early conclusion. Photographers were trained by the thousands and were actively working with the armies in every fighting country. Britain and America led the field in the production of new techniques as well as new cameras, films and paper. The electron microscope revealed previously unseen structures in war metals or served in detecting minute organisms in fighting disease. New lenses, a new lens cement and even a new optical glass with a high index were only a few of the important improvements.

The photographic manufacturers were producing all their products in greater quantities than ever before. The amateur photographer was sharply curtailed in his use of photographic goods. However, there was enough film and photographic paper available so that the average amateur could still carry on his interests on a limited scale. Toward the end of 1943 some products, such as photoflood bulbs, were more easily obtained than at the beginning of the year.

The output of the camera and lens plants of the Eastman Kodak company was almost entirely confined to the armed services, and enormous quantities of sensitized materials of all kinds were made for the forces. The camera and optical-goods factories were expanding and adapted to the large-scale manufacture of nonphotographic articles requiring a high degree of precision. Kodak also developed a new Spectrum Analysis No. 2 plate, which had greater speed than the previous ones. The Kodagraph Magenta contact screen was placed on the market for making screen negatives for use in photolithography by the albumin process. The year 1943 marked the 20th birthday of the Ciné-Kodak and the first practical system of making home movies.

Previously a large number of lenses cemented with natural Canada balsam were broken, discoloured and rendered useless because of extremes in temperature met with in desert fighting and stratosphere flying. After two years of research, Kodak produced a new cement which met every condition of extreme heat and cold and high humidity more satisfactorily than any previously known cement.

Ansco colour film, previously available only to the armed forces, was offered to essential war industries to meet the demand for a colour film that could be processed by the consumer immediately following exposure. Ansco colour paper was also introduced to both the armed forces and essential industries. This material has a multilayer emulsion, with incorporated colour components which couple with the developer by-products to produce direct colour prints. Colour prints can be made from either colour-separation negatives (successively exposed through three colour-separation filters) or from complementary colour negatives (single exposure). An interesting and practical application of Ansco colour paper was the making of machine drawings, wiring diagrams, etc. in quantity, the lines being differentiated by colour for facilitating line production of intricate devices. The armed forces adopted Ansco colour paper as an adjunct in the preparation of military maps in colour.

War Photography.—Many important photographic developments were applied directly to war work. The largest and most complete naval photographic laboratory in the world designed for the navy by the Eastman Kodak company and incorporating apparatus in research instruments was in operation at Anacostia, D.C. More than a hundred of the navy personnel of the laboratory were given special training at the Kodak Park works in Rochester, N.Y. A smaller naval photographic laboratory was also completed at Norfolk, Va. Portable units, for the signal corps photo outfits, were built around the Kodak 35-mm. camera, the Kodak portable miniature enlarger and the Kodak day-load tank. All extra space was used to store securely all necessary equipment, such as trays, timers, film, paper, etc. This portable outfit could be used for enlarging or copying. The outfit was enclosed in a good-sized suitcase and could be set up or closed in less than one minute.

Sixteen-millimeter ciné cameras were used extensively in making combat pictures and training films. In many instances photographic reticles were used instead of engraved reticles on war and peacetime instruments. The Eastman Kodak company was producing large numbers of these for the armed forces. Because it is unaffected by heat, cold or moisture, Kodapak, a relative of safety film base was being used for insulating plane wires (instead of rubber) and field communication wires and for wrapping field rations.

Kodak developed a tropical prehardener which enables the processing of photographic negative materials at prevailing temperatures in the tropics without producing any deleterious effects, physically or sensitometrically. An extensive investigation of the washing of photographic film and paper products was also completed; recommendations for the complete removal of the last traces of silver and hypo retained from the fixing process were made. Probably the most useful fact obtained, from the viewpoint of the armed services, was the remarkable decrease in washing time effected by the use of sea water.

A new so-called spray emulsion was introduced by the Ansco company to coat metal sheets or other material with a sensitive layer for photographic template production, used extensively in many war factories. This technique had the advantage over transfer methods, in that sheets of any size and shape could be sensitized.

The Ansco research laboratory proposed an improved procedure for measuring contact printing density.[1] In connection with this study an investigation of the spectral transmission characteristics of optical wedges was carried out, and it was shown that wedges made of photographic silver are superior to those made of colloidal carbon.

The previously described Ansco-Sweet photoelectric densitometer was made commercially available. In practice the instrument proved to be more precise than visual densitometers, faster operating and capable of giving more reproducible data.

Aerial Photography.—One of the most important uses of photography in World War II was in the field of aerial work. Tens of thousands of photographs were made to reveal before and after conditions in enemy territory. Along with this accelerated use of photography in the air came new equipment, some of which was not ready for public release.

One of the sensational developments was the new shutterless

[1] M. H. Sweet, "The Spectral Characteristics of Optical Wedges," *Jour. Optical Soc. of Amer.*, 33: 194–208 (April 1943).

continuous-strip aerial camera. This camera makes a continuous picture as the film passes across a narrow slit at a speed which is synchronized with the image which passes below the lens. The camera will take about 200 ft. of film at one loading. One continuous negative could be made or short lengths of the film strip could be made. Colour film or black and white could be used as required. This continuous-strip aerial camera had various important applications for aerial reconnaissance work.

During peacetime, it was anticipated, this camera would find many commercial uses for aerial surveys. The geologist, for example, when using colour film might be able to trace the outcroppings of a fault that might give evidence of a new oil field.

During the year the Eastman Kodak company announced the production of Kodacolor aerial reversible film for military aerial photography. This colour film could be processed by military personnel in the field. The film is fast enough to permit exposures at 1/60 sec. at f/8, or approximately a Weston 32-exposure factor. For the first time it was possible to make colour photographs from high altitudes using this new Kodacolor film and special filters that counteract the effective haze.

Mobile photographic trailers for the army air forces to permit quick developing and printing operations in the field were designed by Eastman processing engineers. Several dozen air force personnel were trained at Kodak Park for service as instructors in the operation of the darkroom-trailer equipment.

Lenses made of Kodak's rare-element optical glass, giving greater speed without loss of definition and covering power, stepped up considerably the effectiveness of aerial photography. This was the first basic discovery in the optical-glass field for more than half a century and made it possible for aerial cameramen to do their jobs from a safer height and at the same time obtain better pictures. The new aerial lenses made by Eastman included 40-in. telephoto lenses, and lenses of aperture f/2.5 in 12-in. and 7½-in. focal lengths.

New fast aerofilms were introduced by Kodak for the armed services during the year. The infrared film for aerial photography was nearly as fast as the fast panchromatic films.

During 1943 the Polaroid corporation, together with the marine corps and the U.S. navy respectively, worked out an extremely rapid technique for the preparation of large areas of stereoscopic mosaics. The procedure was suitable for field use in preparing large-area vectographs for staff study. One of the novel features of the technique was the use of water in place of an adhesive to hold the prints down. The large-area vectograph film introduced by the Polaroid corporation was 11 x 14 in. in size. This was the film used in reproducing the stereoscopic aerial mosaics.

New equipment, especially designed for the army air forces in collaboration with their photographic laboratories, included a contact printer with cold Argon lamps so constructed that the illumination is adjustable for printing trimetragon aerial negatives of nonuniform density; a compact optical printer for rectifying aerial negatives; a portable universal developing tank for 16-mm. and 35-mm. film; and a continuous 35-mm. strip printer.

Vast improvements were made in Ansco Direct Copy film—speed increased four times, gradation scale extended and made linear over a useful density range—providing more practical means for direct duplication of negatives by single exposure and development.

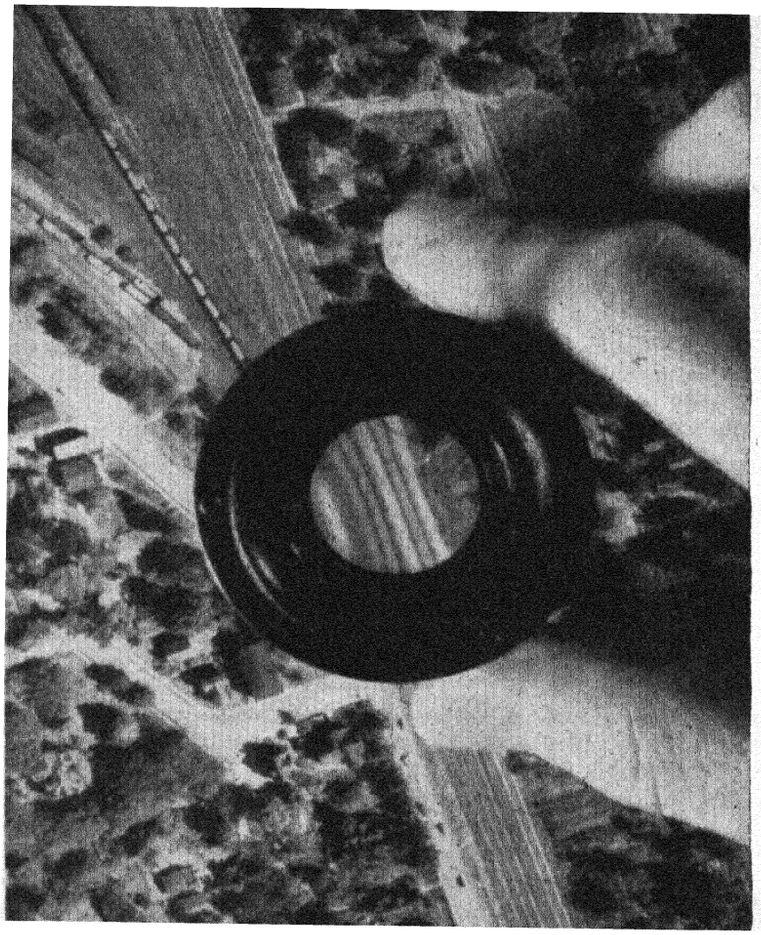
High-speed Photography.—Because of the accelerated war demands, high-speed cameras were developed and improved upon.

An important development was perfected by Dr. Robert W. Cairns, director of the Hercules Experiment station, Wilmington, Del. Dr. Cairns made the rotating-drum camera which is used to photograph the detonation waves of explosions, which travel 5 to 25 times as fast as sound. This camera records explosions of 1-kg. charges that are about 6 in. long. A slow explosion is one that lasts about 100-millionths of a second. This high-speed camera was used to record all the details of the activity of many war explosions.

The photo lamp department of the General Electric company reported that the rated peak lumens were increased on five of their photoflash bulbs. The Midget flashbulbs, such as Nos. 5, 6 and the S.M., were finding greater use in war photography as well as among the amateurs and news photographers. Quality of the flashlamps was maintained despite the use of substitute materials, which had been very difficult to work with. Substitution of brass-plated steel for brass lamp bases, substitution of a lower tin content solder for the conventional prewar solder in order to conserve tin, and substitution of iron leads for nickel and copper as a conservation measure had to be considered.

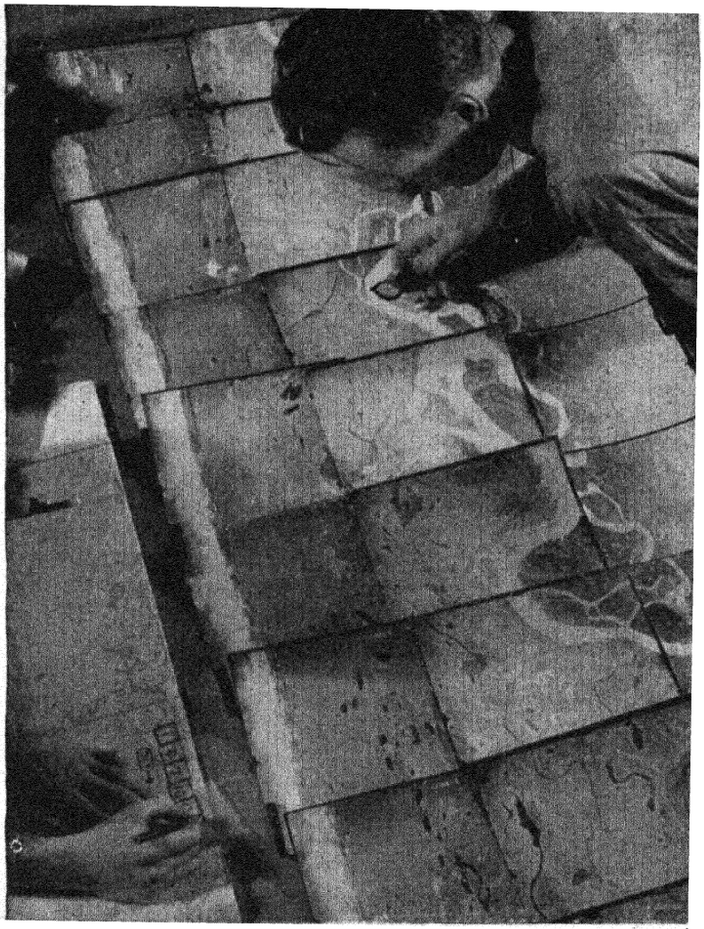
X-ray photography was applied more extensively for medical and industrial uses than in any previous time. One of the important developments was the use of 35-mm. film in an appropriate camera for copying the fluorescent screen on an X-ray machine. With this equipment it was possible to obtain X-ray records of thousands of workers as well as to give periodic checkups for members in the military forces. Also, a special film base was treated for the making of stereoscopic X-rays. Two images are photographed on the same area of film, the only difference being that they are not superimposed on each other but slightly separated in relation to the stereoscopic viewer.

The Ansco company developed special film for industrial radiography, having a higher speed to X-radiation and finer grain.



The Museum of Modern Art in New York city opened its new photography centre and announced the appointment of Willard D. Morgan, editor of the department of photography and of the centre. To photographers, students, critics, collectors, teachers and historians, the photography centre offers its resources of information. Its growing archives include biographical and technical material gathered from photographers themselves; wide contemporary and historical information in the manuals, albums, periodicals, exhibition catalogues and special publications in the library; the illustrated card catalogue of the museum's collection of photographs and similar catalogues of other important collections; and lantern slides, either for individual selection or lecture sets accompanied by text. Large and small exhibitions presenting important trends in creative photography are major functions of the department.

The Radio Corporation of America developed a new small model of the electron microscope which would undoubtedly make this revolutionary instrument available to a wider field of users.[2]



The Polaroid corporation produced polarizing coloured photographic filters. They combine in a single filter the functions of a standard coloured filter and a polarizing filter. A typical filter of this type is a polarizing yellow filter for use in obtaining dark sky effects. To the effect of the yellow filter is added the effect of the polarizer which, by rotation, can be used to control the apparent brightness of polarized sky light. Up to the close of 1943, the use of these filters was confined to military applications on visual and photographic instruments. Three dimensional instruction diagrams and photographs in vectograph form were developed for special military training purposes.

Microphotography.—Microphotography during the year continued to extend its usefulness in wartime in the fields of government, business and scholarship. Great progress was made in the V-mail or soldiers' mail plan and equally spectacular advances in the parallel and less publicized official mail on microfilm. Relatively little new equipment was presented for public inspection.

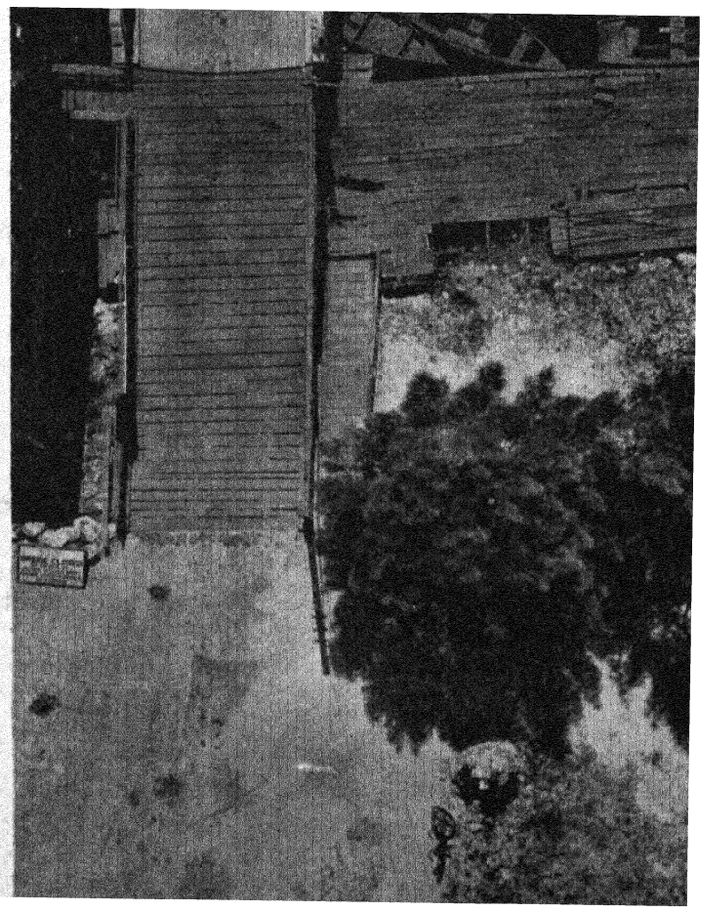
INDIVIDUAL TIES in the railroad tracks are discernible under a magnifying glass in this U.S. army photograph taken from an altitude of 10,000 ft.



OPERATORS indexing a strip of Army Air Force tri-metrogon photograpny onto an aeronautical chart

U.S. ARMY AIR FORCES high altitude photograph taken at approximately 38,000 ft. with a 40-in. telephoto lens. Detail in this photograph is not visible to the human eye at this altitude

TAKEN FROM A SINGLE-SEATER U.S. ARMY RECONNAISSANCE PLANE flying 310 m.p.h. at an altitude of 150 ft., this photograph has amazingly clear details. The film unrolls past a slit in the shutterless camera at a rate which varies with the speed and altitude of the plane

Several new and improved devices, however, were placed in operation and would presumably be made generally available at the close of World War II. Postwar planning activities were in full swing and a number of companies manifested a desire to introduce new equipment. Experimental and pilot models in some cases were already in existence.

Colour microfilm, although expensive, was becoming less so and was used for a number of projects. Outside this field, there were few developments in sensitive materials. One factor, however, of supreme importance was the enunciation by the National Bureau of Standards of a "Standard for Permanent Record Photographic Microcopying Film" and its corollary, "Standard for Temporary Record Photographic Microcopying Film."

The legal aspects of federal microfilming were changed somewhat by the repeal of the act of Sept. 24, 1940, entitled "Public Law No. 788, 76th Congress, Chapter 727, 3d Session, H.R. 10026," and the enactment into law of "Public Law No. 115, 78th Congress, Chapter 192, 1st Session, H.R. 2943." The latter incorporates all of the provisions of the former legislation and in addition specifies certain procedural changes and requirements intended to streamline the uses of the technique. State legislation for the record use of microphotography was extended by passage of similar acts by several states. The state of Illinois, for example, passed two separate acts legalizing the use of microphotography.

V-mail, which was developed by Kodak, reached its greatest usefulness during 1943. The Kodak company continued to give instruction courses in the processing of V-mail film and paper to the appropriate branches of the services. During the latter part of the year the war department released special information to promote a wider use of V-mail. It informed the public that the V-process insured the letter against loss, V-mail saved 98% of the space that ordinary mail would use on planes and ships for vital medical, food and munitions cargo, and that it saved time because it had priority over most types of mail.

Kodak made a number of new developments in recording materials, particularly a new paper for reflex copying.

The Ansco company (formerly known as Agfa Ansco) increased the speed of Ansco Direct Copy film four times. The gradation scale was extended and made linear over a useful density range, thus providing more practical means for direct duplication of negatives by single exposure and development. Physics. Research on all phases of military and naval science continued in 1943. More of it was based on the classical phenomena of physics than on the latest discoveries in the field of atomic structure. Such war work did not, of course, find its way into current literature, but it brought many new recruits to physics. Looking ahead, the American Institute of Physics, acting for the several societies of physicists in the United States, purchased a national headquarters for physicists at 57 E. 55th St., New York city. Early in 1944, this building was to house the editorial offices of the professional journals. The institute's important tasks were to encourage friendly cooperation among the numerous specialized groups of physicists and to play the role of co-ordinator in matters affecting professional standards, professional welfare and the support of scientific research.

Cosmic Rays.—Cosmic rays, as they are found in the earth's atmosphere, consist in the main of two portions. One of these, the soft component, is made up of electrons which can be stopped by a few centimetres of lead. Since the earth's atmosphere is equivalent in absorbing power to nearly 100 cm. of lead, these electrons must be of local origin. They are, in fact, produced in bunches here and there in the atmosphere and in other absorbing material by a very penetrating component of the rays. This penetrating component itself is created in the high atmosphere by primary rays which appear to come from interstellar space, whose exact nature was in 1943 still uncertain. Part at least of the penetrating component was known to consist of fast-moving mesotrons, particles of mass about 180 times that of the electron, which create "showers" of electrons as they pass downward. These mesotrons are, however, unstable, having a lifetime of about two-millionths of a second. This fact alone certifies that they must be of atmospheric origin. If their source were far away they would disintegrate before they reached the earth, changing, it was believed, into an electron and a neutrino, both moving with high kinetic energy derived from the mass-energy of the mesotron. New experiments to determine the mesotron's half life were reported by B. Rossi and N. Nereson. Their estimate was $2.15 \pm 0.07 \times 10^{-6}$ sec. Therefore, even if mesotrons moved with practically the speed of light, the chance is very small that one of them would survive a 20-mile journey. Nevertheless, enough survive for accurate measurement at sea level and in deep mines.

It is important to know if these ionizing mesotrons are the only source of the soft component of cosmic rays. As a result of experiments carried out underground, V. C. Wilson and D. J. Hughes deduced that mesotrons alone are responsible for the soft component below sea level, to depths as great as 600 m. in the earth. In the atmosphere, however, V. H. Regener's experiments lead to a different conclusion. With an ingenious arrangement of electrical counting tubes, he was able to record on photographic film the approximate paths of penetrating cosmic rays and of other rays created by them. In many cases showers of soft secondary rays were produced in the absence of any ionizing penetrating ray. At an altitude of 10,000 ft. he found that showers were produced nine times as frequently by nonionizing parent rays as by ionizing mesotrons. At lower altitudes, the ratio grew progressively smaller. Thus the penetrating component of cosmic rays must consist of two parts, one being composed of mesotrons, the other of some nonionizing radiation. However, the nonionizing radiation must be absorbed much faster than mesotrons in order that Regener's experiments may be consistent with those of Wilson and Hughes.

In 1943, R. A. Millikan, H. V. Neher and W. H. Pickering published a second report on their world-wide cosmic ray survey, which was designed to provide new information about the source of the rays. By measuring the intensities of the rays at different geomagnetic latitudes and at various elevations they were, in effect, using the magnetic field of the earth as a giant spectrograph to separate rays of different energies. Since many of the rays are charged particles, they tend to be deflected away from the earth at the equator but come to the earth's surface readily at the north and south magnetic poles. The three authors measured the energy-distribution of the rays. Then they compared their findings with the results which would be anticipated if the rays were created in interstellar space by the annihilation of the very sparsely distributed atoms there. The observations and predictions agreed very well. Hence it is reasonable to consider Millikan, Neher and Pickering's assumption as a good working hypothesis concerning the origin of cosmic rays, which are therefore the only observable relics of the annihilation process. What initiates this transformation of energy, and in what form it travels to the earth, were in 1943 unsolved problems.

Thermal Diffusion.—The law of force between two molecules

cannot be written down in exact mathematical form. Certain facts concerning intermolecular forces are, however, obvious. The magnitude of the force decreases with increasing separation of the particles, provided they are more than a certain distance apart. Molecules also resist very strongly any attempt to bring them closer than a certain distance, as may be deduced from the difficulty of compressing to smaller bulk such a substance as water. In treating the behaviour of molecules by mathematical arguments it is therefore necessary to use plausible approximations, which are usually in the form of inverse power laws. Certain molecules, which behave somewhat like hard elastic spheres, are classed as "hard" molecules; others, in which a repulsive force builds up gradually as the molecules approach, are termed "soft" molecules. The theory was in 1943 still far from rigorous, but was reliable enough to be used as a guide in interpreting the results of thermal diffusion experiments. W. W. Watson and D. Woernley enclosed a mixture of ordinary and heavy ammonia in two glass bulbs connected by a long narrow tube. After keeping one hotter than the other for some hours, a greater concentration of the heavy component was found in one bulb, in agreement with the general predictions of the theory. After repeating the experiment in various temperature ranges it was possible to find out how the separation of the components of the gaseous mixture was affected by temperature. Here a new observation was made. A reversal in the direction of separation occurred at about 20° C., which means that if one bulb were held at 100° C. and the other at −60° C., no separation would occur by thermal diffusion. A similar result was recorded in 1942 for neon-ammonia mixtures. The cause of this puzzling behaviour can be found in the lack of spherical symmetry of the ammonia molecule. Indeed, the method is a promising one for investigating long-range molecular forces.

Cerenkov Radiation.—A new radiation accompanying the passage of very fast electrons through transparent materials was found by the Russian physicist Cerenkov in 1934. After the first announcement several papers were published dealing with the dependence of its properties on electron velocity and on the refractive index of the medium. Cerenkov radiation cannot be produced unless electrons move with a velocity greater than that of light in the transparent medium. In the words of J. E. Henderson, the radiation may be regarded as the electromagnetic bow wave of an electron, analogous to the bow wave of a boat which moves faster than the waves which it sets up on the surface of the water. Like the bow wave of a boat, Cerenkov radiation travels and can be observed only in certain directions with respect to the moving electron; in all other directions it is destroyed by interference. The direction of emission is connected with speed of the electron and the refractive index of the medium by a simple relation which was verified by the experiments of H. O. Wyckoff and J. E. Henderson in 1943 and of G. B. Collins and V. C. Reiling in 1938.

Electron Microscopy.—In the standard type of electron microscope, only objects suitable for forming into or being mounted upon extremely thin films can be investigated directly. The surface of a solid cannot, therefore, be examined unless a replica of the surface is first made on a thin film. A film of the metal itself cannot be used because it has properties quite different from those of the same metal in bulk. A new technique developed by R. D. Heidenreich and V. G. Peck promised to be very useful. The process is a two-stage one. First, plastic polystyrene is moulded on to the metal surface and squeezed in a press. Then the excess metal is cut and dissolved away, leaving a negative imprint of the metal's surface on the plastic. Next, the plastic is mounted in a vacuum above a small heating coil from which silica is quickly evaporated on to the cold polystyrene. Silica molecules are extremely mobile on polystyrene, so they penetrate into little crevices and cover the surface completely. The silica film is removed from the plastic by dissolving the latter away. It is then ready for mounting on a frame for insertion in the microscope.

In this series of processes, some detail is inevitably lost, but the final resolution obtainable with such replicas is between 150A and 200A, surpassing that of an optical microscope some twenty-fold. So many problems of surface structure await solution in this range that a new electron microscope was designed expressly for the task. The first model was built by C. H. Bachman and S. Ramo. In this instrument extremely high resolving power was consciously sacrificed for simplicity, compactness and mobility. It operated entirely on electrostatic principles and needed none of the precise current and voltage regulation required for an electron microscope with magnetic lenses. An image is first formed by an electron beam on a fluorescent screen, which is then photographed through a good optical microscope. The magnification due directly to the electron beam is therefore comparatively small, but the intermediate image possesses the high resolution necessary for further enlargement by the optical system.

New High-pressure Cloud Chamber.—One of the most direct ways of investigating the behaviour of charged particles is to photograph the tracks of ions which they leave in their wake as they traverse a cloud chamber. In the case of cosmic rays, in which interesting events occur only rarely, the accumulation of useful data by a cloud chamber operated at atmospheric pressure is a wearisome undertaking. A few high-pressure chambers have, indeed, been built, and their good performance has suggested that it would be advantageous to have chambers which could operate at several hundred atmospheres. The chief problem of design was solved by T. H. Johnson, S. DeBenedetti and R. P. Shutt of the Bartol Research foundation, who enclosed their new chamber completely in a bath of transparent oil, contained in a 5-ton steel casting strong enough to withstand the large forces involved. In this way the pressures inside and outside the chamber itself are nearly equal. Photographs are made through a small window in the casting and expansion is effected by releasing a little of the surrounding oil. Already photographs had been made between 100 and 200 atmospheres in argon. One such picture showed at once all that happens in the atmosphere over a vertical area of some 20,000 sq. ft. Furthermore, a chamber operated at such high pressure has a sensitive period much longer than that of a low-pressure chamber. The harvest of information per picture is, of course, proportional to the pressure and to the time of sensitivity. With this important new instrument, data concerning rare events such as mesotron disintegration might be expected rapidly. (*See* also X-RAYS.)

BIBLIOGRAPHY.—The reader who desires fuller information on physics in 1943 will do well to look up the topics mentioned here in the index to vol. 63 and 64 of the *Physical Review*, whence he will be led to original papers in that and in other journals. (T. H. O.)

Physiology.

Thyroid Gland.—Interest was aroused in a possible new treatment for hyperthyroidism by the observation that certain sulfonamides as well as thiourea and its derivatives lowered the basal metabolic rate when fed to rats for several weeks. A large number of compounds were tested and it was found that a substance called "thiouracil" was most effective in decreasing metabolism. This substance was subsequently tried clinically on a number of patients with hyperthyroidism. The preliminary results were encouraging but more extensive studies are necessary before a final evaluation of the drug can be given. In regard to the mechanism of action of thiouracil, the evidence indicated that it prevented the thyroid gland from utilizing iodine in the synthesis of the thyroid hormone; thiouracil

did not interfere with the action of the thyroid hormone when the latter was given in a preformed state.

Vitamins.—One of the toxic manifestations of the sulfonamide drugs is the occurrence of anaemia and leucopenia (a reduction in the number of white blood cells). Recent work has indicated that one of the members of the vitamin B complex may be useful in preventing these effects. This substance, folic acid, was discovered in 1941. It was shown that the administration of this compound cures the anaemia and leucopenia produced in rats by the administration of sulfonamide drugs.

Evidence was obtained indicating that vitamin B_1 (thiamine) is synthesized by bacterial action in the human intestinal tract. This was known to occur in certain other animal species but it had not yet been demonstrated in man. An interesting and perhaps clinically important observation was the fact that certain sulfonamide drugs employed in the treatment of intestinal disorders (succinylsulfathiazol) prevented this intestinal synthesis from occurring. (*See* also VITAMINS.)

Gastrointestinal Tract.—It was known for some time that extracts of the upper intestinal mucosa contained a substance called enterogastrone which inhibits gastric secretion and motility. The possibility that patients might be "immunized" against the recurrence of peptic ulcer by injections of enterogastrone received some encouraging support during 1943. The development of gastrojejunal ulcer in Mann-Williamson dogs was prevented for one year by enterogastrone injections. In the Mann-Williamson operation, a gastrojejunostomy is performed and the alkaline bile and pancreatic juice is diverted into the terminal ileum; this allows unbuffered and gastric juice to come in contact with the jejunal mucosa. Ninety-eight per cent of these animals die with ulcer within one to nine months if untreated. After preventing ulcer in these animals for a period of a year, the enterogastrone injections were discontinued. In spite of this, however, ulcer failed to develop in these dogs even after a period of a year without treatment. This was a surprising result because in previous work with aluminum phosphate and gastric mucin, ulcer developed within one to four months after treatment was stopped. The mechanism of this enterogastrone "immunization" is not clear. It is not due to a markedly reduced secretion of acid or pepsin by the gastric glands. It may be due to an increased resistance of the jejunal mucosa to irritation.

The effect of coffee and caffeine on gastric secretion was studied. It was found that these substances stimulate gastric secretion in the cat and in man but not in the dog. In the cat, acute and chronic ulcers of the stomach and duodenum could be produced by the daily administration of five grains of caffeine. On a body weight basis, this would correspond to 30 to 60 grains for man (a cup of coffee contains about one and one-half grains of caffeine). Thus if the human stomach behaves like the cat's stomach, abuse of coffee or other caffeine containing beverages may be a direct cause of ulcer in susceptible subjects. In man, caffeine and alcohol manifest a synergistic stimulation to gastric secretion.

Thus the practice of drinking coffee in relation to alcoholic beverages places the stomach and duodenum of the person susceptible to peptic ulcer under considerable strain.

Environmental Stress.—In World War II men were frequently exposed to extremes of heat and cold and were often forced to exist for prolonged periods without adequate sources of food or water. During 1943 intensive studies were carried out in the Mojave desert in California with regard to the water requirements of men under conditions of extreme heat. The water requirements were found to depend upon the amount of body activity and the daily temperature. At 95° F., a man required at least three quarts of fluid a day, and one who worked hard in the sun needed as much as seven quarts. At 110° F., six quarts were required at rest and as much as 10 to 12 quarts in 24 hours were needed by men doing strenuous work in the sun. When the water supply was limited, it was found that more than twice as much work could be accomplished by men working only during the coolest part of the 24 hours (*i.e.*, at night) than by those who worked during the day when the heat was most intense.

Other studies were made upon men adrift at sea in rubber life rafts. Some of the conclusions reached from this study were: (1) When water is scarce, dehydrated or heavy foods should not be eaten. (2) It was found to be advantageous to drink large quantities of water prior to being cast adrift. (3) When water became available after a period of prolonged dehydration, it was found to be better to drink as much as one could comfortably hold at once instead of drinking smaller amounts at wider intervals. (4) Keeping the clothing saturated with sea water was found to help prevent dehydration.

Pittsburgh. Tenth in population (671,659) among cities of the United States in 1940, Pittsburgh, Pa., had an area of approximately 54.3 sq.mi. at the end of 1943. It is in the southwestern part of Pennsylvania at the junction of the Monongahela and Allegheny rivers. Mayor (Jan. 1, 1944), Cornelius D. Scully.

In 1943, production at factories in the region centred in Pittsburgh, already representing near-capacity levels in 1941 and 1942, was further increased. There were completed in the region during 1943 a significant enlargement of iron and steel capacity, expansion of plants producing small war craft, and an important new unit producing materials for synthetic rubber. Accompanying the larger industrial output was a record dollar volume of retail trade.

With brisk industry and trade, utility loads in the district were heavy in 1943, but with limited interruption and delay, the loads were carried, local transportation in rush periods being relieved somewhat by more staggering of office and school hours. A new electric generating plant in the Pittsburgh area, with a capacity of 60,000 kw., was dedicated early in 1943.

Although deeply involved in war, the community took important steps in 1943 toward planning for peace. The city of Pittsburgh and the county of Allegheny, through their planning commissions and their works departments, increased their efforts in the planning of public works.

The assessed valuation of taxable real estate in Pittsburgh, for city and school taxes of 1943, was $1,044,010,664, land valuation being $471,359,772 and building valuation $572,650,892. City tax rates were 22.5 mills on land and 11.25 mills on buildings; school

rate, 11.75 mills on combined valuation. The county rate of 7.625 mills within the city related to a somewhat lower assessed value.

Expenditures and debt to the nearest dollar for the city of Pittsburgh, the Pittsburgh school district and the county of Allegheny were as follows: expenditures, except debt retirement, calendar year 1943, $18,080,774 for the city, $12,122,105 for the school district, $16,281,814 for the county; bonded debt less cash and bonds in sinking funds, end of 1943, $53,264,661 for the city, $18,010,369 for the school district, $82,485,613 for the county. It is necessary to note that only 54.8% of the county's assessed valuation of taxable real estate was in Pittsburgh. (J. G. Bo.)

Pius XII (1876–), the 262nd successor of St. Peter in the See of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned as pope on March 12. (For details of his early life, see *Encyclopædia Britannica.*) In his office as pope he is held to be the Vicar of Christ on earth, and he is the spiritual pastor over an estimated 400,000,000 Catholics in all parts of the world. These were to be found in 1943 in all the warring nations, though countless thousands were either slaughtered or died in concentration camps.

The course of the war in 1943 was brought very close to the person of the pope himself, though it was reported that His Holiness had refused to take refuge outside the war zone (*see* VATICAN CITY STATE). Among the outstanding events connected with the pope was a quotation from his peace appeal made in April in the British house of lords, and the association with papal ideals for world peace voiced by high prelates of the Church of England.

Among the many benefactions made by the pope during 1943 in the direction of war relief were: $50,000 given for the restoration of Catholic churches destroyed in air raids in Great Britain; $20,000 given for church restoration in Malta; $2,000 given for internees in the Isle of Man. Papal delegates in Finland and Rumania were ordered to distribute food and clothing to Russian prisoners of war. A version of the Gospels was published in Serbian for war prisoners.

The pope addressed a letter to Cardinal Marchetti-Selvaggiani on the bombing of Rome, July 20, 1943. On Aug. 15 he appealed to world Catholics to pray for peace, and addressed a peace appeal on the fourth anniversary of the war, Sept. 1. Dec. 8 was designated by the pope as a day of public prayers for peace throughout the Catholic world.

On March 12 the pope celebrated the fourth anniversary of his coronation. Two encyclicals were published in 1943: *Mystici Corporis,* on the Mystical Body of Christ, June 29, and *Divino Afflante Spiritu,* on the study of Holy Scripture, Sept. 30.

The Vatican *Gold Book* was published by the Vatican Polyglot Press, covering the activities of the Holy See for the years 1941–42 in the fields of diplomacy, the ministry and works of charity.

The pope presided at the opening of the academic year of the Pontifical Academy of Sciences. On Oct. 30 he broadcast in Spanish to the Peruvian National Eucharistic congress. In his pre-Lenten discourse to the clergy of Rome the pope urged them to preach Sunday observance. On his name-day, June 2, he received the respects of the cardinals in Rome, when he deplored persecutions, paid tribute by name to the Poles, and recalled his own efforts to secure peace. On June 13 the pope addressed 20,000 Italian workers on social security as the basis of harmony in society. The broadcast of the pope's midnight mass on Christmas eve was cancelled, because of the 6 P.M. curfew enforced by the German occupation forces in Rome.

In his Christmas message, broadcast to the whole world on Christmas eve, Pius XII prayed that a just peace may be celebrated in 1944. The pope called for a normal measure of power sanctions, but warned that true peace can never be a harsh imposition supported by arms alone. (*See* also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.)

(J. LAF.)

Plague, Bubonic and Pneumonic. The published reports of the first nine months of 1943 indicate that bubonic and pneumonic plague recurred in the people or rodents of Africa, Asia, South America, Oceania and the United States. Its occurrence among troops of the nations at war was not recorded but it was present in Casablanca, Dakar, Port Said, Madagascar and Hawaii, which were sites of military operations. Serious outbreaks of epidemic proportions did not occur in 1943, although there were several instances of the development of the pneumonic form of the disease among a few individuals of each of several widely separated areas.

One author attributed the decreasing frequency with which pneumonic plague assumes epidemic intensity to the infrequency of the occurrence of cough and expectoration among patients in whom the lungs become involved.

Observations continued from year to year on rats of rural areas in Hawaii made it apparent that infection occurs and recurs in a rather circumscribed area, while similar observations among

POPE PIUS XII exhorting a multitude of Romans after the second U.S. air raid on Rome Aug. 13, 1943

field rodents in continental United States suggested that there is a gradual easterly extension of the disease toward the Great Plains section. These deductions seemed to be strengthened by experiences of 1943 during which an active epizootic recurred within an area of approximately 30 sq.mi. on the island of Hawaii, and the disease was found for the first time in areas of the eastern third of the states of Montana, Wyoming, Colorado and New Mexico which had been surveyed during previous years by the same procedures.

The continued studies on the role of fleas in the spread of the disease among rodents confirm the wide dissemination of the Indian rat flea (*Xenopsylla cheopis*) in the world; the identification of eight flea species in Canada which are probable vectors; and the experimental determination that two species which are prevalent in rural areas of central United States have a capacity as vectors equal to that of the Indian rat flea.

Tests were made on the Indian rat flea and on *Diamanus montanus*, which is common to the California ground squirrel (*Citellus beecheyi beecheyi*), to determine the probable number of plague bacteria (*Pasteurella pestis*) which would be ingested by a flea under favourable circumstances. An average of 3×10^5 organisms were obtained from specimens of such species shortly after feeding on an infected mouse; and it was also observed that an average of 200 organisms were expelled in their faeces during subsequent periods of 24 hr.

Technical investigations of the biochemical requirements of the plague bacterium suggested that its sources of nitrogen may be supplied by inorganic salts. The confirmation of this conclusion might result in simplification of the procedures used in detecting the organism.

A re-examination of the use of carbon bisulphide in the control of rodents when introduced into their burrows as a spray confirmed its lethal effect on the animal but indicated that its fleas were not killed.

Plastics Industry.

The second year of war shifted the plastics industry around in such an amazing manner as to actually portend the ushering in of the "Plastic Age." In 1942, plastics played an emergency role in substituting for and replacing the strategic metals and rubber. The war job performed was so excellent, the conversions so numerous, that many plastics also became critical materials, available only for war usage. This affected such synthetic resins and plastics as phenolics, vinyls, styrenes, acrylics and ethyl cellulose.

Total U.S. production of synthetic resins and plastics during 1942 was about 426,731,106 lb., or more than 213,000 tons. Figures for 1943 production were not available, but it could be presumed that plastics production more than held its own despite curtailment of consumer goods. Considering the new capacity brought in for the production of phenol and styrene, just to mention two resins, it was estimated that 1943 production was close to 600,000,000 lb.

PLASTIC ROPE, braided with strong filaments of Saran, was applied to many marine and wartime uses in 1943

Phenol formaldehyde plastics were perhaps the most widely used in war production. They were lightweight, stable under rapid temperature changes, good insulators, impervious to weathering and had high impact resistance. In planes, phenolic materials were fabricated into pulleys, fairleads, for control cables which pass to every part of the structure, cabin air controls, propeller parts and propellers themselves, aileron control quadrants, illuminated dials and name plates for night flying. These same materials saw active service on the sea as well. A warship in 1943 was a veritable electric power plant with everything operated electrically—elevators, gun turrets, gun light switches, radios, pumps, junction boxes, etc. In all such assemblies, the plastic played an important part, and had to function precisely and without failure.

The need for moulding materials of exceptional mechanical strength to replace strategic metals greatly stimulated the use and further development of compounds known as high or medium impact phenolics. Plastic of this type successfully passed the test for 37 mm. dummy fuses, and for the 75 mm. mortar shell fuse. In the Browning machine gun it replaced the black walnut used for grip handles. Booster tubes for demolition bombs were made of phenolics. And even the traditional duck from which army tents had been made was treated with phenolic formaldehyde resins, which not only increased the life of the duck material, but improved its water permeability and protected the fire-resistant finish against weathering or deterioration in storage. Melamine resins, which were but recently perfected, were used for buttons which withstood the gruelling tests prescribed by the quartermaster corps. Previously all buttons were made from imported vegetable ivory. Melamine resin was also the basis of a new treatment for paper pulp, and imparted extraordinary strength to sheets made from it, and at the same time increased the resistance of the sheet to folding. This new paper lent itself to such unusual uses as clothing, army tents, sandbags, etc. It also was experimented with in the food field, where it was used

for crate liners, for locker bags, for frozen foods, etc.

The two years of war witnessed a vast increase in the manufacturing of acrylic plastics, as well as the expansion of the facilities for fabricating aircraft parts. The aircraft industry continued to use a large percentage of the sheet production, turning out more planes per month and using a larger area of acrylics per plane. New developments included an acrylic power turret which could be revolved mechanically to aim multiple machine guns. The new bombers also carried another acrylic innovation, a gunner enclosure practically in the tail of the plane.

Acrylics saw active service in all phases of the war. Even blackout lights on army trucks and jeeps were made from acrylics. Tank sight windows were cut from sheet acrylics. Navy PT boats had acrylic machine-gun housings, as well as acrylic windows. Sea-going dials and gauges were protected from the effects of salt water by moulded or fabricated acrylic covers.

In the report issued by the Baruch committee on the rubber situation, it was stated that vinyl resins, as a substitute, saved the equivalent of 22,000 tons of crude rubber per year. Despite great increases in vinyl production capacity, there was not enough in 1943 to satisfy military needs.

Wartime applications for polyvinyl compounds increased faster than they could be made. Polyvinyl butyral, long used only as the plastic sandwich for laminated safety glass in automobiles, coated the fabric from which lightweight raincoats were made for soldiers. Polyvinyl alcohol was moulded into heat-resisting tubing and gaskets for trucks. Polyvinyl acetate was used instead of rubber latex in mid-soles for shoes. Polyvinyl chloride was used in making degaussing cables to protect ships against magnetic mines and for general use for insulation for primary and secondary cables for army as well as navy aircraft.

In replacing natural rubber in army raincoats, polyvinyl butyral saved 1¼ lb. of crude rubber in each raincoat. It was also used in bags for transporting drinking water to thirsty soldiers, hospital sheeting for military and civilian use, life belts for the navy and merchant marine, food bags and waterproof, oil-resistant suits for seamen. In extruded form, polyvinyl butyral replaced rubber in tubing, in clamps to prevent vibration of fuel lines on aeroplanes, and in a host of other military applications.

Cellulosic materials were extensively employed in gas mask parts including lenses, knobs, starter buttons, blackout lenses and protective surfaces for maps and documents. Cellulose acetate sheeting found a large war use in windows for trainer aeroplanes, for gliders, and for windshields for motorcycles. Fluorescent cellulose acetate sheeting was used for lighting fixtures in war equipment, where visible lighting could not be used. Cellulose acetate and cellulose acetate butyrate moulding powders were becoming more and more important in the manufacture of war and essential civilian materials. The butyrate and the high acetic acid content cellulosic plastics were being used for applications requiring improved water resistance and dimensional stability. Among such uses were gas mask lenses, hose nozzles, pistol grips, flashlight cases, first aid kits, stirrup pump parts, shaving brush handles. The mechanical strength and ease of moulding these products made them extremely valuable as substitutes for metal, rubber and glass, and as materials for construction of articles for which metal and rubber are not satisfactory.

One of the best known of all plastic materials was polystyrene, even though it was relatively new in the United States. During 1943 productive capacity for the manufacturing of monomeric styrene for polymerization into the plastic was a fortuitous circumstance, since this product was available for the manufacturing of the Buna-S type of rubber. This further demonstrated one of the many contributions the plastics industry made to the war effort. Petroleum and coal are the raw materials from which styrene is made, which is further polymerized to make polystyrene. Its most remarkable characteristic is extreme resistance to chemical attack. For example, hydrochloric acid which will dissolve glass has no effect on polystyrene. It absorbs practically no moisture and is an excellent insulator, a sheet of one-thousandth of an inch thick resisting up to 3,000 volts. In war it was applied to battery boxes, radio insulations, coaxial cable insulation, resin modifiers for wire coating, etc.

Ethyl cellulose was designed originally for peacetime applications. Its outstanding properties are water resistance, toughness, high impact, dimensional stability, low density and general resistance to weathering. It was in 1943 under strict allocation by WPB because of its adaptation to military use, the chief of which was as a fabric coating for braided ignition cable, fire- and water-proofing dyes, artificial leather, etc. In sheeting form it made transparent face shields for gas masks, goggles, envelopes for shop prints, and recording surfaces for airport and general communication monitors. One development was ethyl rubber made of ethyl cellulose combined with an oil plasticizer. It is flexible, has elastic properties, and shows better resistance to abrasion, ozones and to gasoline than natural rubber, but less resilience, elongation or resistance to permanent deformation. It could be used instead of natural rubber for gun covers, electrical or junction tape, water tubing to replace brass, raincoats, hospital sheeting, gloves, footwear, etc.

The chief reason for the early failure of wood parts in aircraft construction was due to the inferiority of animal and vegetable glues which had very poor resistance to water, as well as being subjected to fungus growth. These factors weakened the structure to such a degree as to destroy its value entirely. The development of synthetic resin adhesives which offered excellent bonding characteristics and complete resistance to moisture and fungus growth opened a new and entirely successful field to use in aeroplane parts.

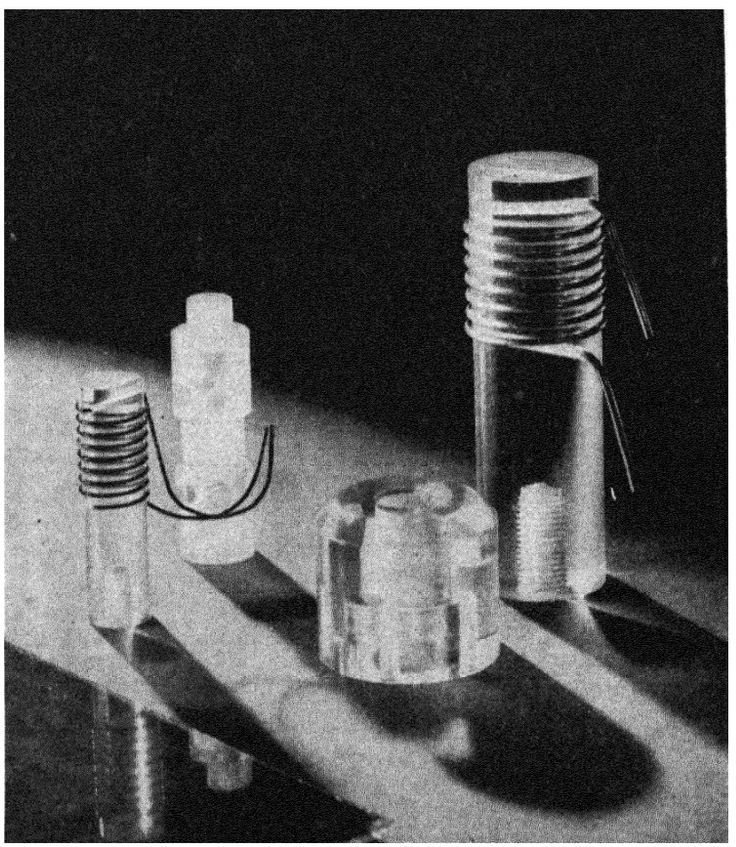
Plastic plywood in 1943 was becoming increasingly important as a major structural material for war use, and low pressure moulding methods were being used for speedy, efficient low cost production of lightweight training planes, assault boats, floating ramps, pontoons, and for the PT motor torpedo boats. All of these were fabricated of lightweight resin bonded plywood which filled the gap of a serious aluminum shortage. Pilot seats of plastic plywood were an important recent development. These seats were made of a phenolic impregnated fabric composition, as were the helmet liners used by the armed forces.

Since their introduction in 1940, the vinylidene chloride resins (Saran) aroused considerable interest, because of their unusual properties—water, chemical and solvent resistance combined with toughness, durability and appearance. It was in 1943 finding its way into such varied end products as piping for use in plumbing fixtures, to replace brass and copper in defense housing, for electric fixtures and installations. And such was the versatility of plastic material, that it could be extruded into fibres or monofilaments to be woven into a wide variety of upholstery fabrics, these fabrics magically endowed with endless resistance to weather, dirt and abrasives, and even to fire, wonderfully strong, resilient and brightly hued. It replaced rattan in subway seats, and was expected to be used in restaurants, theatres and hotels, and the interiors of tomorrow.

The safeguards of censorship prevent extensive descriptions of many of the wartime arrivals in the materials field. But a brief survey of some of these newcomers may be offered:

Synthetic replacements for natural mica—one of the most critical war materials because it is a vital component of radio and electrical apparatus—were being developed by several companies. One of these produced a series of commercial products called Polectron. Polectron was said to have an unusual combination of low dielectric loss, high temperature stability and superior water resistance, although the mechanical strength of the resin made in 1943 was still relatively poor. Immediate uses for the material, such as dielectric sheets in condensers, did not call for a high degree of mechanical strength.

An inorganic mineral element, silica, was combined with organic radicals composed of carbon and hydrogen to produce a new group of plastics called Silicones. Silicones are said to be resistant to temperatures as high as 500° F., which suggests their suitability for use in electrical insulation where such conditions may be encountered.



Another new material, as yet a little-known name on the plastics roster, was Penacolite. This was said to be a phenolic-type thermosetting resin which cures rapidly at temperatures from 60° to 150° F. under nearly neutral conditions. This type of resin might eliminate many of the difficulties in assembly gluing of wood or plastic-plywood parts for use continuously exposed to the weather.

Polystyrene fulfilled many difficult assignments in wartime electronic and aircraft equipment. Styraloy, a recently developed elastomeric styrene derivative, was reported to have properties which made it eminently suitable for electrical applications at both high and low temperatures.

A long-awaited entry in the plastics field was an adhesive which would permit the bonding together of metal, wood, plastics, ceramics, fibres and rubber in any desired combination. A possible solution to this problem was found in Cycleweld and Reanite cements, thermosetting plastics which were applied to the surfaces of the units to be bonded and then cured under heat and pressure.

This process was said to form structures which were stronger, lighter and cheaper than those joined by conventional methods.

Reinforced plastics which permitted large-volume production of low-cost, lightweight, high-strength structures offered many advantages beyond the replacement of critical aluminum and magnesium. Several new resins which would form satisfactory bonds at low or contact pressures and thus eliminate the need for costly dies were created, and special papers, cotton and rayon fabrics, and glass fibre cloths were developed as reinforcing materials. These low-pressure laminated plastics attracted interest because they made possible the fabrication of huge structures heretofore considered impractical

RADIO INSULATORS and coil forms of Lucite, for military high-frequency equipment

and even impossible for plastics.

Resin-impregnated wood became an important factor in maintaining an adequate supply of propellers for the expanding air forces. A plant with facilities for producing 50 times the volume of Pregwood available prior to the war, was in operation. The resin-impregnated and compressed maple boards were bonded by means of electrostatic high-frequency heating of thermosetting phenolic glues into blocks from which the propeller is carved. Other applications of this wood-plastic material included electrical insulation, bearing plates, skis and ventilating fans.

A new rubber-like product, Paracon, made by the condensation of dibasic acids with glycols or by the condensation of hydroxy acids was announced. The elongation at break of these polyesters was said to average 400% with an average tensile strength of about 1,700 lb. per square inch. Important progress was also made in the production and application of polyethylene and its derivatives, but the publications on the subject were limited to the patent literature.

Platinum. No information was received on platinum production, except that the chief producer in Colombia reported the recovery of 17,603 oz. of crude in the first three-quarters of 1943. The Canadian nickel output was maintained, and unless there was some difficulty to hold up recovery and refining of the platinum slimes from the nickel refinery, platinum output should keep up as well. However, some decrease in supply, accompanied by increased demand in electronics and the manufacture of fibre glass during the last half of 1943 disturbed the former balance between supply and demand, and platinum was moved to the head of the list of metals short in supply. Steps were taken to improve scrap and inventory control provisions, and unless the situation showed prompt improvement, allocation would be required. In December it was reported that the supply had improved somewhat, but that the position was still uncertain. (G. A. RO.)

Plums and Prunes. The total fresh basis production of plums and prunes in 1943 was estimated by the U.S. department of agriculture to be 682,000 tons in the commercial producing states which was 10% above that of 1942 but 3% below the 10-year (1932–41) average. California produced 68,000 tons of plums compared to 72,000 tons in 1942 and Michigan 3,400 tons against 5,300. The dried prune crop of California, Oregon and Michigan, where most of the crop is growing, was 206,100 tons in 1943 (dry basis) compared with 177,100 tons in 1942 and a 10-year average of 215,320 tons. There was an increase of drying in each state. The tonnage of Oregon and Michigan prunes canned and cold packed increased greatly and was estimated at 47,800 tons or 95% more than in 1942. Of this total about 10,000 tons were cold packed. Smaller quantities were marketed fresh, particularly in Idaho where production for fresh use was only 3,900 tons in 1943 compared with 18,900 tons in 1942. (J. C. Ms.)

Table I.—*U.S. Production of Prunes in Tons, by States, 1943 and 1942*

State	1943 (fresh basis)	1942 (fresh basis)
Western Oregon	94,800	55,000
Eastern Oregon	10,200	15,500
Eastern Washington	12,600	17,200
Western Washington	11,600	7,400
Idaho	3,900	18,200

Table II.—*Quantities of Prunes Used Fresh, Canned and Dried,* in Tons*

State	1943	1942
Used fresh (fresh basis)		
Oregon	18,400	19,600
Washington	10,800	16,400
Idaho	3,900	18,900
Canned (fresh basis)		
Oregon	38,500	18,700
Washington	9,300	5,800
Dried (dry basis†)		
California	191,000	171,000
Oregon	14,000	6,000
Washington	1,600	100

*Includes quantities sold and used on the farm for household consumption.
†The drying rate in Oregon and Washington ranges from 3 to 4 lb. of fresh fruit to 1 lb. of dried; in California, 2½ lb. fresh fruit to 1 lb. dried.

Pneumonia. During the early months of 1943 there was a much sharper rise in the death rate from pneumonia than in previous years. This was observed among civilians as well as in army camps. Most of the increase was probably accounted for by the greater number of cases of so-called "primary atypical pneumonias" of unknown aetiology, which were presumably caused by viruses. The case fatality rate in this group remained low, but those who died of this disease were young and middle-aged adults as compared with the older age groups of the fatal cases of the usual bacterial pneumonias.

While complications of these atypical pneumonias continued to be infrequent as compared with those observed in cases of bacterial pneumonia, certain severe complications were encountered. These involved, predominantly, the nervous system and the heart and its linings. Bacterial superinfections, formerly thought not to be a feature of this disease, were also observed quite frequently.

Measles epidemics occurred in the army camps just as they did during World War I. In World War II, however, fatalities were rare, whereas in World War I the mortality from measles was next only to that from influenza. In both of these diseases deaths were due chiefly to the complicating pneumonias. The low fatality rate might well be ascribed to the widespread use of the sulfonamide drugs. They not only cured most of the complicating bacterial pneumonias but probably also cut down the chances of a spread of the virulent bacteria to other susceptibles. Thus the possibility of secondary pneumonias in the cases of measles was markedly reduced.

No specific treatment was found for the primary atypical pneumonias. In the bacterial pneumonias sulfadiazine continued to be the drug of choice. Some new derivatives and closely related compounds of sulfadiazine having similar activity and efficacy were released during the year. The most important of these were sulfamerazine which is a monomethyl derivative of sulfadiazine, and sulfapyrazine which has the closely related pyrazine substitute for the pyrimidine of sulfadiazine. Penicillin proved more effective than the sulfonamides chiefly in infection with the staphylococcus. This orgânism played an increasingly important role in the aetiology of pneumonias, particularly those secondary to virus diseases and to other serious conditions. Penicillin also proved effective against pneumococci which are resistant to sulfonamide action. The use of this drug remained in the experimental stage.

Laboratory investigators came forth with a number of new viruses which they considered as possible aetiological agents of the primary atypical pneumonias. In every instance, however, the evidence for the causal relationship was not complete. Furthermore, the viruses described by the various observers differed fundamentally from one another. The viruses of pigeons (ornithosis) and of parrots and other exotic birds (psittacosis) proved to be related to the prevalent "virus" pneumonias in only a small minority of the cases (10% to 25% in the experience of different observers).

Of interest was the discovery that most of the cases of primary atypical pneumonia developed a peculiar property in the blood known as "cold agglutinins." Their blood serum causes their own red blood cells, as well as those of other blood groups and of other animals, to clump in the cold and the clumps break up at body temperature. This property is a rare one and was described in a number of other conditions but the only disease with which it was described as occurring with great regularity is trypanosomiasis. In the latter disease a specific parasite is found in the blood

and the central nervous system. (*See* also CHEMOTHERAPY.)

Poland. A republic in northeastern Europe, invaded by the Germans and partitioned by Germany and the U.S.S.R. in 1939; the whole of Poland was conquered by Germany in 1941 after the outbreak of the German-Russian war. Area (Sept. 1, 1939) *c.* 150,820 sq.mi.; pop. (official est. Jan. 1, 1939, including Teschen) 35,100,000. Capital: Cracow (259,000). Other chief cities: Warsaw (1,289,000); Lodz (672,000), Lwow (318,000); Poznan (272,000); Vilna (209,000). Prime minister: Stanislaw Mikolajczyk (from July 1943).

History.—The year 1943 was marked for Poland by two dramatic events: the rupture of Polish-soviet diplomatic relations and the death of General Wladislaw Sikorski, Polish prime minister and commander-in-chief, in an air crash at Gibraltar on July 4.

On April 25, in Moscow, Vyacheslav Molotov, Russian commissar for foreign affairs, handed to Tadeusz Romer, the Polish ambassador, a note stating that "the soviet government has decided to sever relations with the Polish government." Although the immediate cause for the severing of diplomatic relations was described in Molotov's note as the "entirely abnormal" behaviour of the Polish government in connection with the German "discovery" of a mass grave of Polish officers in the Katyn forest near Smolensk, the crisis had been steadily growing for more than a year, owing to the difficulties encountered in the implementation of the provisions of the 1941 treaty. The prisoners and deportees release of whom had been agreed upon under the treaty were freed, but the Polish authorities claimed to be unable to trace 8,300 officers taken prisoner after Sept. 17, 1939. At the same time the soviet authorities began to raise the question of the citizenship of the deportees. The final stage in prolonged discussions and correspondence was a soviet note of Jan. 16, 1943, stating that henceforth all the deportees would be considered as soviet citizens.

THE TREK OF POLISH REFUGEES from the U.S.S.R. into Iran continued in 1943—the fourth year of their exile

The crisis created by the dispute over citizenship did not facilitate the organization of the Polish army in Russia, which also had been agreed upon under the 1941 treaty. Seventy-five thousand of the men already recruited had been sent to Iran in two groups, in March and Aug. 1942. In March 1943 a "Union of Polish Patriots" was formed in Moscow under the chairmanship of Mme. Wanda Wasilewska, a Polish communist, who started to publish a weekly called *Wolna Polska* (*Free Poland*) to express "the genuine opinion of the Polish people."

When, on April 12, 1943 the Germans announced their Katyn forest "discovery," the Polish government thought that an investigation by the International Red Cross would deprive them of any political advantages they had hoped to gain by playing up their "discovery"; for on April 15 the Russians had announced that the Polish officers, who had been in a labour camp near Smolensk, had fallen into the hands of the Germans and been put to death. Following the Polish government's request to the International Red Cross at Geneva the U.S.S.R. broke off relations with Poland. A few days later, on May 9, Moscow radio announced that the council of people's commissars had acceded to the request made by the union of Polish patriots to form a Polish division.

Following General Sikorski's death a new Polish government was formed on July 14, 1943, with 12 ministers. The new government was representative of the Polish nation, for the four parties represented in it commanded the vast majority of votes and controlled the underground movement in Poland. The new commander-in-chief of the Polish forces (in Britain, the middle east and the Polish underground army) was General Kazimierz Sosnkowski. (K. SM.)

In Dec. 1943 the U.S.S.R. and Czechoslovakia formed a defensive alliance, pledging mutual assistance in the event of any further German drive to the east and leaving the way open for the admission to the pact of any third power bordering on either country and representing an object of German aggression. This clause presumably referred to Poland. The Polish government-in-exile, however, professed disinterest unless Russia would agree to guarantee Poland's pre-1939 eastern boundary, which included in Poland the western portions of White Russia and the Ukraine. On Jan. 11, 1944, Russia announced it would annex the whole of these two territories, declaring that the disputed territory would thenceforth be apportioned to the country by whose nationals it was predominantly populated. This, Russia alleged, would set Poland's eastern border approximately at the so-called Curzon line, established after World War I. The soviet government at the same time offered to help Poland make up the loss of territory on the east by assisting her to regain territory on the west, including a corridor to the Baltic sea, and invited Poland to become a party to the Czech-soviet treaty. (X.)

The Underground Front.—The resistance of the Polish nation to the invader continued to be a total one. The Polish government in London had its own delegate in Poland, working in conjunction with the political representatives of the four main political parties, whose leaders were members of Mikolajczyk's government. A declaration dated Aug. 15, 1943, addressed to the Polish prime minister, which was published in the principal Warsaw underground paper, *Rzeczpospolita Polska* (*Polish Republic*), recommended to the members of the London government "full national solidarity" and collaboration with the Allies.

In a statement issued in London on Nov. 22, 1943, Ignacy

Schwarzbart, Jewish member of the Polish national council, revealed that the population of the Warsaw ghetto—already reduced in 1942 from 350,000 to 120,000 by deportations and mass slaughter—was completely liquidated in the spring of 1943. A similar fate befell the Jews in ghettoes in other towns in Poland.

The Struggle Outside Poland.—The Polish minister of defense announced in a report of Aug. 1943 that the Poles had nearly 80,000 fully equipped and trained troops in the middle east, under the command of Lt.-General Wladyslaw Anders. They were part of the second army organized by Poles in exile, the rest being in the British Isles. Polish losses in killed, wounded and prisoners since Sept. 1, 1941, had amounted to 903,000. From the summer of 1940 until the end of Sept. 1943 the Polish fighter squadrons operating from bases in Britain and the middle east shot down 605 enemy planes. (K. SM.)

Banking and Finance.—(In thousands of zlotys): revenue (est. 1939–40) 2,428,700; expenditure (est. 1939–40) 2,486,500; public debt (March 31, 1939) 5,317,800; gold reserve (Aug. 31, 1939) 443,000. Bank notes in circulation (Aug. 31, 1939) 1,928,000. Exchange rate (Aug. 1939) 1 zloty = 18.75 U.S. cents.

Trade and Communication.—Foreign trade (in thousands of zlotys): imports, merchandise (1938) 1,299,600; (Jan.-July 1939) 762,300. Exports, merchandise (1938) 1,184,400; (Jan.-July 1939) 781,500. Communications: roads (1937) 36,689 mi.; railways, main lines (1937) 11,223 mi.; shipping (July 1, 1939) 63 vessels, totalling 121,630 tons gross.

Agriculture, Mineral Production, Manufacturing. — (In short tons) (1939): wheat, 2,502,200; barley, 1,631,400; rye, 8,411,000; oats, 3,174,600; (1938) maize, 139,100; potatoes, 38,093,500; beet sugar, 426,600; coal, 42,002,000; petroleum, 558,900; pig-iron and ferro-alloys, 1,067,000; steel, 1,720,400.

Police. During 1943 the conditions of police service throughout the world were controlled in large measure by the war. In the occupied countries under axis domination, civil police were held within the firm administrative grasp of the quasi-military police authorities in Berlin. But as the Allied powers extended their dominion to all of North Africa, to the Italian islands of the Mediterranean, and to the southern half of Italy, the Allied Military Government forces took over Italian police units and placed them under direct military control.

Compulsory military service in many lands was a major factor in diverting trained police into military channels, and many were the official efforts to put an end to this gradual attrition of professional police resources. Nevertheless, as the year ended there was as yet no slackening in the transfer of men from police to military service, with strong indications that the same tendencies would continue into 1944 in so far as Germany, Great Britain and the United States were concerned.

In those Allied and axis-controlled areas which were subject to frequent aerial bombardment, police were confronted by particularly heavy burdens in clearing debris, assisting in the care of the injured, identification of large numbers of dead, and maintaining free circulation of traffic under extremely adverse conditions. Even outside of the bombardment zone, and in belligerent and neutral countries alike, there was an increasing burden imposed on police in maintaining surveillance over aliens, and accelerating the transport of motor convoys of men, equipment and supplies.

Wherever reductions in the number of trained police, or increases in the multiform tasks of law enforcement and military traffic threatened to overwhelm the regular police establishments, recourse was had to the use of untrained and part-time auxiliaries. Comprehensive data on these developments are available only for the United States. There an inquiry in cities over 25,000 population indicated a personnel turnover during the 18 months preceding June 30, 1943, that ranged in specific forces from 5.7% to 60.0%. The median was 22.9%. Despite such major shifts in personnel, these cities averaged 1.77 police employees per 1,000 inhabitants, a reduction of only 3.1% in police strength from the preceding year. The conclusion seems inescapable that there had been much police recruiting during 1943, which had undoubtedly been accompanied by a decline in the quality of police personnel.

In addition, auxiliary police had been increased 10% by April 30, 1943, when they outnumbered regular police in a ratio of 2.03 to 1. Most of these were enrolled as air-raid defense workers, though generally available for any type of war emergency situation.

Comparative data on police department employees in more than 400 cities having a combined population in excess of 50,000.000 appear in Tables I and II.

Table I.—*Numerical Strength of U.S. Municipal Police Forces, 1941-43*
(Number per 1,000 inhabitants)

Population Groups of Cities	1941	1942	1943
Group I—Over 250,000	2.12	2.13	2.07
Group II—100,000 to 250,000	1.45	1.50	1.47
Group III—50,000 to 100,000	1.37	1.46	1.40

Totals	2.07	1.47	1.40	1.24	1.77

Among crimes against the person, 81.7% were cleared by arrest of the offender in 1942, while 26.5% of crimes against property were successfully handled in this fashion. Table III shows the recent record in crime clearances.

Table III.—*Per Cent of Crimes Cleared by Arrest in U.S. Cities, 1940-42*

Offenses	1940	1941	1942
Murder and non-negligent manslaughter	88.7	88.1	90.6
Negligent manslaughter	83.4	80.6	86.1
Rape	70.4	76.2	81.2
Robbery	41.8	40.4	43.3
Aggravated assault	73.7	75.0	80.5
Burglary; breaking or entering	33.1	32.0	31.5
Larceny (theft)	23.4	22.7	25.0
Auto theft	23.8	24.4	24.6

Attention is particularly directed to the generally improved record of clearances in 1942 as compared with the two preceding years. In that year, the ratio of police to population reached an all-time high in the United States.

The annual congress of the International Association of Chiefs of Police was held in Detroit in Aug. 1943. While attendance from the United States and Canada heavily predominated, there were numerous delegates from Central and South America and from the British Isles. The congress set a new high attendance record.

Chief preoccupation of the delegates was with war-connected police activities, particularly in maintaining effective liaison with

such national agencies as the Federal Bureau of Investigation (U.S.) and the provost-marshals of the several allied armies. Occupational draft deferments for police and ways and means for giving effect to police priorities in securing essential equipment also attracted much attention as did the detailed discussions of race riots in Detroit and New York city earlier in the year. (*See* also CRIME; FEDERAL BUREAU OF INVESTIGATION; KIDNAPPING; SECRET SERVICE, U.S.)

Polo. The United States Polo association, governing body of the game, suspended, following the declaration of war by the United States against Germany, Japan and Italy, all championships and nationally sponsored tournaments; these not to be resumed until the conclusion of hostilities. Polo played in the United States during 1943 was of an informal character and much of it at army posts by men in the armed forces.

Approximately 80% of the handicapped players were in the armed forces and several were reported killed, wounded in action or held as prisoners of war. During 1943 the association lost one of its officers when Lt. Commander Gouverneur Morris Carnochan, secretary and treasurer, was killed while on active duty in an aeroplane somewhere in the South Pacific.

The affairs of the association continued to be administered by F. S. von Stade as acting chairman and by W. Thorn Kissel as acting secretary-treasurer. (R. F. K.)

Portugal. A republic of western Europe, forming part of the Iberian peninsula and bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira), 35,670 sq.mi.; pop. (census Dec. 12, 1940) 7,702,000. Chief towns: Lisbon (cap. 594,300), Oporto (232,280). President: Gen. Antonio Carmona; premier in 1943: Dr. Oliveira Salazar; language: Portuguese; religion: Christian (mainly Roman Catholic).

History.—While maintaining the best of relations with the two belligerents to whom, in the words of Dr. Salazar (April 27, 1943), she was "bound by close ties of political comradeship or deep affection"—Brazil and Britain—Portugal continued to observe strict neutrality in World War II and strengthened her bonds with Spain. On Feb. 22, 1943, a new trade agreement was signed with Spain under which each country was to send the other nearly double the previous year's amount of supplies and five times the annual average amount before the Spanish Civil War. Among other international events were the inauguration of a direct telegraphic service with Argentina in March and the sending of a military, naval and air mission to the United States in April.

On Oct. 12 it was announced, in Lisbon and in London, that at the request of the British government the Portuguese government had agreed to grant Britain temporary facilities in the Azores which would provide increased protection for merchant shipping in the Atlantic, the arrangements made to include British assistance in furnishing essential material and supplies to the Portuguese armed forces and the maintenance of the Portuguese national economy. All British forces would be withdrawn from the Azores at the end of hostilities.

On April 13 was passed an important law concerning the nationalization of capital. All new public utility companies were required to be Portuguese-controlled, with a Portuguese board of directors, and 60% of the capital had to be Portuguese.

Daily life in Portugal was still difficult in 1943. Cotton shortage threatened to throw 60,000 persons out of work. Port wine exports in two years had fallen from 32,000,000 litres to 6,500,000. Meat was scarce; bread, milk and tobacco supplies were further limited; olive oil, soap and charcoal were rationed; wheat, maize, millet and potato crops were the smallest in 10 years. Smuggling and profiteering reached grave proportions. Food prices had risen by as much as 100% since 1940 and wages had increased but little. In July these conditions led to industrial disturbances which had to be severely dealt with, while the government frankly warned the country that the drought of the early summer, the worst for over a century (which also destroyed thousands of acres of forest), would mean more and more restrictions as the year went on. To help provide for the future, Portugal purchased 54,000 tons of German shipping lying in ports in Angola and Mozambique and 6,000 tons from Costa Rica.

Though the country's credit balance was rather lower than in the previous year, owing largely to heavy expenditure on armaments, the financial position as a whole was considered better. The war profits tax gave twice its expected yield and a new government loan of £10,000,000 at 2¾%, announced in May, was well taken up.

Social measures included (Feb. 20, 1943) the extension of family allowances (Aug. 13, 1942) to civil servants; the establishment of a plan for the building of new primary schools, the cost to be equally divided between state and local authorities; and an extension of the scheme established 10 years previously for the construction of state-subsidized dwellings.

A new ambassador in London, the duke of Palmella, succeeded Dr. Armindo Monteiro in 1943. (E. A. P.)

Education.—Elementary (1938–39) schools 7,962; scholars 462,854; secondary schools 42; scholars 18,242; universities 3; students 5,182.

Banking and Finance.—Revenue, ordinary (est. 1942) 2,132,900,000 escudos; expenditure, ordinary (est. 1942) 2,126,600,000 escudos; public debt (Dec. 31, 1940) 6,489,700,000 escudos; notes in circulation (April 30, 1943) 5,434,000,000 escudos; gold reserve (April 30, 1943) 1,394,000,000 escudos; exchange rate (average 1941) 1 escudo = 4.002 cents U.S.

Trade and Communication.—External trade 1942 (merchandise): imports 2,413,200,000 escudos; exports 3,859,200,000 escudos. Communications and transport (Dec. 31, 1937): roads, first and second class 8,858 mi.; railways, open to traffic, 2,187 mi.; motor vehicles licensed (Dec. 31, 1937): cars 34,442; commercial 11,410; cycles 4,536; shipping (June 30, 1939) 269,000 gross tons.

Agriculture and Other Production.—Production 1940 (in metric tons): wheat 285,100; maize 367,900; wine 5,187,000 hectolitres; coal 310,000; rye 76,100; oats 25,000; rice (1939) 71,600; barley 26,200; potatoes 616,700; olive oil 34,500; sea fisheries (excluding cod-fishing) 195,000. (*See* also PORTUGUESE COLONIAL EMPIRE.)

the Azores and Madeira. Certain essential statistics of the colonial possessions of Portugal are given in the accompanying table.

History.—At the beginning of 1943 Dr. Vieira Machado, minister for the colonies, returned to Lisbon from a seven months' tour in Angola, Mozambique and the Belgian Congo. On his return he took part in an empire week, observed throughout Portugal, to inculcate a realization of the country's imperial responsibilities, which had a special significance as being the first such observance since the unification of the empire in July 1942. On the anniversary of the Portuguese revolution (May 28) occasion was taken to pay homage to the 160 heroes of the campaigns of occupation who were still living. At the Praça do Império, the group was publicly received, and, after an address by the cardinal-patriarch of Lisbon, decorations were conferred on representative members.

As a first step towards the economic valorization of the entire colonial empire there was created in Angola a council of technical and economic co-ordination.

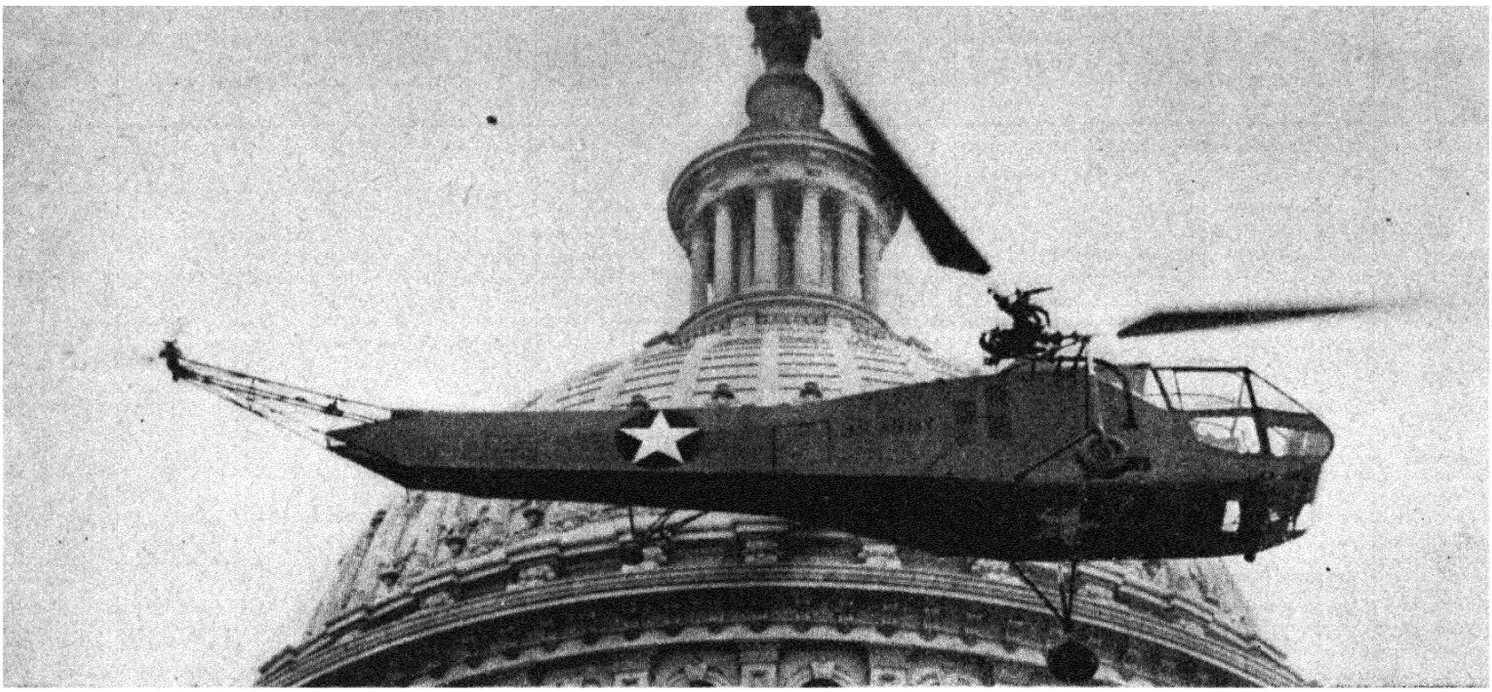
Post Office.

The audited revenues of the post office department for the fiscal year 1943, as stated in the records of the comptroller general of the United States, amounted to $966,227,288.51. This was the highest in postal history and $106,409,797.63 higher than in 1942, which was the next highest.

There were also reported to the treasury department the items stated in the act of June 9, 1930, indicating the estimated postage that would have been collected if the services had been on a regular pay basis, in the case of penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind. These amounted to $122,343,916.00.

The expenses of the department for the fiscal year as audited amounted to $952,535,379.06, of which amount $20,347,154.72 was on account of prior years. There was $32,704,513.28 to be paid on account of the 1943 fiscal year. This left a total expense for the fiscal year 1943 of $964,892,737.62, resulting in a gross operating surplus on an accrual basis of $1,334,550.89.



Effective March 27, 1942, free mail privileges were granted to members of the armed forces. It was estimated that 2,121,974,400 pieces of first-class mail were being mailed annually by U.S. soldiers and sailors. The revenue which would have been derived from this mail at the rate of 3 cents apiece would have amounted to $63,659,232.

The tremendous increase in the volume of mail handled by the post office department for other branches of the government had been a matter of concern to congress and the department for a number of years. Thousands of tons of forms, pamphlets, circulars and supplies were being sent by government departments and establishments free of postage under the "penalty privilege." Congress enacted laws prohibiting, with certain exceptions, the sending free of postage of books, reports and bulletins without a request therefor. The records disclosed that during the fiscal year 1943 there were mailed free 1,956,073,568 pieces, weighing 295,711,589 lb., an increase of 440,058,124 pieces and 59,182,574 lb. over the previous year.

The intensive bond and stamp sales program, inaugurated May 1, 1941 in co-operation with the treasury department, was greatly expanded after U.S. entry into the war. On June 30, 1943, war savings stamps were on sale at 43,680 post offices. Sales from July 1, 1942, to June 30, 1943, amounted to $537,861,246.80.

From March 1, 1935, when the United States savings bonds were placed on sale at post offices, to June 30, 1942, there were sold through the postal service 35,128,618 bonds, having a sale value of $4,309,937,575. During the fiscal year ended June 30, 1943, 41,042,540 bonds, having a sale value of $1,495,509,025 were sold. At the close of the year bonds were on sale at 21,340 post offices, including 1,200 branches and stations, a net increase of 1,384 over the preceding year.

Through its 42,680 post offices and 4,087 stations being conducted under contract agreement, as well as 1,878 classified

AS PART OF THE 25TH ANNIVERSARY CELEBRATION of regular U.S. air-mail service, this army helicopter hovered in front of the capitol at Washington, D.C., May 15, 1943

stations and branches, there were received, transported and delivered more than 33,000,000,000 pieces of mail matter during the fiscal year, having a weight of more than 3,500,000 tons, representing an increase over the previous fiscal year of more than 3,000,000,000 pieces of mail and more than 300,000 tons.

On June 30, 1943, there were 4,087 stations being conducted under contract agreement. The average cost per contract unit was $478, and the total cost of operation during the fiscal year amounted to $1,928,902, whereas the receipts from the sale of stamps at these contract stations amounted to $40,675,779 during the calendar year 1942.

During the fiscal year, city delivery service was established in 61 additional cities, thereby increasing to 3,408 the number of cities in which this service was in operation. It was extended to 14,645 blocks of territory serving 412,307 families and 7,254 new places of business.

Postmasters.—During the fiscal year there were 3,322 postmasters confirmed by the senate and appointed without term by the president. There were 2,178 presidential postmasters reappointed upon the expiration of their commissions and 400 reappointed due to advancement of their offices from the fourth class to the presidential grade, which necessitated new appointments. Of the postmasters appointed, 2,322 were due to the expiration of four-year terms, 496 to advancement of offices from the fourth class to the presidential grade, 164 to resignations, 118 to deaths, 73 to removals, 74 to retirement, 73 to transfers to other classified positions, 2 to failure of postmaster to qualify after appointment. Fourth-class postmasters were commissioned to 2,310 offices during the year as vacancies occurred through various causes.

Dead Letters.—During 1943 15,437,258 letters were impossible of delivery, an increase of more than 2.9% over the previous year. This increase reflected to some extent the increased volume of mail handled but was due more to the large number of incorrectly addressed letters for the military and naval forces and for civilians who moved incident to changes in location due to war work. A total of 2,968,510 letters was returned to the senders, of which 279,176 were found to contain valuable enclosures and 49,007 of them contained money, amounting to $115,322. A total of 12,371,296 letters was destroyed as undeliverable. Money found loose in the mails amounted to $36,943. There were also 531,484 unclaimed parcels and articles found loose in the mails. These parcels were sold at public auction and $110,292 realized.

Air Mail.—On June 30, 1943, there were 45,304 mi. of domestic air mail routes, an increase of 681 mi. over June 30, 1942. During the year two new domestic air mail routes were established.

The air mail service, established as one of the most vital postal services, owing to the need it fills in connection with the wartime demand for speed, handled a volume of mail approximating an 80% increase in pound-miles over the preceding year with about one-half the number of aircraft, a large number of the commercial transport planes having been withdrawn for transfer to the military service.

There was a large increase in the volume of mail carried by foreign air mail routes during 1943 which operated with a high percentage of performance. This was particularly true of the important air mail service to South America which was maintained to both the east and west coasts on daily schedules. At the close of the fiscal year the length of certified foreign air mail routes was 54,530 mi.

Rural Delivery.—The rural delivery routes in operation on June 30, 1943, required a total daily travel of 1,425,860 mi. by rural carriers in providing service to approximately 29,319,347 patrons. The policy of consolidation of rural routes to absorb vacancies was continued. Operation of the rural delivery service resulted in an expenditure of $91,812,942 for the fiscal year as compared with $91,634,811 for the previous year, an increase of but $178,131 over 1942. The amounts saved through consolidation of routes were utilized to establish new routes and provide extension of existing routes. Thereby 4,889 more miles were covered by rural carriers at the close of the fiscal year 1943 than in 1942. Rural delivery service was transferred from the jurisdiction of the second assistant postmaster general to the first assistant postmaster general on July 1, 1942, to co-ordinate it better with other delivery services.

Postal Savings.—The postal savings system continued to merit a widespread public demand for its services; the depositors numbered 3,064,054 for 1943, an increase of 8.93% from the preceding year. The balance due depositors represented by outstanding certificates of deposit was $1,577,409,942, an increase of $261,999,540, or about 19.96%. In addition, there was held in trust for depositors accrued interest of $45,004,355.96, and unclaimed deposits of $115,668, making a total of $1,622,529,965.96.

At the end of the year, postal savings certificates were on sale at 8,060 depositories, including 861 branches and stations; but savings stamps were on sale at all post offices and practically all branches and stations.

Buildings.—During the fiscal year ended June 30, 1943, the post office department operated 3,258 government-owned buildings. Owing to the war and the cessation of the public-building program, no new buildings were completed during the fiscal year. Through reassignments of space within these buildings, agencies of the government which were or had intended occupying commercial quarters were accommodated, with a saving of $94,743.64. Because of the war, the public building program was suspended. Expiring leases numbering 869 were renewed in 1943. Where necessary to meet increased service needs, larger quarters and superior facilities were obtained, and in other cases necessary improvements were secured in the occupied quarters. The square foot cost of renewing leases was increased from 73.8 cents in 1942 to 74.6 cents in 1943. Fifty-five new leases were made, including 35 for offices previously occupying space on a monthly rental basis, the new contracts providing improved quarters and in many instances complete new equipment. (I. Gg.)

Great Britain.—The 1943–44 budget estimate of expenditure, £110,632,000, was £8,100,000 above the 1942–43 figure; but as additional war expenditure was being met from vote of credit comparisons were difficult. The revenue estimate, £111,032,000, excluded the value of telegraph and telephone services for government departments, estimated at £17,000,000, for which cash payments ceased on March 31, 1943: this change was to save man-power. Allowing for this, the estimate showed an increase of £15,500,000 over that for 1942–43 (£13,000,000 above actual receipts). These sums excluded wireless licence revenue, which was accounted for separately, but included war surcharges which were increased in the 1943–44 budget. Commercial accounts were suspended to save work.

There was remarkable progress in every branch of savings. By Dec. 31, 1942, balances in the post office savings bank had reached a total of £1,005,431,000; investments standing at the credit of holders on the post office register £656,332,000 and National Savings certificates £966,857,000 (excluding interest).

In order to release labour for vital war work, postal deliveries and collections were further curtailed and the business reply service was suspended. Overseas surface mails were steadily maintained in spite of attacks on shipping.

The excessive use of the airgraph and air-letter services indicated that these speedy means of communicating with the armed forces and merchant navy personnel overseas were greatly appreciated.

Notwithstanding further dilution of operative and engineering staff the telephone and telegraph organizations successfully met the expanding needs of the fighting and defense services and war industry. Some restriction was unavoidable. The community was urged to be sparing in the use of both services and the popular greetings telegram facility had to be withdrawn.

The volume of postal traffic remained below the prewar level, mainly by the reduction in circular advertising, but wartime work at public counters combined with pressure in the telegraph and telephone services required additional staff, and in July 1943 the total had reached 294,000. Of the prewar total (283,000) about 71,000 (including 2,500 women) had joined the forces and 5,000 were on loan to other government departments. Temporary substitutes being mostly women, the number of women rose to 129,000. (*See* also Philately.) (S. R. C.)

Postwar Planning.

Immediately after Pearl Harbor, and during the year 1942, planning for the peace in the United States had been distinctly unpopular. But as the flood of nazi advances in the U.S.S.R. and Africa was first stopped, and then turned back, and as the hope of an Allied victory developed into a certainty, the popularity and practice of postwar planning rapidly increased. By the summer of 1943 the Office of Public Opinion Research reported that 60% of the American people favoured planning for the peace, even before victory was won; and the Twentieth Century fund listed 28 governmental and 109 private planning agencies operating on a national basis—not counting a multitude of regional and local bodies and individual commercial concerns. Their fields of interest included international and regional problems, business and finance, economic and social questions, education, agriculture, labour and law.

The amount of planning for the postwar period under way in 1943 far exceeded that which was carried on during World War I. In the previous war the planning that was done lacked any single objective. In 1943 a "full-employment" economy when the war was over was accepted by widely diverse interests as their basic aim.

The two outstanding 1943 events in the field of international governmental postwar planning were the food conference held in Hot Springs, Va., from May 18 through June 3 and the formation in November of the United Nations Relief and Rehabilitation administration (*q.v.*). The first conference of the UNRRA delegates, representing 44 nations, was held at Atlantic City toward the end of 1943, and a program of joint operations on a global scale was worked out.

In sharp contrast to the nation-wide interest of Americans in postwar planning during 1943 was the action of congress which wrecked the National Resources Planning board by cutting off its funds beginning July 1, 1943.

The senate, however, recognized the importance of postwar problems by setting up in March 1943 a special committee on postwar economic policy and planning, under the chairmanship of Senator Walter F. George of Georgia. Before the end of the year the committee had published two brief reports summarizing the activities of public and private agencies in the field and the problems with which they were dealing.

U.S. postwar planning agencies active in 1943 could be classified in three main groups: (1) government, including federal, state and city bodies; (2) private nonprofit organizations; and (3) business concerns and trade associations.

In the field of government planning the most important event in 1943 was the appointment of Bernard M. Baruch early in November as adviser on postwar adjustment to the war mobilization director. Baruch was instrumental in the formation of a Joint Contract Termination board which at the end of the year had worked out a uniform and consistent policy to be followed by government agencies in the termination of contracts. The disposal of surplus stocks and government-owned plants were among other postwar problems being studied by Baruch. The postwar planning activities of other government agencies in 1943 were, briefly, as follows:

The bureau of labour statistics studied postwar employment opportunities, the problems met after World War I in returning to a peacetime economy, the machinery and consequences of the coming demobilization and the probable postwar output of leading industries in relation to employment. The department of commerce carried forward an analysis of the possible expansion in the postwar period of markets for goods and services if the country achieves maximum employment, studied the problems of transforming war production into high-level peacetime output, and through its 13 regional branches, made special regional studies of postwar employment and profit opportunities.

The department of agriculture was engaged in building com-

plete "atlases" of agricultural information covering nine regions; estimating food requirements and possible output after the war and the general economic conditions under which agriculture would operate; formulating long-run goals for agriculture and postwar plans for the conservation and development of U.S. natural resources; planning adequate health and medical service for farm families, and studying the postwar interrelation of agriculture and industry.

The Public Roads administration developed plans with state highway departments for reconditioning and expansion of the nation's roads; the Maritime commission studied the problems and resources of American shipping after the war; the Rural Electrification administration worked on plans for postwar expansion of electric service and equipment; the National Housing agency made estimates of housing demands and resources after the war; the division of special research of the state department studied problems of postwar international economic and political reconstruction; the divisions of research and statistics of the treasury and of the Federal Reserve board worked intensively on problems of postwar finance; and the Social Security board submitted a report to congress recommending a social security program providing a bulwark against all major risks to those who work for a living.

State and municipal governments were also active in postwar planning during 1943. All the states set up planning commissions and most of the larger cities developed programs for action after the war. In the case of cities this work was largely the formulation of plans and specifications for public works. (*See* TOWN AND REGIONAL PLANNING.)

Among the private postwar planning activities of 1943 the following were especially significant:

The Committee for Economic Development (*q.v.*), a nonprofit educational institution run by and for business under the chairmanship of Paul G. Hoffman, president of the Studebaker corporation, was organized "to maximize the productive employment to be provided by business in this country" through the stimulation of postwar planning by individual companies, and through research on some of the central economic problems of the postwar period. The chamber of commerce of the United States and the National Association of Manufacturers were also active in postwar planning in 1943—the chamber through its economic policy committee and the association through its postwar problems committee—studying problems and publishing reports of their findings. On the side of labour both the American Federation of Labor and the Congress of Industrial Organizations recognized the need for postwar planning by appointing special committees to study problems of the peace.

In the commercial field most of the large companies set up special planning committees among their executives to study postwar reconversion plans, market possibilities, the development of new products and materials, etc. Many trade associations also began systematic planning activities covering their own industries.

The National Planning association and the Brookings institution were devoted to research on a wide range of postwar problems, while the Commission to Study the Organization of Peace and the Twentieth Century fund were active in the field of public education. The latter two co-operated with the National Broadcasting company in a series of coast-to-coast radio programs on postwar problems entitled "For This We Fight." Most of the leading national membership organizations—the Y.'s, the General Federation of Women's Clubs, Rotary, etc.—carried on extensive educational work on postwar issues with their members.

In addition to the work of planning itself, several agencies—including the committee on postwar economic policy and planning of the senate, the National Planning association, the Twentieth Century fund, and the United Nations Information office—studied, catalogued and classified the organizations which were doing the planning. Also libraries, including the Library of Congress and the Woodrow Wilson library, made extensive collections of postwar planning materials and functioned as central information centres. (*See* also UNITED STATES.) (E. CK.)

Potash. During World War I, consumers of potash in the United States were forced on short rations, because at that time the bulk of the supply came from Germany. Thereafter, the United States developed a domestic potash industry that put the country on a basis of self-sufficiency. After 1939, exports exceeded imports. A report prepared by the industry in 1942 estimated the probable domestic demand for the year at 577,000 short tons of contained K_2O, as against a plant capacity of 620,000 tons; as a matter of fact, production for 1942 turned out to be 679,206 tons of contained K_2O; this figure was 10% greater than the estimated plant capacity, 29% greater than the 1941 output, and 118% greater than the 1939 output.

No information was received from any of the European centres of production which normally account for almost all the world output outside of the United States. Germany nominally controlled not only the German sources, but also those of France and Poland, but it was likely that shortages of labour, materials and shipping facilities seriously handicapped operations. Nothing was known of conditions in Russia and Spain after the beginning of the war in 1939, except that the Spanish industry, which was closed by the civil war, was reopened on a small scale in 1940. (*See* also FERTILIZERS.) (G. A. RO.)

Potatoes. A record production of potatoes was harvested in 1943 because of increased acreage and yields. The acreage was increased 24%, to a total of 3,363,000 ac., as estimated by the U.S. department of agriculture, compared with 2,711,000 in 1942 and an average of 3,131,000 in the period 1932–41. The crop was estimated to be 469,092,000 bu., compared with 371,150,000 bu. in 1942 and the 10-yr. average of 363,332,000 in 1932–41. The yield was 139.5 bu. per acre in 1943, compared with 136.9 in 1942 and an average of 116.9 in 1932–41. Harvesting was completed in most areas before frost damage, except in Idaho where the late planted crop was damaged by an October freeze and about 5% of the crop was damaged so as to be a loss. As a whole the losses from frost were not serious except in a few localities.

Table I.—*U.S. Production of Potatoes by States, 1943 and 1942*

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
18 surplus late potato states			Vermont	1,825,000	1,473,000
			New Hampshire	1,472,000	1,088,000
Maine	73,485,000	42,660,000	Arizona	1,170,000	562,000
Idaho	43,470,000	30,590,000	Rhode Island	1,085,000	975,000
New York	29,678,000	27,676,000	New Mexico	480,000	340,000
Minnesota	23,571,000	18,050,000	*7 intermediate potato states*		
Michigan	22,365,000	16,562,000			
North Dakota	22,100,000	17,955,000	New Jersey	11,431,000	10,136,000
Colorado	18,705,000	17,020,000	Virginia	9,594,000	7,242,000
Pennsylvania	18,656,000	17,584,000	Kentucky	4,664,000	4,173,000
Wisconsin	16,368,000	10,050,000	Missouri	3,827,000	4,560,000
Washington	13,200,000	7,800,000	Kansas	2,970,000	2,700,000
Nebraska	12,090,000	12,876,000	Maryland	1,980,000	2,019,000
California	11,480,000	10,880,000	Delaware	308,000	335,000
Oregon	10,335,000	6,825,000	*12 early potato states*		
South Dakota	3,680,000	2,816,000			
Utah	3,430,000	2,312,000			
Montana	2,645,000	1,725,000	California	16,450,000	12,250,000
Wyoming	2,175,000	2,240,000	North Carolina	12,099,000	9,434,000
Nevada	680,000	483,000	Texas	6,450,000	4,675,000
12 other late potato states			Alabama	5,264,000	3,996,000
			Arkansas	4,661,000	3,619,000
Ohio	8,550,000	9,180,000	Tennessee	4,380,000	3,564,000
Iowa	5,238,000	6,600,000	Florida	3,703,000	4,116,000
Indiana	4,100,000	6,480,000	Louisiana	3,599,000	2,520,000
Massachusetts	3,375,000	2,945,000	South Carolina	3,193,000	3,108,000
Connecticut	3,190,000	3,016,000	Oklahoma	2,501,000	2,244,000
West Virginia	2,775,000	3,808,000	Georgia	2,135,000	1,782,000
Illinois	2,170,000	3,528,000	Mississippi	1,904,000	1,917,000

Table II.—*U.S. Sweet Potato Production by Leading States, 1943 and 1942*

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
Georgia	9,375,000	8,000,000	Virginia	2,976,000	3,875,000
Louisiana	8,856,000	5,808,000	Kentucky	1,826,000	1,656,000
North Carolina	7,760,000	8,855,000	Arkansas	1,620,000	1,700,000
Alabama	7,680,000	6,006,000	Florida	1,608,000	1,190,000
Mississippi	6,970,000	6,460,000	California	1,500,000	1,250,000
South Carolina	6,960,000	5,890,000	New Jersey	1,440,000	2,720,000
Texas	5,616,000	3,825,000	Maryland	960,000	1,440,000
Tennessee	4,752,000	3,600,000			

The demand for potatoes for civilian consumption increased. The government's requirements for military and lend-lease purposes were larger than in the previous year. More seed potatoes were set aside for an increased acreage in 1944. All these demands absorbed the supply except in some localities where storage facilities were inadequate to handle the larger crop. Special efforts were made to induce consumers to buy in quantity and store in private cellars. The government's price-support program resulted in heavy purchases which were mostly diverted to canners, starch manufacturers and dehydrators and for relief purposes. Because of storage and transportation difficulties prices were somewhat below ceilings in some localities. Demand for potatoes was expected to continue to increase and a larger crop was recommended by the War Food administration for 1944.

Sweet Potatoes.—A crop of sweet potatoes of 75,801,000 bu. was estimated by the U.S. department of agriculture for 1943, compared with 65,380,000 bu. in 1942, an increase of 16%, and a 10-yr. average of 69,291,000 bu., an increase of 9%. Only once, in 1935, has production exceeded this amount, when 81,249,000 bu. were grown. The yield per acre in 1943 was below the average because of hot, dry weather in August throughout the principal growing areas. Civilian consumption was about as usual—near the average of 23 lb. per capita. Growers were assured minimum prices for the 1943 crop by the government, with loans on potatoes stored in approved warehouses. (J. C. Ms.)

Poultry.

At the beginning of 1943 the principal poultry numbers on farms—chickens and turkeys—were estimated by the U.S. department of agriculture to be: chickens, 540,107,000 head; turkeys, 6,549,000 head.

The number of chickens represented a new high record total, 15% above a year earlier and 28% above the 10-yr. average 1932–41. High egg prices compared with feed prices had encouraged growers to increase their flocks in 1942, particularly for eggs for drying. Egg production was far ahead of any previous year—a total of about 5,000,000,000 dozen, about 12% more than in 1942 and 45% above the average. The number of laying hens were at record levels in all parts of the country. During the last half of the year a heavy culling of flocks was begun which not only improved the average of the flocks and saved feed but also added to the supplies of poultry meat on the markets.

Because of the heavy consumption of poultry near the sources of supply the increase in marketing did not show in the larger city markets. Because of this culling and good feeding the rate of production per laying hen was near the record of 1942 in spite of a decline in quantity and quality of feed. The average was 110 eggs per hen compared with 111 in 1942 and a 10-yr. average of 100 eggs.

An important factor in the improvement of poultry was the National Poultry Improvement plan under the U.S. department of agriculture, which operated to improve greatly the average quality of the chicks raised. Hatcheries and flock owners had to attain certain minimum standards of breeding, disease control and management, to participate in the plan. In 1942–43 there were 69,569 flocks in this plan, covering an egg capacity for hatching 147,048,000, which is equivalent to about 30% of the total capacity of hatcheries in the U.S. Another improvement program, called the Victory Cockerel program, was started in 1943 to improve the male birds in hatchery flocks. It was reported to have reached over 18% of the hatcheries participating in the national plan.

Turkey production was restricted by a shortage of eggs for hatching in the spring and the number raised was about the same as in 1942 and short of the goal of 560,000,000 lb. dressed weight. The crop of 1943 was estimated to be only 480,000,000 lb., or 85% of the goal. While turkey production was above the prewar average, it was much below the demand because of the requirements for the military.

Prices of poultry and eggs were higher than in 1942 and both products sold at or near ceiling prices throughout the year. The production of dried eggs increased about 20% in 1943 over 1942 and was six times as large as in 1941. This use absorbed about 16% of the U.S. production of shell eggs. About 800,000,000 dozen eggs were dried in 1943. (*See* also Eggs.) (J. C. Ms.)

Pound, Sir (Alfred) Dudley (Pickman Rogers)

(1877–1943), British first sea lord, was born Aug. 29 and was educated at Fonthill, East Grinstead, and at The Limes, Greenwich. He was in command of H.M.S. "Colossus" at the Battle of Jutland May 31, 1916, and was mentioned in dispatches for his part in the engagement. From 1922 to 1925 he was director of the admiralty's plans division, and from 1925 to 1927 chief of staff to Admiral Sir Roger Keyes, then commander-in-chief of the Mediterranean fleet. After two years as assistant chief of the naval staff (1927–29) and two years as rear admiral in command of a battle cruiser squadron (1929–31), he was appointed in 1932 as second sea lord and chief of naval personnel at the admiralty. He was advanced to admiral in 1935 and the next year he was named commander-in-chief of the Mediterranean fleet. On May 17, 1939, he was appointed first sea lord and chief of the British naval staff to succeed Admiral Sir Roger Backhouse.

During World War II, he attended all the principal conferences between Prime Minister Churchill and President Roosevelt and participated in the United Nations staff talks. Shortly after his return from the Quebec conference in the summer of 1943, he took ill and on Oct. 4 resigned his naval post. He died in London, Oct. 21.

Presbyterian Church.

The Reformed churches holding the Presbyterian system, within the United States of America, were 12 in number in 1943, and included 18,034 ministers, 18,183 churches, and 3,748,350 communicant members, with approximately 7,500,000 adherents. Outside of continental United States they had, in 1942, 2,148 American foreign missionaries and 13,958 national workers in 21 countries, with a communicant membership of 240,528.

During the year the churches of the Presbyterian family intensified their individual and co-operative work demanded by war conditions. By Dec. 31, 1943, 996 of their ordained ministers were in service as chaplains with the armed forces after approval by the General Commission on Army and Navy Chaplains, of which the churches were members. Unitedly and individually the churches provided material and spiritual help to the chaplains. Through the general commission and other interdenominational agencies, they sent high churchmen on visits to the army chaplains in the various service commands in the United States, and on the invitation of President Roosevelt sent the chairman of the general commission, Dr. William Barrow Pugh, a Presbyterian clergyman, to visit the chaplains on a three months' tour of the theatres of war operations in Europe, Africa, Asia and South

America. Several million dollars in special funds were contributed for spiritual work among soldiers and sailors and in war industry communities, for relief in China, for support of foreign missions cut off from their normal European church income, and for the aid of churches in occupied lands of Europe.

In the oecumenical field, a proposal was being considered for organic union between the Evangelical and Reformed Church and the Congregational-Christian Churches. Further progress was made in negotiations for union between the Presbyterian Church in the United States of America and the Presbyterian Church in the United States (Southern), and between the former church and the Protestant Episcopal Church. Through all of 1943 the churches celebrated, in numerous meetings, the tercentenary of the convening in July 1643, of the Westminster assembly of divines, which formulated the doctrinal standards still being used by Presbyterian churches throughout the world.

Europe.—The national synod of the Reformed Church of France was able to hold its first meeting as a single body since 1939. In session at Paris May 18–20, 1943, the synod sent a formal appeal to the church members for faithful endurance, in a land of "measureless suffering." General enthusiasm greeted the publication earlier in the year of a proposed plan of church reconstruction which included a suggestion for the ordination of a lay clergy. A shortage of ministers was hindering the work in France as in other occupied countries because of forced labour, of internment and of imprisonment, affecting the clergy and theological students. The church continued its aid to refugees in France.

In Hungary, 25 Reformed Church and Lutheran Church leaders, meeting at Budapest June 25, formed the Hungarian Oecumenical council. Its purpose was to intensify the co-operation between the two churches and to establish closer relations with churches of other lands through the World Council of Churches. In Rumanian Transylvania, the situation of the Hungarian Reformed Church was extremely difficult. Handicapped by the prevalent shortage of pastors, the churches were permitted to carry on none of their work except in church buildings, and then only with police present. Despite the losses to the ministry, aggravated by deportation of many theological students to Germany, the Reformed churches of the Netherlands were alert and active. A strengthening of the parishes in preparation for the difficult postwar task of the church was proceeding vigorously. In Belgium also the Reformed Church continued its work, though under the handicap of German occupation. (W. B. Pu.)

Presidents, Sovereigns and Rulers.

The following list includes the names of those holding chief positions in their countries at the beginning of 1944.

Country	*Name and Office*	*Accession*
Afghanistan	Muhammad Zahir, Shah	1933
Albania	Zog I, King (German Regency)	1928
Arabia, Saudi	Abd-ul-Aziz ibn Sa'ud, King	1926
Argentina	Gen. Pedro Pablo Ramírez, President	1943
Australia	Alexander Gore Arkwright, Baron Gowrie, Governor General[1]	1936
	John Curtin, Prime Minister	
Belgium	Leopold III, King (German occupation)	1934
Bolivia	Maj. Gualberto Villarroel, President of the Junta	1943
Brazil	Dr. Getulio Vargas, President	1931
Bulgaria	Simeon II, King (Regency)	1943
	Dobri Boshiloff, Prime Minister	
Burma	Sir Reginald Hugh Dorman-Smith, Governor (Japanese occupation)	1941
Canada	Earl of Athlone, Governor General	1940
	W. L. Mackenzie King, Prime Minister	
Chile	Juan Antonio Ríos, President	1942
China	Gen. Chiang Kai-shek, President of National Gov't	1943
	President of Executive Yuan	1939
Colombia	Dr. Alfonso López, President	1942
Costa Rica	Rafael A. Calderón Guardia, President	1940
Cuba	Gen. Fulgencio Batista y Zaldivar, President	1940
Czechoslovakia	Dr. Eduard Beneš, President (German occupation)	1940
Denmark	Christian X, King (German occupation)	1912
Dominican Rep.	Gen. Rafael Leónidas Trujillo Molina, President	1942
Ecuador	Carlos Arroyo del Río, President	1940
Egypt	Farouk I, King	1936
Eire	Dr. Douglas Hyde, President	1938
	Eamon de Valera, Premier	1932
Ethiopia	Haile Selassie I, Emperor	1930
Finland	Risto Ryti, President	1940
France	Henri Philippe Pétain, Chief of State, Marshal of France (German occupation)	1940
Germany	Adolf Hitler, Fuehrer and Reich Chancellor	1933
Great Britain	George VI, King and Emperor	1936
	Winston Churchill, Prime Minister	
Greece	George II, King (German occupation)	1935
Guatemala	Gen. Jorge Ubico, President	1931
Haiti	Elie Lescot, President	1941
Honduras	Gen. Tiburcio Carías Andino, President	1933
Hungary	Admiral Nicholas Horthy de Nagybánya, Regent	1920
	Nicholas von Kallay, Premier	
Iceland	Sweinn Björnsson, Regent (U.S. Protection)	1941
India	Sir Archibald P. Wavell, Viceroy, Governor General	1943
Iran	Mohammed Reza Pahlevi, Shahinshah	1941
Iraq	Feisal II, King (Regency)	1939
Italy	Victor Emmanuel III, King	1900
	Pietro Badoglio, Premier, Chief of Gov't, Sec'y of State	
Japan	Hirohito, Emperor	1926
	Gen. Hideki Tojo, Premier	
Lebanon	Cheil Bechara El Khoury, President	1943
Liberia	W. V. S. Tubman, President	1944
Liechtenstein	Franz Joseph II, Sovereign Prince	1938
Luxembourg	Charlotte, Grand Duchess (German occupation)	1919
"Manchoukuo"	Henry Pu Yi ("Emperor Kangte")	1934
Mexico	Manuel Avila Camacho, President	1940
Monaco	Louis II, Prince	1922
Morocco	Sidi Mohammed ben Youssef, Sultan	1927
Netherlands	Wilhelmina, Queen (German occupation)	1890
Newfoundland	Sir Humphrey T. Walwyn, Governor	1936
New Zealand	Sir Cyril Newall, Governor General	1941
	Peter Fraser, Prime Minister	
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King (German occupation)	1905
Oman	Sir Sayyid Sa'id bin Taimur, Sultan	1932
Palestine	Sir Harold Alfred MacMichael, High Commissioner	1938
Panamá	Ricardo Adolfo de la Guardia, President	1941
Paraguay	Gen. Higinio Morínigo, President	1943
Peru	Manuel Prado y Ugarteche, President	1939
Philippines	Manuel Luis Quezon, President (Japanese occupation)	1935
Poland	Wladislaw Raczkiewicz, President (German occupation)	1939
Portugal	Gen. António Oscar de Fragoso Carmona, President	1926
	Dr. António de Oliveira Salazar, Premier	
Rumania	Michael I, King	1940
	Ion Antonescu, Premier-Dictator	
Salvador, El	Gen. Maximiliano Hernández Martínez, President	1931
South Africa	N. J. de Wet, Officer Administering the Government	1943
	Gen. Jan C. Smuts, Premier	
Spain	Gen. Francisco Franco Bahamonde, Chief of State, Prime Minister	1936
Sudan	Lt. Gen. H. J. Huddleston, Governor General	1940
Sweden	Gustaf V, King	1907
Switzerland	Walter Stampfli, President	1944
Syria	Shukri Kuwatli, President	1943
Thailand	Ananda Mahidol, King (Regency) (Japanese occupation)	1935
Trans-Jordan	Abdullah ibn Hussein, Emir	1928
Tunisia	Sidi Mohammed Lamine Pasha, Bey	1943
Turkey	Ismet Inönü, President	1938
U.S.S.R.	Mikhail Ivanovich Kalinin, President	1936
	Joseph V. Stalin, Premier	
United States	Franklin D. Roosevelt, President	1933
Uruguay	Juan José Amezaga, President	1943
Vatican City	Pius XII, Pope	1939
Venezuela	Gen. Isaias Medina Angarita, President	1941
Yemen	Zaidi Imam Yahya ben Muhammed ben Hamid ed Din, Imam, King of the Yemen	1934
Yugoslavia	Peter II, King (German occupation)	1934
Zanzibar	Seyyid Sir Khalifa bin Harub, Sultan	1911
	Sir Henry Guy Pilling, British Resident	1940

[1]The Duke of Gloucester was appointed governor general of Australia Nov. 15, 1943, to take office in July 1944.

Price Administration, Office of.

By the end of 1943 nearly the whole price structure of the United States had been brought under control through the General Maximum Price Regulation and more than 500 individual maximum price regulations. Ceilings on animal feeds, fresh fruits and vegetables, used commodities, and on various primary products, most important of which was live hogs, had closed most previous gaps in the price control structure. Maximum prices had been established for most of the materials

going into armament production as well as for essential semi-fabricated and fabricated industrial products. Ceilings had been established on residential rents in defense rental areas in which 80,000,000 people lived.

The Office of Price Administration was created April 11, 1941, by executive order of the president to prevent "price spiraling, rising costs of living, profiteering, and inflation." The agency, known until Aug. 1941 as the Office of Price Administration and Civilian Supply, took over the price stabilization and consumer protection work started by the Advisory commission to the Council of National Defense. On Jan. 30, 1942, the president signed the Emergency Price Control act of 1942 giving the OPA clear statutory powers and providing it with specific authority to enforce its orders. The close to 100 "price schedules" became regulations under the act. On April 28 OPA issued the General Maximum Price Regulation, which set the highest prices charged in March 1942 as ceiling prices on most commodities sold to the American consumer. Price control still remained seriously incomplete, however, chiefly because statutory limitations permitted ceilings on only 60% of the foods in the consumer budget. The Stabilization act, amending the earlier statute, which received the president's signature Oct. 2, 1942, enabled the extension of price control to about 90% of all foods.

In April 1943 the president issued an order directing the price administrator to place ceilings on all cost-of-living commodities, to prevent any further increases so far as possible and to reduce excessively high prices. Following this order a four-point program was entered upon by the OPA:

1. to extend price control across the board, to include a number of formerly exempt commodities such as fish and fresh fruits and vegetables;
2. to reduce prices which had got out of hand, including prices of meats, butter, and fresh fruits and vegetables;
3. to extend the use of specific dollars-and-cents ceilings to include retail foods; and
4. to provide more vigorous enforcement of the program.

Under the third of these points, the community price program was launched during the late spring and summer. This was designed to remedy a serious defect of the General Maximum Price Regulation and the "formula type" regulations under which many commodities had been taken out of the general regulation. This defect, which made compliance at retail difficult, was the lack of a clear and stated price which seller and buyer alike could know to be the legal price. Under the GMPR, ceiling prices were those of a base date and varied from retailer to retailer. Under the formula type regulations, standard calculations were applied to individual cost data, and the resulting calculated price varied from one retailer to another. Under the community price program, the established formulas were applied to costs typical of each class of retail food outlet to arrive at specific prices. These prices, calculated separately for each community, were required to be posted in the retail stores where all parties could readily consult them. At the close of 1943 prices had been set under this program on about 700 food and grocery items in 600,000 retail food stores, 94% of the nation-wide total. Communities covered by the orders included 96% of the population.

Under the new program, ceiling prices for the most important items in the consumer food budget were set on a community basis. Specific dollars-and-cents prices were set for four classes of retail outlets, classified according to volume of business and type of service.

The extension of the dollars-and-cents ceilings was paralleled during the first part of 1943 by the increasing use of quality standards in price regulations. The passage of the Taft amendment to the Commodity Credit Corporation act on July 16, however, prohibited the OPA from requiring grade labelling in any case and from requiring standards except where "absolutely essential to an effective system of fixing prices." Grade labelling requirements were thereupon removed from 20 regulations, and other regulations were revised to assure complete conformity with the congressional mandate. The director of the Office of Economic Stabilization, however, ordered continued the federal grading and marking of carcasses and wholesale cuts of beef, veal, lamb and mutton, which had been recommended and approved by the meat industry.

By the time the "hold-the-line" program had been put into effect, prices on a number of commodities had risen so steeply that emergency measures had to be taken. Rollbacks of some prices were accomplished by reducing inflated margins of distributors and producers. In other cases, however, prices could not be reduced without also reducing margins or farm returns below reasonable levels. In such cases subsidies were authorized by the director of the Office of Economic Stabilization in order that the reduction of retail prices would still permit a fair return to producers and distributors. The reductions were financed by the Commodity Credit corporation and other agencies having funds available for the purpose. Subsidies introduced during 1943 kept down the retail prices of a very significant group of cost-of-living staples, including meats, butter, cheese and milk, apples, bread and flour, peanut butter and certain canned vegetables. The net result of the program as a whole was apparent in the fact that, despite rising inflationary pressures, the cost of living, as reported by the bureau of labour statistics, rose only 3½% during 1943, as compared with 9% in 1942 and 10% in 1941. Whether or not subsidies would be continued in the control of food prices was still to be decided by congress at the end of 1943.

Rationing during 1943 assumed an increasingly significant place in American life with the inclusion under the program of shoes, processed foods and meats, fats, oils and cheese. In general, commodities like fuel oil, automobiles, supplementary gasoline, etc., were rationed differentially according to individual need and essentiality to the war program. The basic gasoline ration, shoes and all foods, however, were rationed according to the principle of equal division of available supply among all consumers. During the summer of 1943, local boards were given authority to grant additional quantities of food ration points to people living or working in isolated areas who could not otherwise get a nutritionally adequate diet.

An important development in the rationing program during 1943 was the growth of the ration banking plan worked out in co-operation with the American Bankers' association. The plan enabled retailers, wholesalers, primary suppliers, bulk consumers, and institutional and industrial users to deposit their ration currency in co-operating banks and to make and receive ration payments in the form of checks. About 84% of the U.S. commercial banks participated in the program. Most of the banks that did not participate were small ones in rural areas where there was no need for the program.

Administrative policy during 1943 stressed the elimination of complex administrative procedures, the simplification of regulations, and the reduction of paper work. Marked emphasis was laid on the need for decentralizing the program. During the last months of the year there was considerable restaffing of the Price department in order to comply with the legislative provision incorporated in the appropriation act for 1944 that all key policy positions in the agency be held by men who "in the judgment of the administrator . . . shall be qualified by experience in business industry or commerce."

Active co-operation and participation of the general public in the OPA program was more fully enlisted during the year. Price panels, made up of local volunteers, were established in the War Price and Rationing boards throughout the United States to promote compliance with the regulations among retailers and con-

sumers in the community and to provide a channel for the consideration and settlement of consumer complaints. Closer relations with industry were brought about through a substantial increase in the number of industry advisory committees set up to iron out special problems and to further the exchange of viewpoints between the agency and the business world. A labour office and an Industry council had been established prior to 1943. An agricultural relations advisor was appointed during the year to promote better understanding between the OPA and U.S. farmers.

A Consumer Advisory committee was also appointed to study the effects of OPA policies on the consumer and to advise with operating people on how policies and regulations might be made more effective.

Leon Henderson, who had been OPA administrator for nearly two years, resigned on Jan. 20, 1943, and was succeeded by Prentiss M. Brown. On Nov. 8, Mr. Brown resigned and Chester Bowles, who had been general manager since July, became the third OPA administrator. Prices. The general level of U.S. commodity prices moved higher in 1943, but the trend of prices for particular commodities varied widely from this general level. Inflationary forces appeared in the expansion of governmental purchases for war needs, the rapid rise in the quantity of money in circulation in purse and pocket, the abnormal increase in the amounts held by individuals and corporations as demand bank deposits against which checks could be drawn, and in the rapid rise in the amount of paper money in common use. These factors were reenforced by influences tending to increase the prices of particular goods, in the form of black markets, increasing scarcities of civilian supplies, and the abrupt increases in items over which price control measures were not taken by the government, such as furs, whisky, used cars, jewellery, corporate stock and land values.

During 1943 certain inflationary offsets developed, such as a decline in the velocity of circulation of money, the withholding of consumers' purchasing power under the tax collection process of the individual income tax, improvement in administration of price control, rationing of consumers' goods, adjustments under the controlled materials plan, and increased individual and corporate savings and investments in war bonds. Taking into consideration only items entering into the cost of living index, the effectiveness of price control over particular prices was found in the declining rate of increase from 3% per quarter in 1942 to 2% per quarter in 1943.

The demand factors underlying 1943 price changes could be observed in the expansion of consumers' purchasing power, as seen in Table I. The danger of inflation was a common topic of study in 1943. The amount of money that the consumer had in his pockets and at the bank was an important factor determining what he could but not what he would pay in his demand for goods supplied. The billions of dollars in circulation shown in Table I indicates that the amount of money in consumers' pockets tended to rise throughout 1942 and continued unbroken through 1943. Considering only the dollars per capita in circulation, the inflationary trend was still more striking, rising from $116 in January to $141 in October. The rate of increase, however, tended to decline in 1943. The velocity of the bank deposits, showing the number of times during the month that a dollar had been exchanged for goods and services, showed a definite downward trend. The turnover of dollars was based on the relation of debits of individual accounts to net demand deposits in member banks reporting weekly for the 100 leading cities.

The 1943 dollar passed through fewer hands than did the dollar of 1942 or 1941. The monthly average for 1941 showed a turnover of 22.5, for 1942 of 21.5 and for 1943 of 21.1. The purchasing power of the dollar declined slightly during the first quarter of 1943, but perhaps no data indicated more clearly the extent of the success of price control, taxation and rationing, than the stability of purchasing power of the dollar for the remainder of the war year.

Despite the increase in pocket money and in bank deposits, constituting what many financial experts called the "inflationary potential," the value of the dollar remained sufficiently stable to allay fears of inflation for 1943.

The greatest single U.S. buyer in 1943 was the federal government. The expenditures of the United States constituted a powerful demand influence, and as these monthly expenditures increased, the strain upon price control became correspondingly greater. On the other hand, the receipts from taxes indicated the extent to which the government was mopping up the consumers' purchasing power shown in Table I. Federal taxes were deflationary; federal expenditures were inflationary. Since the federal government commanded four-fifths of physical production in 1943, the fiscal policy was inevitably related to the price control policy. Table II affords a clear-cut understanding of the relative importance of the deflationary effect of taxes, and the inflationary effect of expenditures for the war years.

Although federal expenditures exceeded revenues every month during 1943, the increased funds pouring into the treasury after July became a substantially larger proportion of outlays. The

Table I.—*Composition and Comparative Trends of Purchasing Power, 1943 and 1942*

Month	Money in Circulation				Deposits (except inter-bank accounts) (in billions)		Velocity of bank deposits		Purchasing power of dollar as measured in wholesale prices	
	Billions at end of month		Dollars per capita

Federal Reserve *Bulletin*. Purchasing power of dollar computed by bureau of foreign and domestic commerce, on basis of 1935–39 wholesale prices. *Estimated.

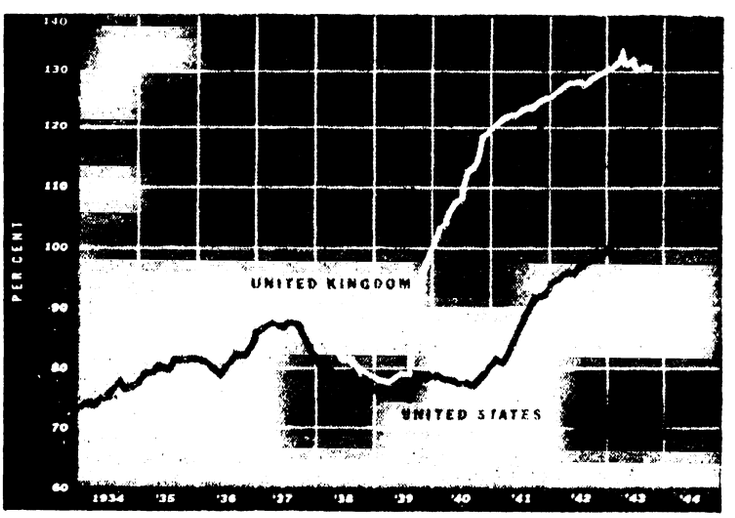

Fig. 1.—WHOLESALE PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–43 (Sources: United Kingdom—Board of Trade, converted to 1926 base; United States—Bureau of Labor Statistics). War conditions in the United Kingdom made many price quotations nominal; undoubtedly the index for that country understates the price rise after August 1939

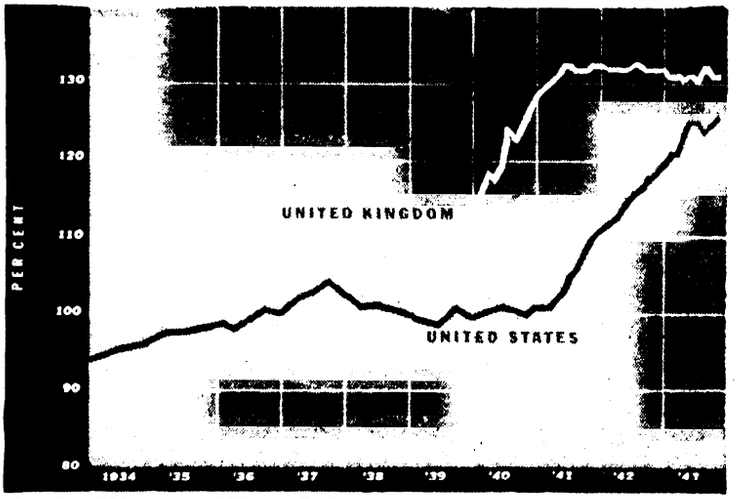

Fig. 2.—RETAIL PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–43. (Sources: Cost of living indexes. Ministry of Labour, converted to 1935–39 base, first-of-month data; Bureau of Labor Statistics, mid-month data, selected dates before Sept. 1940.) Because of the war, the price rise shown for the United Kingdom after 1939 and, to a lesser extent, for the United States after 1941, is probably understated

withholding method of income tax collection strengthened the anti-inflationary power of taxation to the extent shown in Table II. As this difference between the inflationary effects of expenditures and the deflationary effects of taxation became less and less, federal fiscal policy became an important price control factor.

The Office of Economic Stabilization (*q.v.*) confronted two difficult price problems, in the form of demands for increased wages, based upon alleged increases in living costs, and requests of producers of particular commodities for price increases to cover rising costs of production. The president's order to "hold the line" was rigidly followed by both the War Labor board and the Office of Price Administration. The Little Steel formula, basing wages on living costs, came under severe strain in the fourth quarter of 1943, with demands from coal miners, steel workers, and railroad brotherhoods, where increased costs of fuel and transportation would have been widely reflected in costs of other goods. The shortage of crude petroleum led to a demand for an increase of 35 cents per barrel by producers, but the request was refused because profit margins were favourable, the industry showed good earnings for 1943, the cost of oil entered too extensively into other costs, and it was doubtful if such an increase would have added substantially to successful explorations of new reserves. During the fourth quarter of 1943, however, more requests for price increases were granted in particular industries than at any other time during the year.

Subsidies for price control purposes were used more extensively during 1943 than in previous years. The U.S. government purchased abroad such important metals as antimony ore, copper, tin, bauxite, chrome, manganese and mercury, which were then sold in domestic markets at ceiling prices, but below landed costs. Since these metals were resold largely on government account, the losses were largely fictitious whenever the government sold below cost for public use. Public opposition to direct governmental purchases and resale led to direct payments to sellers and producers. The "roll-back program" of May and June, 1943, was designed to roll back the prices of meat, coffee and butter by 10% to check rising living costs. Payments were made to processors, *e.g.*, creameries and slaughterers, who in turn agreed to sell to retailers at lower prices. Farmers protested that these subsidies did not benefit them but only the processors who obtained windfall gains therefrom.

Table II.—*Comparison of Federal Inflationary Expenditures and Deflationary Taxes, 1941-43*

	Expenditures by months (in billions)			Revenues by months (in billions)		
	1943	1942	1941	1943	1942	1941
January	$6.37	$2.63	$1.12	$ .82	$ .61	$.34

Other Countries.—Compared with the prewar average (Jan. to June, 1939) the prices of goods entering into the cost of living index of the League of Nations had risen in the second quarter of 1943 as follows: 274% in Turkey; Palestine, 237%; Iran, 203%; Bolivia, 206%; India, 95%; Finland, 86%; Chile, 84%; Spain, 66%; Norway and Sweden, 50%; Mexico, 49%; Peru, 43%; Japan, 33%; United Kingdom, 28%; the United States, 24%; Argentina, 21%; Canada, 18%; Germany, 11%. In Chungking, China, the cost of living in 1942 was 2,149% above 1939 levels. Between Aug. 1942 and 1943, the wholesale price index of the London board of trade rose from 128.2 to 130.9, indicating that firm price control had been in effect in England. (*See* also AGRICULTURE; BUSINESS REVIEW; CONSUMER CREDIT; PRICE ADMINISTRATION, OFFICE OF; STOCKS AND BONDS; and articles on individual commodities.) (E. H. HE.)

Primary Education: *see* EDUCATION.

Prince Edward Island.

The smallest of the Canadian provinces lies in the Gulf of St. Lawrence. The island is about 130 mi. long, and has an average width of 21 mi. Pop. (1941) 95,047, predominantly rural. The largest city is Charlottetown (14,460), the provincial capital.

History.—On Sept. 15, 1943, the provincial general elections were held. These resulted in the continuance in power of the Liberal party, which gained practically a two to one majority over its chief opponent, the Progressive Conservative. The prime minister in 1943 was T. Walter Jones, who succeeded Thane Campbell on the latter's elevation to the chief justiceship of the province in May.

Education.—The two chief educational institutions of Prince Edward Island are Prince of Wales college and St. Dunstan's university, both situated at Charlottetown.

Communication.—Communication with the mainland across Northumberland strait is maintained by powerful railway ferryboats. The Trans-Canada airway also provides communication by plane twice daily between Charlottetown and Moncton.

Agriculture, Fisheries, Fur Production.—About 85% of the entire surface of the island is arable. During 1943, farming conditions were good, with the hay and grain crops excellent. The potato crop, because of excessively wet weather, was below average. The fishing industry represented a considerable advance. In 1942, the total value of the catch was $1,148,367 as compared to $758,464 in 1940. The fur haul of the island in 1941–1942 represented a value of $735,189. (J. I. C.)

Princeton University.

An institution of higher learning at Princeton, N.J. During 1943—its 197th year—Princeton became practically a military installation. It was a "pilot" institution for the basic and area and language courses of the army specialized training program and later received engineering and reserve details. Units of the navy and

marine corps college training programs (V-12 and pre-medical) were also assigned to it. In addition, it continued to provide accommodations for a navy school for the indoctrination of officers and an army post exchange school. While the campus population was 1,000 larger than it had ever been, the civilian enrolment was reduced to one-quarter of normal.

In addition to carrying the increased burden of instructing the uniformed students, the faculty members continued to pursue war research projects and to lend their assistance to government agencies. Under wartime pressure the new department of aeronautical engineering was rapidly developed and new buildings were erected for it. Programs of study in the near east and Latin America were expanded. First steps were taken in the framing of a postwar plan of study and curriculum. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (H. W. Do.)

Principe: *see* PORTUGUESE COLONIAL EMPIRE.

Printing. With U.S. manufacturers concentrating on war-making equipment and materials, no big printing machine development was announced during 1943.

Interesting developments—some with reasonably high potentialities—centred around substitutes for zinc and copper, widely used in war and printing alike.

As substitutes for electrotypes (copper face on lead base) and for offset press plates (ordinarily of zinc or aluminum) plastics were noted in 1942. Use was extended in 1943; the material was found practical for moulding electrotypes, accepting the copper shell (face) by electro deposition with silver the conductor rather than black lead used with customary wax mould. The silver, incidentally, eliminates dirt accompanying black lead.

A method of depositing iron as well as copper or nickel was evolved. The Sept. 1943 *Better Homes and Gardens* was produced from plates the shells of which were formed by alternating layers (deposits) of nickel, iron and copper respectively, saving considerable copper. Iron being three to four times harder than nickel, an iron shell of one to one and one-half thousandths of an inch is sufficiently tough to give extremely long press mileage.

Soon, it was predicted, neither zinc nor copper (or any combination of the two) would be used for original photo-engraved plates. Experiments with soft iron, Dow metal, magnesium and other metals were made. It was predicted that such originals would be engraved faster and more economically by electric etching, eliminating use of nitric acid. Three newspapers set up to make plates in this fashion but the supply of zinc was reduced by half and the nitric acid situation was relieved. The etching of plastic materials was not found practical up to the close of 1943, but development was going on.

During 1943 duPont announced "Dacolyte" for copper electro forming applications. The addition of but one-third to two-thirds ounce per gallon of solution contributed toward improved deposits; surface irregularities of the copper were practically eliminated and the deposit was tougher and harder.

A similar material, B.C.F. addition agent, developed particularly for electrotypes, effected a considerable saving in copper. Because of the increased hardness, a thinner copper plate shell could stand the same, or increased, press wear. Use of this product enabled electrotypers to produce one-third more square inches per pound of copper than the average 1942 production on which allotment of material was based.

A quite notable advance in colour photography came with development of Ansco colour paper print. It was said to be the first paper from which finished colour prints could be made by exposure to three colour separation negatives in turn and development in an ordinary dark room. Essentially the base paper carried three emulsion layers, each having a colour-forming compound which coupled with the reaction products of development. The result was a transparent die image.

Inability of operators of fast multicolour presses ("wet" printing) to match engraver's colour proofs (different colours being proofed slower than on production presses) had long been troublesome. To permit the printer to match engraver's colours with proof presses which were not too high-priced, a new 2-colour proof press using a single impression cylinder with inking units arranged to ink the plates immediately before impression, was built by Vandercook. A 4-colour proofer was in development.

(J. L. F.)

Printing Office, U.S. Government. The office was established by authority of congress in 1860 to execute printing and binding for congress, the executive and judicial departments. The total area occupied by the government printing office proper in 1943 was 1,396,973 sq.ft., or 32.1 ac. In addition, the government printing office occupied 7 warehouses in various sections of the U.S. covering 125,237 sq.ft. of floor space or 2.9 ac. During the fiscal year 1943 it was necessary to place orders with outside contractors for printing in the amount of $25,944,709.57, as the government printing office was unable to handle the volume of printing necessary in connection with the war. The value of the government printing office buildings in 1943 was $9,634,825; machinery and equipment $6,236,731, making the total value of the plant $15,871,556. At the close of the fiscal year 1943, there were 7,973 employees on the rolls with a pay roll of approximately $21,900,000. During the fiscal year 1943, this office made charges for 821,787,445 copies of publications of all classes. This total included 9,087,829 copies of the *Congressional Record*, 5,191,000 copies of the *Federal Register*, 4,394,822 copies of specifications of patents, trademarks, designs, etc., and 251,726 copies of the patent office *Official Gazette* and annual indexes. The number of postal cards printed amounted to 2,268,321,000 and money orders 297,083,308. The stores division and warehouses handled 7,668 carloads of paper weighing 345,204,321 lb. The division of public documents mailed out 802,384,327 publications and forms; its receipts from the sale of government publications during the year amounted to $2,366,897.04. The total charges made to congress and all other government agencies during the fiscal year were $77,837,186.54. (A. E. Gi.)

Priorities and Allocations. Wartime industrial production in the U.S. brought adoption of various systems by the War Production board, each of which was designed to bring about orderly flows of materials to manufacture of military and essential civilian products. As a background to 1943 developments, the Office of Production Management had instituted the simple priorities system of a first-things-come-first variety. This method of distributing materials was successful during the early prewar period, when real materials scarcities had not appeared in the U.S.

Manufacturers of most urgently needed war and civilian items needed assurance that their orders would be filled in preference to orders from manufacturers whose output was not as important. As a consequence, the system of preference ratings was adopted. Orders for materials bearing the highest preference ratings were required, under rules and regulations of OPM to be filled prior to orders bearing lower ratings.

The system originally included preference ratings of A-1, A-2, A-3, A-4, A-5, etc. These ratings were assigned to important war and essential civilian items on the basis of relative urgency patterns laid down by the War Production board and military agen-

cies. However, the pressure from various groups of producers soon brought about a classification of more items among the top preference ratings than was actually warranted. Since many producers received ratings of A-1 or A-2, it was impracticable to lower the ratings applicable to their operations from the relatively high classes to lower ones. Therefore, it was decided to establish intermediate ratings between the A-1 and A-2 groups, including A-1-a, A-1-j, and A-1-k, etc.

Ultimately, the priorities system was still further "inflated" through inclusion of large segments of war and civilian production programs in these higher ratings groups so that eventually, it became necessary to modify the entire system by establishing a new group of ratings, to top all other ratings. This new group included AA-1, AA-2, AA-3, AA-4, AA-5, etc. In addition an AAA preference rating was established for use in cases of emergency only.

At the same time that the AA preference rating scheme was established, the A group was retained as a lower series of ratings. Eventually, an intermediate rating between AA-2 and AA-3 was established as AA-2X, in order to permit adjustments between the highest classification of relative urgency.

As materials became increasingly short in the U.S. productive system, the demands of producers holding relatively high preference ratings became so great that all of their demands for basic materials could not be met from available supplies. As a consequence, it became necessary to take steps to assure that the amounts of basic materials which might be purchased through the use of preference ratings was no greater than the available supply. There had to be a balancing of demands for materials with supplies of them, in order that the most essential war and civilian programs might be met, according to a prearranged time schedule.

The Production Requirements plan was developed during 1942 to make materials for production of war and civilian items available under quantity controls on a plant basis. The quantities of materials which plants might purchase for production of the items they were manufacturing, however, were unrelated insofar as the end products themselves were concerned. For example, under PRP, the X company might be eligible to purchase 500 tons of steel for the manufacture of 1,000 parts for an aeroplane. At the same time, the Y company might be eligible to purchase only 200 tons of aluminum for the manufacture of 300 parts for the same aeroplane There was no co-ordination between the numbers of parts which might be made for a given war program—the aircraft program for example. As a result, a situation eventually developed wherein a production period would end and there would be aeroplanes without propellers on hand, tanks without tracks, and ships without fittings. In order to correct this situation, it became necessary to make materials available to war and essential civilian industries on a program basis. Thus, materials in 1943 were made available for the production of aeroplanes, rather than to individual plants for the production of unrelated numbers of parts for aeroplanes.

This method of program distribution was implemented by the Controlled Materials plan, announced in Nov. 1942, and placed in operation during the second quarter of 1943. It became popularly known as CMP. In its essentials, CMP was a method of vertical allocation of basic critical materials—specifically, copper, steel and aluminum in specified forms and shapes. The plan also included the preference rating structure, under which other materials required for production programs were made available within quantity controls. CMP worked as follows in 1943:

Statements of supply of and demand for controlled materials, on the basis of production programs, were made to the WPB requirements committee. Estimates of supply were made available to the committee from products of controlled materials—and producers of other critical materials playing an important role in production of war and essential civilian goods.

Statements of demand were presented to the requirements committee by the claimant agencies (war department, army ordnance, navy department, Maritime commission, Aircraft Resources Control office (agent for army air forces and bureau of aeronautics of United States navy), Office of Lend-Lease administration, Office of Economic Warfare, Office of Civilian Requirements, department of agriculture, Office of Defense Transportation, Office of Rubber Director, Petroleum Administration for War, National Housing agency, Office of War Utilities Director). In 1943 these were U.S. government agencies responsible for planning war and civilian production.

The statements of supply and demand were then compared and adjusted in order that more materials would not be allotted for production than were actually estimated to be available for a coming quarterly production period. As a result of this adjustment, programs of the various claimant agencies were adjusted in order that they would fall within the available supplies of materials allotted to them by the requirements committee. The claimant agencies then, on the basis of applications for allotments filed with them, made allotments of controlled materials to class A product manufacturers, consumers of controlled materials.

In addition, the requirements committee made allotments of controlled materials to WPB industry divisions, which in turn made allotments to manufacturers of class B products.

A distinction between products was drawn, because of the fact that it was feasible to make allotments of materials on a vertical basis in only some instances—chiefly where large end items were involved, with relatively large component parts. Class B products were usually products of a relatively standardized nature, having the general character of shelf goods. While this distinction was not specific, the classification of products was of necessity somewhat arbitrary. Practically, to determine the distinction, it was necessary to refer to the official CMP class B product list. This list indicated what items were class B products. Any item which did not appear on the list was a class A product.

The distinction was important, because it indicated the method to be used in making allotments—class A products being subject to the vertical allotment procedure down a chain of manufacturers, and class B products being allotted for directly by WPB industry divisions In essence, an allotment of controlled materials was authority to purchase the items covered by it. In the case of class A products, the manufacturer of the end item (for example, tanks, or aeroplanes, or ships) obtained his authority to purchase controlled materials from a claimant agency. He then was in a position to place an authorized controlled materials order with a producer or distributor of controlled materials. He was also in a position to grant allotments (authority to purchase controlled materials) to other producers supplying him with class A products

When a manufacturer received an allotment of controlled materials, he also received an authorized production schedule and a preference rating With the preference rating he could purchase class B products and other items (other than class A products or controlled materials) in amounts necessary to fill his authorized production schedule under the allotment which he had received.

Class B product manufacturers received allotments of controlled materials, authorized production schedules, and preference ratings direct from the industry divisions of WPB. They, in turn, could make allotments of controlled materials to manufacturers who supplied them with class A products, use the allotments, or parts of them to place authorized controlled materials orders with controlled materials producers or distributors, and use their preference ratings for the purchase of class B products and other items (except class A products and controlled materials) in

amounts necessary to meet their authorized production schedules. Manufacturers of class A products had to receive an allotment of controlled materials, a preference rating, and an authorized production schedule in order to be in a position to produce and deliver class A products. However, manufacturers of class B products need only to have had a preference rated order in order to make deliveries of their class B products.

The over-all basic idea of CMP in 1943 was control of the entire basic raw materials distribution system through rigid control in the form of allotments of specified forms and shapes of three basic materials and through related controls governing the remaining materials.

While CMP was the outstanding example of the allotment procedure in 1943, other materials were subjected to specific types of allotment. For example, chemicals, textiles and woodpulp were subject to allotment procedures not forming an integral part of CMP, but operating along with it.

These forms of allotments followed the general scheme laid down under CMP, but did not always include the vertical aspects. In most instances, allotments were direct from WPB industry divisions to users of the products covered. Prisoners of War. Although there were no official figures available for the total number of prisoners of war during 1943, it was estimated that more than 4,000,000 were held captive during the year. The largest part consisted of Russians held by Germany and axis forces held by the U.S.S.R., but estimates of actual numbers were erratic. Some 200,000 former French prisoners of war in Germany were transferred to other categories during the year, reducing the number of French prisoners of war to 872,000. Proportionately, the largest increase in prisoners during the year was in the number of Americans held in Europe. Whereas in 1942 it was estimated that there were 500 such prisoners, the 1943 figures total some 11,000, consisting of survivors of planes shot down over Europe and captives taken during the North African and Italian campaigns. Figures for prisoners of other Allied nationalities held in Europe remained fairly constant, including 142,000 British, 140,000 Yugoslavs, 66,000 Belgians, 55,000 Poles, 9,500 Dutch, 1,500 Greeks and 1,100 Norwegians. Among axis prisoners held by the United Nations, it was estimated that 193,000 were held by the United States, 74,000 in Great Britain and 27,000 in Canada. In the Far East, estimates showed that Japan was holding approximately 20,000 American prisoners, 148,000 British and 45,000 Dutch, as well as some 50,000 civilian internees.

In accordance with the terms of the Geneva Prisoners of War convention of 1929, ratified by most of the belligerents of World War II, representatives of the protecting powers and of the International Red Cross committee continued to visit prison camps and to report on the application of the convention. In general, these reports indicated that the convention was being observed.

The convention, which had not been ratified by Russia or Japan but which Japan agreed to observe without formal ratification, established certain standards for the treatment of war prisoners. Food was to be the equivalent of that of troops of the detaining power at base camps. Sanitary and medical facilities were to be provided. Prisoners might be held in compounds but not individually confined except under unusual circumstances. Officers were to receive pay, generally on the same scale as officers of corresponding rank in the army of the detaining power. Prisoners other than officers might be required to work at an agreed-upon rate of pay, but the work should have no direct relation to war operations. Neutral representatives might visit the camps. Facilities for the exchange of correspondence with relatives at home were to be provided and prisoners might receive packages. Exemption from postal charges was granted. The convention further provided for the exchange of information about prisoners through bureaus in each belligerent country and a central information bureau in a neutral country.

Supplies of food, uniforms, medicines, to supplement those of the detaining power, and educational, recreational and religious articles continued to be supplied to war prisoners by governments, Red Cross societies and other agencies through the intermediary of the International Red Cross committee. Regular shipments were made on vessels operated by the committee to and from Europe, but the Japanese government continued to interpose objections to the establishment of regular shipments of such supplies to the Far East. Substantial quantities were sent to Japanese-controlled territory during 1943, via the exchange ships which met at Goa in India in Sept. 1943. Reports received late in 1943 showed that these supplies were reaching Allied prisoners and civilian internees in Japan and Japanese-occupied territory, including the Philippines.

Various proposals were made to Japan by Allied governments and Red Cross societies to establish facilities for the regular dispatch of relief supplies for prisoners in the Far East. Stores were built up in Vladivostok in the hope that Japan would agree to their onward passage and distribution. By the end of 1943, however, the Japanese had not yet agreed to any of these proposals. Efforts by the Allied governments and Red Cross societies were being continued.

Delegates of the International Red Cross committee observed the distribution of supplies in prison camps, and receipts signed by the prisoners and their representatives were returned to the senders. It was estimated that less than 1% of the relief supplies sent to prisoners of war failed to reach the proper destination. Neutral representatives of the Young Men's Christian association continued to be allowed permission by most of the belligerents to visit prison camps and assist in educational, recreational and religious activities.

Some improvements were made during 1943 in the facilities for the exchange of correspondence between prisoners and their families, although the only provision for sending parcels to prisoners in the Far East was on the one sailing of the exchange ship "Gripsholm." Instructions for communicating with and sending parcels to prisoners were changed occasionally, but in the United States the latest information was obtainable from post offices, Red Cross chapters and the office of the provost marshal general, Washington, D.C. (P. E. R.)

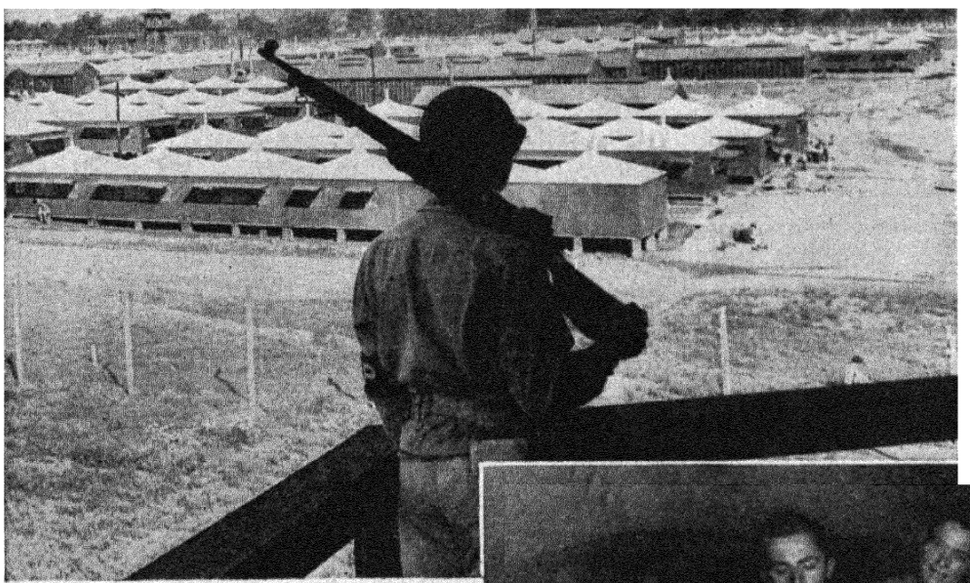
Prisons. Reports revealed that U.S. state prisons in 1943 manufactured products for armed forces amounting to $14,000,000 (in addition to $21,000,000 worth for state use) from Aug. 1942, to Nov. 1943. They included: bomb noses; bomb racks; shirts and other clothing; tool boxes; submarine nets; blankets, etc. The federal institutions produced war matériel valued at over $18,000,000 for the year ending July 30, 1943.

In addition, various penal farms raised about $25,000,000 worth of produce (meats, vegetables and fruits), and in many instances, inmates volunteered to work on private farms because of manpower shortages. No escapes were reported. Institutions also did laundry, salvage and repair work for nearby army camps.

It should be emphasized that patriotism on the part of the inmates, not compulsion, was responsible for this record. As of Nov. 1943, the prison industries branch of the War Production board awarded National Service certificates (comparable to the army and navy "E") to 44 institutions.



GIRL CLOTHING WORKER in Montreal, Canada, measuring a jacket for an axis prisoner. A large red circle on the back identifies the wearer as a war prisoner

GERMAN ARTIST, a prisoner of war, sketching a U.S. naval officer aboard a ship en route to the United States in 1943

Additional reports revealed that thousands of inmates gave blood to Red Cross banks; some acted as "guinea pigs" to the cause of science (one died as a result). Prisoners also purchased more than $1,000,000 worth of war bonds from their paltry earnings in prison industries.
